FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, JANUARY 7, 1899.

VOL. LII.—No. 1.
No. 846 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

The Forest and Stream Platform Plank.

"The sale of game should be forbidden at all seasons."
—FOREST AND STREAM, Feb. 3, 1894.

Taking the average of shooting companions, however (except to beat a double hedge-row, or divide what could not be seen on both sides), I should pardon any old sportsman for saying that he would rather have their room than their company.
Col. Hawker.

EXTENDING THE NATIONAL PARK.

EARLY in 1898, Col. S. M. B. Young, then acting superintendent of the National Park, submitted to the Secretary of the Interior a bill for the enlargement of that reservation. This bill was intended to give exact expression to one of the recommendations made by Col. Young in a report made to the Secretary at the same time. In due time the bill was submitted to Congress and introduced in the Senate. Since then petitions have been received by the Department of the Interior from residents of the State of Wyoming, asking that certain lands to the south of the present Teton forest reserve be added to it, and that this territory be constituted a new National Park, to be managed separately from the Yellowstone Park.

The boundaries suggested in Col. Young's recommendation would extend the limits of the Yellowstone National Park so as to include the Yellowstone timber land reserve, and all that portion of the Teton forest reserve lying east of the summit of the Teton range, together with two small unreserved tracts at the southwest and the northwest corners of the National Park. The sum of these areas is about 3,260 square miles, and the addition if made would thus come near to doubling the area of the National Park.

In the country proposed to be added to the Park there are a few settlers and a few undeveloped mines. It is chiefly a timbered mountain country, and does not run far enough south to take in the real winter range of the southern elk herd. It is, however, a country abounding in game and in fine timber, and so is well worth preservation and improvement. Its addition to the Yellowstone Park would greatly increase the range of the game and would work no hardship to any *bona fide* settlers, whose claims might easily be adjusted at a later day.

Should such an enlargement be sanctioned by Congress, considerable additions ought to be made to the force of troops now caring for the Yellowstone Park. A permanent post—though not necessarily a large one—should be built somewhere near the southern boundary of the Park, since the patrols who work during the winter should not be obliged to make the long journey on foot from the Mammoth Hot Springs to the southern borders of the reservation. These regular troops, while no more perfect than other men, still constitute the most efficient guardians that can be had for the Yellowstone Park. The Commissioner of the General Land Office says, "The superior discipline of regular troops makes a more effective patrol than the civil forest officers, and cavalry can cover greater extent of territory with more expedition and is better able to cope with trespassers than are forest rangers." The first part of this statement is undoubtedly true, but the last does not take account of the fact that the trespassers most to be feared work in winter, at a time when cavalry is not available. On the other hand, a cavalry force is much better equipped to fight fires than are civil forest officers under present conditions.

The importance of protecting these forest reservations

and the game which ranges in them is recognized alike by residents of Wyoming and by sportsmen all over the land. Both these classes are agreed that this ought to be done. If Congress should enact such a measure, the protection of game in the Park would, of course, be left, as now, to the general Government, while on the residents of the settlement of Jackson's Hole and its vicinity must fall the burden of protecting the game which migrates south during the winter to feed in the warm low country where the settlements are and beyond. We believe that this task may safely be left to those residents. Many of them are thoroughly alive to the importance of enforcing the law and caring for the game on general principles, and many others who take a narrower view are well aware that the destruction of the game would result in depriving them of a considerable income which they will receive each year from visiting sportsmen, so long as game can be had in their vicinity.

In view of the short time that remains of the present session of Congress, it is not likely that action will be taken on this bill unless a concerted effort shall be made to bring it forward both by sportsmen and by residents of Wyoming. The views of the latter are likely to have more weight with Congress than those of even a larger number of men scattered over the country, because the inhabitants of Wyoming are more immediately concerned in it than others. Whatever action may be taken looking to the pressing of this measure should not be delayed.

SNAP SHOTS.

Some months ago came a disquieting rumor of the death of old John Gomez, of Panther Key, off the Gulf Coast of Florida. Now Tarpon writes us from Tarpon Springs that the yacht Maud, Com. Knapp, has just returned from a cruise to Miami, and having called at Panther Key, found Gomez not only alive, but spry and vigorous, notwithstanding his 117 years. He still paddles his own canoe, and manages his boat for himself when fishing and turtling. "It is easy to see that he has failed somewhat," says Com. Knapp, "but his courage is such that he will not admit any weakness." Good fortune to the old man; to bespeak for him long life were superfluous.

Our Boston correspondence reports that a movement is on foot among Maine guides to form an organization for mutual benefit. As we have pointed out, there is much which might be accomplished for the betterment of the guides, should an organization prove practicable. For one thing, some way ought to be devised to distinguish between competent guides and the incompetents. Under present conditions, as the guide license law works, all guides are put on a level with respect to the license system. And just as under the Maine medical regulations a worthless charlatan may buy a physician's license and under its authority start in and kill people, so under the guide law an incompetent and ignorant and not always sober bar-room loafer at Kineo is free under shield of his license to engage himself as a guide to uninformed sportsmen, take them into a country where they would not see game in a thousand years, keep them in camp for the stated period, and in the end rob them by taking their money for services not rendered. As we have said in the past, the efficient and honest guides should devise some way to rid the craft of these fellows for good and all.

The guide license idea is taking hold in the West; it is a feature of the elaborate measure proposed by Mr. Beaman for Colorado. If a license were evidence of capability on the part of the one holding it, the system would be warmly approved by non-resident sportsmen.

The purist is on hand again with his fanciful grievance over the use of the term "hunting" for "shooting." There is a distinction between the two, but one not commonly observed in this country, where hunting covers everything from the pursuit of the grizzly or the moose to the shooting of quail and hares. In years to come sports may so develop in America that we shall be required to observe the niceties of speech in referring to them; but it will be a long time before the word hunting shall be limited to the practice of riding to hounds. For the most part that use of language to describe field sports is best which is simplest and least affected. The technical distinctions

between flocks and bunches and herds and gaggles are hardly known to the present generation. Pedantic writers have written learnedly and oracularly of correct sporting diction, but for the most part their well intended efforts to reform the language have been dissipated in the upper air, leaving no spoor behind.

There was one circumstance in the early history of William and Mary College which our Boston contributor might well have added to the notes he sends of that historic institution. In the early days of the Colony of Virginia deer were extremely abundant, and one of the industries first developed by the settlers was the gathering of deer skins and their preparation for export to the mother country; and when William and Mary College was founded one source of revenue for its support was provided by the imposition of a tax on deer skins. This York River country of which our correspondent writes is one of the most interesting on the continent for its historical associations, running back to the time of sturdy Capt. John Smith.

When the Maine moose season was shortened by the last Legislature, complaints were made that the time allowed was so short as to be extremely inimical to the interests of guides and sportsmen. The statistics of the year, however, show that in 1898 more moose were killed than in any one of the five years preceding; and any endeavor to provide a more extended season is likely to be discouraged by these figures. There is good reason for apprehension that the Maine railroads are overdoing the game killing, and promoting an injudicious drain on the native resources of Maine forests. Certain it is that vast moose districts are being cleaned up; the permanent camp has been established in more than one district, where the result is that the game may no longer be found.

This promises to be an active season in game legislation. In numerous States the laws will be practically new throughout if the plans of projected changes shall go through. It is probable too that there will be less of freakishness and more of mature common sense protection than is usual.

The naturalist Ramon Lista years ago described a strange animal he had found in the interior of Santa Cruz as a form of the sloths or ant-eaters. But in proof of the creature's existence Lista never had anything tangible to show; for though he reported that he had pursued it frequently and had shot at it, he never succeeded in securing a specimen; and by many who read his accounts it was believed that the strange Santa Cruz creature was a myth. The receipt of a specimen from South Patagonia by an Italian naturalist has vindicated the truth of the statements made by Lista, and established the existence of an animal whose characteristics are such as to commend it to those who, like Dr. Blaisdell, of Macomb, Ill., are intent upon stocking this continent with desirable game animals from abroad. The *Neomylodon listai*, as it has been named in honor of Lista, is of the ant-eater family. It is a red furred animal, and has under its hair an armor of bony plates imbedded in the skin "like paving stones," slightly less than an inch in thickness and so tough as only to be broken in with an axe. Moreover, it travels only at night. Thus by its integument and its nocturnal habits the creature would prove admirably adapted to take care of itself with or without the protection of a close season.

A few weeks ago we printed a note from New Brunswick on the horns of a caribou, in which the plow measured thirteen inches at its widest part. This, it was intimated, was a record measurement for this time of the antler in the caribou. It is interesting to learn that the head of the great bull caribou killed in British Columbia by Mr. H. G. Dulog, and figured in FOREST AND STREAM of December 24th, was still more remarkable; the plow measuring sixteen inches, and thus being the largest of which we have as yet any knowledge.

"Fancy trapped quail" are quoted on the "seasonable marketing" lists of New York dealers at \$3 per dozen. Where do they come from? From what district may trapped quail lawfully be had?

The Sportsman Tourist.

A Few Days in the Adirondacks.

My mind had been fixed for months upon the anticipated pleasure of a trip to Vermont after deer. A friend of mine started a week in advance for Bethel. First came a letter saying that he had doubts of success, another saying that deer was scarce, and with advice to give up the trip. "Hope deferred maketh the heart sick." Only a lover of the woods and gun can feel as downcast as I did upon receiving this information. After sitting up late nights to select appliances and to pack up after arranging business matters and procuring the wherewith to meet expenses, I was in a sad state of mind.

Not to be balked, I started alone for the Empire State Express: Changed cars at Utica for Fulton Chain; changed again for Old Forge. The lakes were drawn low to allow for repairs on the dam at Old Forge, hence the trips of the steamers were erratic. It was best to employ a boatman to reach Hess' Camp, at the upper end of Fourth Lake. We started off for the twelve-mile pull. Clouds began to gather and an October gale with rain came on with the darkness. The guide was a lusty fellow, and worked nobly, but as we passed out of Third Lake into Fourth Lake he admitted that we were in for it, and asked me to express my wishes. Not caring to land in a wilderness and sleep out in the rain, I advised going on, and expressed a willingness to take the chances. The chances were terrible. North River was never rougher as I have seen it. Some sportsman can recall that peculiar twist of an Adirondack boat while riding the waves. In spite of the utmost care, the crest of the waves was spilled into the boat, and the guns were wet and the baggage afloat. Bailing was difficult. The wind made talking impossible, and things grew rapidly worse. A glimmer of light shone out from the forest and the guide headed the boat for it. The change of course made "confusion worse confounded." We were carried inshore rapidly, tossed up only to come down upon a rock, and off one rock to land upon another. The result was a hole in the bottom of the canoe. A terrific wail from the guide and the light started toward us, its glimmer interrupted by the motion of the man's legs. One more struggle and we beached the boat none too soon. A leap in the dark and a scramble in the brush, and we are safe. I had often heard that the sins of the past flock thick and fast to one's mind when in danger. It is true. I thought of the many country guide boards that I had peppered with shot and of the town hay scales that I had assisted to blow up one Fourth of July; tried to remember whether I had ever fished Sunday or not, and recalled the day that I carried a huge Remington navy revolver to Sunday school. Once on land I forgot it all. It was another case of "When the devil was sick," etc. The danger over, I juggled successfully with a first aid package, lit an old black pipe and called the guide a chump. This guide's name was Bob Dalton, and the man on shore states that Dalton shouted repeatedly to me to save him. In the West the Dalton boys used to hold up others; in the East they seem to want to be held up.

Our friend on the shore wanted to know what the trouble was. We told him that we had started for Fourth Lake, and had brought up off Hatteras. He said: "This is Dr. Miller's camp, and possibly he may assist you if you are injured." I thanked him for the suggestion and told him that we were looking for a minister while on the lake; now that we were on the land and safe, a doctor might be preferable. There is a Lake Placid in the Adirondacks, but we were not in it. Dr. Miller proved to be a very courteous gentleman. He shared his supper with us and allowed us to rest there over night. The Doctor's health was not good, or as his man put it, "he was enjoying poor health." I alluded to the Biblical admonition, "Physician, heal thyself." His man told me the next morning that he was well healed.

Thanking the Doctor in the morning, we departed, and secured a large flat-bottom boat for the remainder of the trip. We needed it, as the storm was still on. Arriving at Hess' Inn, tired out, wet and hungry, an open fire and breakfast were very acceptable. Fred. Hess was down in Maine after moose, and probably succeeded in securing one or more. A large head of a moose hangs in the office as a test of his prowess.

About noon the sun came out warm, and the remainder of the day was as beautiful as only an October day in the country can be. I strolled away from the hotel for a walk. Skirting Fifth Lake, I came upon the sawmill above. The smell of the new lumber recalled pleasant memories. Sitting down upon a log, drowsiness came over me, and I fancied myself a boy again back in the Berkshire Hills, my old home. There were the paths my father and mother trod; there was the school to which I went; there were the hollyhocks, the sweet brier and the buttonwood tree; there were the lilacs through which the west wind played in summer and the blasts of winter raged. Down across the meadows, past the cemetery, over the brook and railroad track, was the sawmill of the town.

Aroused from the dream by the impertinence of a chipmunk, I wandered along to the dam at Seventh Lake, where I could intercept a guide, who had been recommended to me, on his return from the woods. Thinking over the situation, I recalled the books of the Rev. W. H. Murray. The source of his inspiration was apparent. His inspiration and vivid imagination as expressed in his book has fired many with an ambition for a trip to the North Woods. I am inclined to believe that he was more instrumental in building the Adirondack Railroad than Dr. Webb. I could never comprehend his ghost story nor the canoe ride over the falls. I have always felt that it would be great luck to get near a deer under any circumstances; that a man could get close enough to grab a buck's tail and be yanked about is a little ridiculous. Shooting a loon, as described by him, is all right. I have tried it. "Jollied you" as an expression may not have been in vogue when Mr. Murray wrote the book, but that is what he has done with his readers.

A noise in the brush across the brook attracted my attention, and soon a pack horse loaded with a deer comes into sight. I had inquired at the hotel for a guide named Archie Delmarsh, who had been highly recommended to me. I readily surmised that one of the parties following the pack horse was Delmarsh. I watched him as he

forded the stream, noted the ease with which he climbed the bank, loaded as he was with pack basket and rifles. It was easy to distinguish the guide from the guided. As he approached me I said: "I presume that you are Mr. Delmarsh." "I am," he said. I introduced myself, stated my desires, and the bargain was soon concluded. This guide, Delmarsh, is a fine fellow. An honest eye, pleasant smile, broad shoulders, clean cut from head to foot, he stands before you a young Hercules. A continued acquaintance with him vindicated first impressions. He proved to be a good cook, skillful hunter and a genial companion; his speech is free from ribald jests; and the stereotyped jokes of the camp were noticeably absent.

Well, we collected the necessary articles for food the next morning and started off for the seven-mile tramp through the virgin forest, described by the Irishman as "The forest where the hand of man never put foot." Hardly correct as to this forest, inasmuch as we found where the hand of man had put an axe. On a blazed hemlock five miles or so from the start I saw these words written in pencil:

"Beecher's head wants fixing. It is nearer ten miles from Hess."

Above, in a holder hand, is the word "Liar." Do I quote correctly, Col. Beecher? Adj.-Gen. Tillinghast has read the inscription, so has Raymond S. Spears, correspondent of FOREST AND STREAM, and there are others. They all understand what prompted the writing. It is a recorded wail from tired nature. They tell you that it is six miles to Beecher's old camp. It might seem so on a level road, but over logs and stones, up hill and down dale, through brush and swamp, muck and mire, brooks and brambles, with your boots full of perspiration and the skin off in many places, with your pack straps galling and your gun weighing a ton, you, as a tenderfoot, will say it is twenty miles. Some will ask you why you go and endure such hardships. I go that I may enjoy the hardships. Contrasts are beneficial. I drink ditch water that I may better appreciate Apollinaris; eat bacon that I may enjoy a tenderloin steak; sleep on the ground with the clouds for a roof that I may think better of my bed and home. I wear old corduroy breeches, flannel shirt, heavy boots and leather cap that I may enjoy the delights of creased trousers, white shirt, patent leathers and the Dunlap Derby, in a happy combination with the other requisites of a well-groomed man. There are sportsmen who enjoy the stillness of the woods and the chatter of the birds and squirrels. They enjoy the jingle of the running brook, the twilight, midnight, dawn, sunlight and rain. Some are satisfied to return with empty game bags, and happy in the thought that they have not taken the life of any of God's creatures. There the business man forgets his troubles—bank balances, bills payable, competition and borrowers are forgotten. Everything goes and something new comes. But enough of this pathos. Jog along, boys, to our open camp; it is only a little way further; only another mountain to climb, only another swamp to struggle through, part way up a hill, through a balsam thicket, and we are at the place they talk about. We are actually let in on the ground floor and without any detracting contingencies in the basement. Dropping the rifle and shotgun, off comes the pack basket, and "yours for thirst" bolts for the spring with a tin pail. In the greed to quench thirst, more of the cold spring water goes down the outside than to the inside. The old corn-cob pipe never tasted so good.

This little clearing is a beauty spot and I like it. In "As You Like It" Shakespeare says:

"And this our life, exempt from public haunt,
Finds tongues in trees, books in the running brooks,
Sermons in stones, and good in everything."

There are live coals under the back log. The fire has kept twenty-four hours, Delmarsh having left the noon before. The landlord asks me what I will have to eat. I answer that I will eat anything, eat it quick and a lot of it. I will eat pie with a knife, soup from any part of the spoon, and I won't use a napkin or finger bowl. Etiquette at the table be jiggered for once. We haven't a table, only a slab on sticks. The coffee-pot is on, and say, just look at it. It won't take the shine from anything. The pot can call the kettle black and the kettle reply in kind. They can scrap and make up and be no brighter for it. They mean well and are all right inside. Coffee is boiling, bacon is frying, potatoes are soaking, onions are peeling, and my eyes are weeping. "All is well that ends well." Coffee, bacon, potatoes, etc., are disposed of. Delmarsh asks me to eat more and offers to make an Adirondack shortcake, i. e., three toin. flap-jacks with butter and maple syrup between. I tell him that I can eat no more without undressing, and he tells me that he had rather see me go hungry than see me go naked. We wash the dishes with a rag on a stick and hang them up for the sun to dry.

Now for a still-hunt for deer before night comes on. This still-hunting is serious business. Stillness and 210lbs. of clumsy humanity do not blend harmoniously in my case. The leaves are dry and I can crush all the twigs that want to be broken, and kick every stone in sight. The guide tells me I carry the gun all right, but that I must be more quiet. I remind him of my extreme deafness and tell him that he hears more than I do, but that I hear enough.

He led me away off two miles or more from camp; we came to a rock as large as a trolley car. He told me to stand up there and look out; told me to keep my mouth shut and to breathe through my nose after dark, as the night air was bad for gregarious people. I mounted the rock and posed as Ajax Defying the Lightning, or as a plate of ice cream upon a sideboard.

He left me and said that he would call later. Inasmuch as there seemed to be no deer passing, I wondered what had passed in the past. Possibly Leather Stocking and Uncas had built their camp-fire and rested under the port quarter of this rock while on their way from Otsego to the Horicon. Maybe Leather Stocking, alias Natty Bumppo, told the untutored savage the tale of Elijah and the bald head and bad boys. Maybe Lydia Pinkham had waltzed past three or four generations ago clad in a bicycle suit and with her pockets full of artichokes, wild onions and tansy. It had grown dark before the guide returned. He came upon me suddenly and with no warning. I advised him that he was careless, that he might be considered as a deer and get his solar-plexus disorganized by a bullet. He told me that he had con-

sidered that before leaving camp, and had prudently removed the cartridges from my rifle. I lifted my hat to this philosopher and allowed him to lead me by the hand back to camp. We passed near the place the next day and inadvertently found a spot where the dead grass had been matted down by some reclining form. By a kind of Sherlock-Holmes deduction, I was satisfied that Delmarsh had slept quietly through my four hours of watchfulness on the previous day. These Adirondack guides are slick and earn their money by head work.

We had to eat supper, we had to smoke, we must sleep, but before attempting the same I watched for the fairies and fantasies read about as seen by others in the embers of the camp-fire: I got nothing but heat and beechwood smoke for the trouble. The focus was wrong. Tired nature's sweet restorer, balmy sleep, held first mortgage and foreclosed. My last thoughts were for the absent night gown with the words, "Sweet lilies close their leaves at night" embroidered down the back. Morpheus was in command until 3 o'clock A. M., when he was ousted by Mephiti Mephitica with the usual accompaniment. The aroma was all pervading. I swatted Delmarsh with a gun cover and yelled, "Get up, landlord; the plumbing is bad and the house is full of sewer gas."

"Oh, go to sleep; that's a skunk, and I will shoot him," he passed back.

"Don't do it, Archie," I replied, "do as Rowland Robinson's Irishman did, 'Leave him alone and he'll stink himself to death.'"

A hunter can go out with a fixed purpose of shooting deer, and with no thought of feathers, but let a skunk that is careless with his priming cross his path, and you can be assured that he will "consider the 'fouls' of the air."

Tuesday and Wednesday passed and we were still hunting. Up in the morning before light, out in the afternoon till after dark, and no deer in the camp. I had a splendid chance at a fawn, but some way I could not kill the little chap. It was not buck fever; it was far pleasanter to watch him. Of all the pleasures of the trip, the sight of that graceful creature is the clearest in my memory. My little friend skipped over the ridge, and I wished that he might live forever. I gathered in four partridges with my Daly shotgun. Birds wait for an introduction before departure in that section, and the only sport obtainable is to shy a stick at them to start the wings in action before shooting. Broiled partridges, flapjacks, coffee and cigars for supper, the Café Savarin is a nonentity in comparison to such a meal in such a place.

Friday came around in regular order. "This is the day that tries men's souls." With thirteen cartridges in my pocket just for luck, I started out in the rain. The leaves were damp under foot, and there was sufficient wind to cover any sound caused by passing through the undergrowth. Delmarsh waited around the camp until I had been gone thirty minutes or more. He then started off to the right for a valley between the mountains. I had reached the opening of the valley down in the plains and paused for a moment to locate the ford of the stream that pelts down through the valley and empties into the river. Oh, my eyes! Across the river, and jumping as only a startled deer can jump, was the largest buck ever seen in the Fulton Chain regions. My .38-55 handled itself grandly, and it called for lively work on the part of its owner to keep up with it. The first shot smote the hindquarters—all that was in sight at that moment. The second shot spat into the brush where the poor fellow had gone down. The second blow evidently stung sharply, for the head and foreshoulders appeared on the other side, while the haunches were down. Although the distance was considerable, I could discern that the stricken beast was looking for his tormentor. A feeling of sorrow for his suffering came over me, and it seemed merciful to send the third message through the heart. Just how I reached the fallen I don't know. Most of the way by water, I think, for I was soaked head, hams and heels. There was no feeling of exultation—rather a sense of guilt. To see such eyes grow dim, to see the changing colors and the final shriveling, is not glory. Lay the blame to your ancestors, to the atavism in your make-up, and hope for the day when man will not kill. As an offset for my conduct, I mused that inasmuch as the allotted life of a deer was about twelve years, I had not deprived him of all; possibly he would have died of old age and suffered much toward the last; possibly he would have been stricken by one of his own sex and kind, a younger and more vigorous creature, in a struggle for supremacy.

The weight at Fourth Lake after the dressing was 225lbs. Allowing less than the usual one-third for shrinkage, it is safe to presume that the weight in life was 310lbs. If any one can tell of a heavier deer than this there is a modern Ananias somewhere. Raymond S. Spears told of this one in yours of November 13, 1897.

Archie had heard the three shots and came down to see what the trouble was. Upon seeing the deer he said, "If I had known that you could shoot I would not have untied that buck. I have kept him for the last five years in order to allow my guests to see one upon the last day." Othello's occupation's gone.

Wellington Kenwell lived seven miles further on. We met him on the trail with two pack horses. This was luck. I could ride old Doctor and the deer could be packed upon the other horse. A hot fire and a partial change into dry clothing, and "Richard was himself again." The last meal was cooked and eaten. I had mounted the old Doctor; Delmarsh passed up the pack-basket loaded with pots, kettles and pans. On top he placed a bag of buckwheat flour that he wished to save. We bade good-bye to the old camp and promised to come again.

This old horse, Doctor, is a famous beast about thirty-seven years old. A big bay at one time, but now grizzled with age. He has carried many burdens and been faithful through all. His end is near, possibly at this writing he has passed over the great divide. If there be a heaven for horses, may he reach it and there, with Bucephalus, Pegasus and Balaam's trotter, with the other steeds of antiquity, together with Dexter, Flora Temple and others of modern times, may he cavort in green pastures and feed upon celestial oats. May the only cinch known to him be that of ready access to the heavenly grain-cribs. Two miles from camp he erred sadly and caused me much discomfiture. I forgave him,

It was caused by a dimness of sight and the stiffness of old age. We were crossing a swamp where the mud is bottomless. The path was rudely corduroyed. The Doctor let one of his stern anchors down between the timbers and the old craft began to settle. With a tremendous effort to retrieve, and by a reflex motion, I was bucked high in the air. I clutched at the tree tops, looked longingly at the clouds, and came down with the proverbial dull thud. The pack-basket came down next, then the rifle, then a shower of nuts, tin plates, knives and forks; the buckwheat flour came down last and covered what the mud did not. Oh! "I was right in it (the mud) and out of sight." Kenwell and Delmarsh pulled me out; one picked the mud from my best ear with a match, while the other scraped my bald head with a tin pan. I was a study in black and white and spatter work that would put in the shade the best efforts of Frederick Remington. I alternately spat mud and flour until I wondered whether I was a dump-cart or a grist mill. The Doctor was struggling to get up and slinging mud like a yellow journal editor. I asked Archie why he had saved that buckwheat flour, and he said, "I have not saved it." It angered me to think that any one could joke at such a time. I twirled the coffee-pot at him with a left in-shoot, he ducked and took first on passed balls. I passed the spot this year (on the other side). A badly battered coffee-pot hung on a limb of a scarred tree—hung there not as a harp on a willow, but as a tangible evidence of an ungovernable temper.

Jog along, boys, there's soap and water at the hotel and a complete Baxter street outfit. We reached Fourth Lake safely. I gave old Doctor a good cleaning, saw that he had his peck of oats, kissed his old muzzle, and we laughingly parted as good friends. A bath, supper, bed and night's sleep were never more highly appreciated.

In the morning Delmarsh was on hand and his bill was paid. I gave him an extra counterfeit ten-spot. The chap really seemed to like me and requested me to come in '98. I led him to the valley where the stream from Fifth Lake empties into the Fourth, and assuming an Aguinaldo attitude I whispered thus: "In '98 I'll meet you, when the leaves turn, Archie; when the beech nuts are falling I'll meet you; down there where the canoes land I'll meet you; stay for me there; I will not fail to meet thee in that hollow vale." His answer was pathetic. I could only catch two words between his sobs, "rats" and "crazy."

Delmarsh's brother and the deer took one canoe, Delmarsh and myself another, and we started, for Old Forge, intending to catch the afternoon train and procure a berth in the Montreal sleeper at Fulton Chain and reach New York Sunday morning. The lakes were like mirrors; the mountains, trees and cottages were reflected perfectly. If you should stand on your head you could not tell "t'other from which." I proposed a race; the boys agreed. Archie said there was an old buck in each canoe and the chances were even. It looked like his race until I called his attention to a stump ahead. While he was looking over his shoulder I got out a sea-anchor in the way of a rubber boot. The stakes—my pipe and tobacco—and the race went to his brother. The race and the stillness of the water brought us to Old Forge in time for the noon train. By quick work with the express agent I made it. The first newspaper I had recorded the death of that fine American, Charles A. Dana, and I realized that an able man had passed away.

Arrived in New York at 10 P. M. Taking up the Sunday paper the next morning, I read of the disaster on the Hudson River Railroad. A whole train had gone into the river, and with it the Montreal sleeper that I had intended to take. I might have escaped—I might not. If not, I could wait patiently with the others for the clarion notes of the Angel Gabriel's reveille.

In relation to guns, they can dispute as to the merits of the .22, .25, .30, .40, .45, .50. I am willing to force the center with a .38-55 as a flying wedge. A kind of "middle-of-the-road pop," as it were. In relation to whiskey in the camp, I assert that the whiskey drinker is the rear guard on a long tramp; that the partridge is out of his bailiwick before he can raise his gun; that he does not "saw wood and say nothing;" the fire goes out and he talks all the time. Whiskey means locomotor ataxia for his legs, incipient paresis for his brain. Extract of witch-hazel is of far more use. Ring off!

W. W. HASTINGS.

NEW YORK CITY.

House-boating under Difficulties.

HOUSE-BOATING in Maine, up to the present time, has not become a craze of her summer saunterers; but some observers, to see the proprietor of one that recently came under the writer's notice at Isleboro, Me., tied up to an old wharf of one of its many picturesque coves, not knowing of his success at the business, would deem him at least crazy to attempt in his crippled condition such hazardous work as it must be to go from port to port alone. For he is a used-up man, apparently, having been born with a withered leg and arm, and one foot which is twisted and deformed, and a mere apology for that part of the anatomy, and on land he hobbles about in a very laborious manner, and painful to look at.

W. O. Cottle, the subject of this brief chronicle, is a native of Jonesport, Me., and is now a weather-beaten, grizzle-bearded, pleasant-spoken man of fifty-five years of age. Notwithstanding the handicapping nature has saddled him with, he has successfully followed the sea, and at one time was first officer of the good schooner Sea Breeze, of Ellsworth. He has also served as cook on several vessels satisfactorily, and between voyages he has learned the shoemaker's trade. Four years ago, having become too old for nautical life, as he had found it, he says, and somewhat tired of its arduous duties, he concluded to retire from it, and go house-boating.

Obtaining the necessary material, he constructed alone, unaided, from keelson to truck, a scow 20 by 6, with a house on it roof, long, and the width of the craft, and christened her with a bucket of pure Penobscot bay brine The Yankee Notion; and though his first attempt in the line is a very creditable piece of workmanship, and one that is destined to give the house-boat building in Maine

waters a new impetus; for a number who have seen it have already laid their plans to build one.

The house has a door in each end, which, being lashed open, permits him to see through it to steer. She is sloop-rigged with two weatherboards on each side, which enables her to get to windward quite a distance in a day. All of the hoisting tackle leads aft to his seat by the tiller, and can be worked without his moving from his position. In the house in one corner is a yacht stove. In another is a convenient cuddy containing all the articles with which to get up a palatable meal, and with the tiller becketted his craft steers herself in any ordinary wind for hours; thus giving him ample time to prepare his food and discuss it. Another corner contains a bunk in which he sleeps with his faithful little dog Snip, who has been his mate the whole four years.

On one side of the house is a shoemaker's kit, and the business part of his cruising is to go among the islands and to anchor at any port that affords a prospect of work, and to repair boots and shoes; and in most of his ports he has no competition, and he picks up many a dollar.

The picture accompanying this brief chronicle of a man worthy of Clark Russell's pen shows him hauled up in winter quarters at Swan's Island. This place was his home last winter, and it speaks well for the humanity of its inhabitants to know that this unfortunate battler for an existence was attended by them through a severe attack of the grippe, which confined him to his bunk for weeks, and which threatened to end his voyaging, as carefully as if he was a brother, instead of only a visitor.

THE YANKEE NOTION IN WINTER QUARTERS.

He has never met with a mishap worthy of mention except once, though he has been obliged to scud her under bare poles more than once, and run to leeward. This time the staunch Yankee Notion took a notion to maroon him, on one of the uninhabited isles he had run her nose on, while he stepped ashore to get driftwood for fuel. The wind was off shore, and the tide ebbing, and as it happened he had moored her insecurely, and a strong puff of wind was enough to set her off, and when he noticed it she was 20 ft. from the shore. Not wishing to do any cruising in this latitude, he plunged in, and kicking out gamely with his game leg, he swam to her and got aboard before she had gained much headway, and navigated her in, where he cast a bowline and a bight around a spruce tree that held her till he had wooded up.

Captain C. says he has a good chance to demonstrate the value of fish as a brain food, and means to jot down in his log its effects, for he subsists largely on it, and in its freshest, purest state. He can cull a mess of edible fish from his backyard, so to speak, at any hour, and the different localities he visits afford an infinite variety in his menu. For instance, mackerel, cod, haddock, pollock, lobsters, clams, scallops, periwinkles, mussels; to say nothing of the humble flounder, which it is said often masquerades as sole. After satisfying the inner man from some of the succulent specimens named, he leans back on the taffrail with a "fate-cannot-harm-him" air worthy of the philosopher that a conversation with this mariner leads one to think him to be.

Capt. Cottle is not able to go aloft now, but could once, in spite of his disabilities, and pass the weather earing as lively as any mate afloat. Now, when anything gives away in that part some one in port must lend a hand and help him out, otherwise he is independent of any help but that of his own calloused, crippled fingers. He dispenses with his crutches when at sea, and supports himself by convenient lanyards and the sides of his boat.

His example is a good lesson for some to contemplate who, under more favorable conditions than his, would no doubt give up in despair and become charitable charges. He is not acquiring wealth at present very fast, he says, but obtains enough of it to supply all of his wants, and he contents himself with the fact that he is not wasting his substance as fast as the average house-boater we read of must be obliged to do, and that he takes as much solid comfort among the beautiful Penobscot Bay islands as the owner of the most palatial steam yacht that plows her way around them in nickel-plated splendor, and that the boat, tender and sails cost only \$50.80, all told.

Gens des Bois.

Guy Brittell.

SOME men are famous for one thing, some for another. Fitzgerald was the only man who ever reached the summit of Aconcagua, and Guy Brittell is the only man who ever caught an eel in Deadwater Pond, at the headwaters of one of the main sources of the Hudson. In my short acquaintance with Guy, I did not see any noticeable evidences of pride or vain glory aside from the mention of the eel, but when he told of that, the original sin which caused the fall of the Angel of Light from Glory manifested itself. He had done what no other human being before or since has done, and nothing could quench his pride in that achievement.

Guy's claim for recognition fortunately rests on a more substantial basis. He is one of the Gens des Bois or People of the Woods, a man in whom the potent blood of mighty forefather Nimrod has again had life. A man in whom the secret witchery of nature works, and who has periods of woods insanity when he cannot resist the spell of the wilderness. A man, in short, who can never become thoroughly civilized or come in touch with the commonplace level of the rest of gregarious humanity.

Guy is fifty-five years of age, with a capacity for being unobtrusive and also a capacity for commanding attention.

If the conversation is one which does not interest him one does not notice his presence in the room. The

gawky teamster, though he says no more than Guy, shuffles his feet and clears his throat so that you are always conscious of him, but Guy fades into the background much as he does when still-hunting. He has in a way the powers that the fairy stories tell about, of making one's self invisible.

When the subject, however, turns from politics to the difference between coon and hedgehog tracks, let us say—a matter in which he is interested—Guy takes the leading part in the conversation. He is sure to be well informed, and his remarks are shrewdly put and to the point.

Guy is a Jack of all trades. He makes razors from old files, and when he finishes the last process of honing them on his horny hand the razor is guaranteed to be a good job, though perhaps not very fancy with its copper rivet and plain cherry wood handle.

He works in the sawmill at Newcomb just now, but he is a veteran of the Civil War, and for years lived in an isolated locality near the juncture of the north and south branches of the Boquet River, under the shadow of old Dix. He was a squatter there, and eventually the owner of the land turned him off in order that a hotel, where trout suppers and game dinners are the feature, could go up on the site of his modest home.

Trapping with 'Lige Simonds.

Lige Simonds, the man who is said to have killed more bear, deer and foxes than any other hunter living in the Adirondacks, used to visit Brittell, and together they hunted and trapped on the Boquet. One October they killed eleven deer in a few days at the Lower Stillwater, with the help of two cur dogs, one a coach dog and the other part cocker spaniel. These dogs would run a deer a few minutes as if the devil were after it, just long enough to get it badly scared, and then give it up and return to their master. The deer generally put for the river, and there one of the hunters who was in waiting accounted for them.

Sometimes they got four or five deer a day. Simonds had a little log camp built at the side of a big rock, no great distance from the bear wallow. This bear wallow lies in the swamp between Lily Pad Pond and the Boquet, and is a place where the bears resort in hot weather to cool off, wallowing in the black mud like pigs. They have worn out a number of holes here, and one may find fresh sign at almost any time during the summer.

Another natural curiosity in the same general neighborhood is the "laurel bed," where grows a very beautiful flowering laurel. The laurel is almost unknown in the Adirondacks, at least on the eastern side, and the exact location of this bed is not generally known. Guy avers that the leaf is very poisonous, and that cattle are killed by eating it.

From the Lower Stillwater a bear trail runs around the west side of the Twin Ponds, and so on to Noonmark.

Guy and Simonds both had traps set on this trail one summer, but while Simonds secured most of the bears

that investigated his trap, Guy had bad luck, and lost six bears in succession. One got out by a cute trick, which proved that he had a mechanical head and a higher order of intelligence than is generally characteristic of bears. He selected a spot where there was a narrow opening between two poplar trees, which grew about 18 in. apart, and turning the trap up on edge so that one spring on each side rested against the trees, he pulled on the trap. In this way a tension was put on the springs, and the jaws were released and the bear's foot came out easily. That bear seemed to understand the mechanism of the steel trap, and Guy says there isn't a trap in the woods that will hold him now.

The last bear to get away pulled Guy's trap all out of shape, so that it was only fit for the junk pile. The clog happened to become very securely caught among some rocks. Ahead, and just within reach of the bear, was a stout young birch tree. The bear clasped this, and like Sampson of old, pulling on the pillars of the temple, exerted a mighty heave, bending the heavy jaw of the trap, and releasing its foot.

A Much Caught Bear.

This bear, as far as intelligence went, was a contrast to the little one with the mechanical turn that Guy first told about. Before it had gone half a mile it stumbled into one of Simonds' traps, and this time it was caught for good and all, as Simonds came up and shot it.

It was one of those creatures who learn nothing by experience. Each one of its four legs had been in traps, the fact being attested by three broken feet and one missing, self amputated, no doubt, at the trap. One foot had been uninjured till caught in Guy's trap, but the foot in Simonds' showed old scars, indicating that the bear had been caught at least five times.

How Guy Sets Bear Traps.

Bear trails in places are well defined paths, and in the running season, which is at its height in June (?), the bears blaze it by biting trees, each leaving his mark as high up as he can reach. In passing over these trails the bears step in each other's footprints, and if one bear fifty years ago crossed a log at a certain spot, every bear that followed is morally certain to have chosen the same place. Moreover, they never deviate from the exact line of their trail if it is in any way possible to avoid leaving it. Knowing these facts, Guy never baits his traps. In setting them he has two considerations to keep in mind—first, placing the trap where a man will not set his foot in it, and second, where a bear will.

On the Twin Pond runway he found a spot where a small spruce tree had grown up directly in the bear's path. A man would step to one side to pass this if he happened to be following the bear's route, but the bears themselves on account of their conservatism preferred to go under the low reaching boughs. An old mouldering log lay here, and where the bears stepped in crossing it Guy chopped out a hole in the mossy sod large enough to receive his trap. He buried it carefully and smoothed a spot in the center over the pan for the bear to set his foot. The chain was fastened to a birch log 8 ft. long and 4 in. in diameter. The ring was slipped over this and secured 2 or 3 ft. from one end by driving spikes both sides of the ring.

A Jumping Hare.

I once heard a lady mention the fact that in Colorado they have jack rabbits 17 ft. long. She knew it, for her son had told her so. What she meant was that the rabbits jumped 17 ft. Guy says they don't have any such rabbits in the fauna of the Adirondacks, but he has seen one that jumped 10 ft. straight into the air. He had set some twitch-up snares on one occasion, and a rabbit that a dog was chasing happened to get into one. The dog tried to catch the rabbit, but every time he made a dive for it the rabbit jumped, and with the spring of the elastic sapling to which the snare was attached shot up in the air to a surprising height. It kept the dog guessing, for he had never seen a rabbit come so near flying.

Hunter's Luck.

Once Guy hunted all day with his boy without seeing a fresh deer track.

Toward nightfall they stopped at a brook to drink, and while the boy was stooping over Guy looked down the mountain side through the hardwood timber, and saw a deer standing feeding in the top of a fallen tree. Guy caught the boy's eye, and motioning to him to be quiet, raised his rifle and fired. The deer sprang square into the treetop, and disappeared from view. The next instant out it came, apparently from the opposite side, and bounded up the mountain.

After running a few rods it stopped. Guy felt sure that he had hit the deer, and hardly thought it necessary to shoot again, but the boy threw up his gun and fired and down it came. They went over to where it had fallen, and to his surprise Guy found that the deer had only been hit by one bullet. He couldn't understand how he had missed, but would never have thought of the real explanation if he had not heard a deer "blat" below them. This directed his attention to the treetop, where the deer had first been seen, and going over to it, he found a deer with a broken back. There had been two deer feeding at the treetop, and the instant the first was shot the second sprang from the opposite side of the tree so quickly that no eye could have distinguished between them. Both were yearlings and similar in every respect.

A Calathumpian Drive.

Guy is bothered a good deal by rheumatism contracted in war times. He left Newcomb and came over to North Hudson to get a little rest, which naturally meant hunting and trapping. After he left Newcomb he says some original genius organized a calathumpian deer drive. A large number of men and boys arrived with tin pans, horns, circular saws and other contrivances for making a hideous noise, marched across one of the best deer grounds in the neighborhood, and drove the deer toward stands where other hunters lay in wait to kill them. A few deer were killed, and the rest so effectually frightened that they left the country, and haven't yet returned.

J. B. BURNHAM.

The Two Flags.

O'er the Western world, in its pride unfurled,
Long floated the flag of Spain;
And the tropic seas, where it caught the breeze,
Bore the name of "the Spanish Main."

On its ample fold of "blood and gold"
Were blazoned both means and prize,
For the stripes of red marked the blood they shed
For the gold which had filled their eyes.

Lands he did not own, from his priestly throne
The Pope unto Spain had given;
And the Spaniard thought that the crime he wrought
Was a passport sure to heaven.

Though they crossed the seas in the name of Peace,
They went with the sword in hand;
And the cross they bore was steeped in gore
When they entered a foreign land.

In the field and mine, by their right divine,
The Indians were forced to slave,
At proud Spain's behest, till their only rest
Was the rest of a bloody grave!

With the march of time comes the end of crime;
And the banner of gold and gore
From the peaceful smiles of those tropic isles
Has fallen to rise no more!

For the early dawn of the new year's morn
Sees another banner rise,
Which blends the hue of celestial blue
With the rose of the morning skies!

Its bands of white speak of truth and right,
For which that banner stands;
While the stripes of red mark the blood they shed
Who fell for their native land!

And above the bars they have placed the stars
In their field of heavenly blue,
As the beacon light in time's darkest night
Of the flag of the free and true!

Long may it wave o'er a nation brave,
And be freedom's symbol fair;
That the banner of Spain shall ne'er again
Claim rule o'er the Western air!

VON W.

In Southeastern Texas.

PERMENUS BRISCOE lived in Houston, Texas. Good, easy, quiet bachelor, he possessed faculty for hard work, physical and mental, from about daylight on Monday morning until his own mill whistle sounded at noon on Saturday. Then came an irresistible longing to get away out of town in season to get a bit of shooting of one sort or another, to have a cast at bass, or possibly only to lounge and snooze, and browse and nibble buds and culms of sedge.

Briscoe's father had been one of the earliest settlers around Houston; he was indeed one of the immortal Texas men, who in '36, under heroic Old Sam, on the field of San Jacinto, had overthrown the self-styled "Napoleon of the West" and given life to Texan independence. The veteran was of prodigious stature, standing 6 ft. 6½ in. in his moccasins, weighing 245 lbs., and withal as powerful and agile a man as had ever been on that frontier. Calm dignity of manner, reputation for great courage, together with proverbial reticence, gained for him extraordinary prestige with the Indian tribes who in those days frequented as hunters in a half-friendly way the semi-wooded precincts of Buffalo Bayou and the San Jacinto River. Owing to a habit of the old frontiersman of producing a prodigious noise when he sneezed—some such blended racket as might accompany the simultaneous blast of a fog horn and the explosion of a submarine torpedo—he came to be called, among his Indian acquaintances, Big Sneeze.

Savage minds, with quick perception and appreciations of natural phenomena, attribute to men who go off in a loud hiccoughy way when their nose membranes tickle, honest, open natures, alive to keen enjoyment of pleasurable sensations. With them, on the contrary, a sure indication of a mean spirit is the effort to strangle a sneeze.

It was amid such wild associations in the later '40s that my Briscoe, as a lad, acquired taste for camp loitering along the timber fringes of the bayous. He had long ago scouted and trailed along with half-nude, dusky young hunters where Houston town had since come to be. Where game could be found, and how best be taken, was exact knowledge, as assiduously sought and improved by Briscoe as were facts relating to his well-conducted business of saw milling and dealing in lumber.

Just when I first knew of this man I scarcely recall. In 1877 my shingle—mine among scores of those of other young lawyers—swung hungrily in the prairie breeze of the Lone Star State. Prostrate behind a pawn-begged book-case in my office in the Bayou City lay an old camp-worn gun case, and beside it a disused dog whip. Dust was thick upon the one, which mice and roaches had knawed and nibbled the greasy plait of the other. Yet lovingly, aye, most tenderly, would my truant mind sometimes loaf behind that shelving, and toy pleasantly with those old companions, while my professional eyes lolled listlessly over annotated pages on my town-tired knees; for I too had known the chase, and had ranged the forest and fallow lands of the old plantation in Piedmont, Fla., the beautiful hill region of the Tallahassee country, where dogs, guns, game, camp-fires and such belongings were, and still are, thank fortune, very much in evidence. The nature of a man who has once acquired a taste for such diversion becomes "powerfully sot," as the negroes say. His soul remains forever in sympathy with the spirit of the thing.

I remember, however, finding Briscoe one afternoon in my office engaged in some matter of business with my partner, after the conclusion of which his sportsman's eye, wandering around—for such men are ever close observers—fell upon the familiar outlines of a gun case.

"What sort of an iron have you there, St. Clair?" inquired he, addressing my partner, Mr. St. Clair Talliaferro.

"I can't say," replied that worthy; "I'm not shooter; know nothing of guns, large or small; but, believe me, if there be such a distinction in gun iron as sex, then I believe that particular one to be a she-thing, notwithstanding its reticence, because now and again I come in and find my partner, Call there, patting and admiring it with a manner which I can only understand a man bestowing on a woman."

We laughed at Talliaferro's joke. Seeing that Briscoe wished to inspect the piece, I arose to secure it for him, saying "That's an old gun of mine, Mr. Briscoe; nothing handsome, but an uncommonly good one, I think; one of Parker's early make, a 12-gauge, with the old push-up-under action in front of guard. It is a close, hard hitter, and has for a long time done excellent service in covert and on the marshes."

"Do you shoot, Mr. Call?" he eagerly inquired.

"Do I shoot? Man alive!" I exclaimed. "The only thing I've seen in a twelve-month that suggested a shot was that tin chicken down street on a stable vane. I have been a shooter, fonder of it, indeed, than any other occupation. I have no opportunity nowadays for pleasures of that kind." I handed him the old gun, which I had "put together." Sometimes I feel tempted to seize that old fusil and get out of this town for a tramp at least or go mad."

Briscoe looked the old gun critically over, unbreached it, inspected the inner surface of the barrels, tried the action of the locks, passed his hand discriminatingly over the stock, standing, fetched the piece to face and shoulder several times to test its balance, and said slowly, "It has seen service, but you keep it in excellent order."

"I never touch it," I replied. "It has lain there these two years."

Fetching it again to his shoulder with an easy, graceful swing, and a quick glance along its rib at my silk hat hanging on its peg, the Texan asked, "What do you know of its shooting buckshot?"

"Very much," I answered. "That is one of its special accomplishments. In Florida, in my own and other hands, it has gained somewhat of a reputation for putting buckshot hard, close together and well away."

My listener, with thoughtful manner, began laying the piece away in its old case carefully, tenderly. After a little hesitation, he said, "I'd like to shoot that gun. I'm in the habit of getting out around about here occasionally, and sometimes have fair sport. I'll be glad to have you join me if you will, when you choose."

"Thank you; I shall be pleased to do so whenever you will allow me. In the meantime, Mr. Briscoe, I beg that you will consider that gun at your service. I suspect you of being appreciative of gun excellencies, and have confidence in that old piece possessing qualities likely to satisfy a fastidious man."

This was the beginning of my acquaintance with one of the plainest, truest men, and most delightful field companions I have ever known—one memory of whose genial, manly nature has pleasantly solaced me in late years, and will linger kindly with me forever.

Squirrel Fat on Sim's Bayou.

On a Saturday in September, 1877, in the District Court of Harris county, Tex., I was engaged in the trial of a civil suit, in which my thrifty client sought to avoid payment of rent for premises where he did a retail dry goods and clothing business, because of having suffered, at the hands of his landlord, an eviction from part of the demise by the nailing up of a door to an outhouse which had been used and enjoyed by tenant since going into possession. My client's contention was that, having been evicted from a part of his demise by the willful and wrongful act of his landlord, payment of rent for the whole was suspended for the term.

The weather was insufferably hot, the atmosphere close and stuffy, the court-room crowded with an especially sour, bad smelling lot of spectators. The trial had continued for a day and a half, and the exhausted jury had just rendered one of those inexplicable compromise verdicts intended to favor both plaintiff and defendant—one of those verdicts that make lawyers tired—from which you scarcely dare appeal, and yet sickened to have to abide by. I was heated, jaded, disappointed, a disgusted sense of the greasy, sordid people, whose mean, dirty business I had to consider seized me and filled me with an absolute loathing for a life that put me in contact with such conditions. Inexpressibly sick and tired of the whole business, I turned dejectedly away.

I staggered out of the smoke and tobacco scented hallway, down the stone steps into the dusty street, among a hustling, perspiring throng of human dollar hunters, every nerve in me tingling with a discordant sense of unfitness. At the first crossing I came upon Briscoe.

"Ah, here you are," he cried. "I was on my way to find you. Are you busy this afternoon?"

"No longer so."

"Then what will prevent our getting out of town a little way and spending a couple of nights in camp? Get your dinner and I'll call for you in my wagon at 3 sharp." And he sauntered away.

"The very thing," I thought, and a sense of delightful anticipation took possession of me. Hurrying to the office, I got rid of some law books I carried, gave my partner, Talliaferro, a galloping account of the knock-kneed verdict rendered and rushed off, gun case in hand, to absorb a bit of nourishment and get ready for Briscoe's coming. Somewhat later, by that good angel's side, in his light hunting trap, I drove out into the prairie.

There is a buoyant, free-roving sense attending a drive over a prairie, inexpressibly invigorating and somewhat analogous to sailing, but with greater confidence of safety to lubbers.

Briscoe proved to be a thoroughly pleasant fellow during our drive, not a gabby chap; scarcely a man of conventional cultivation at all, but clever, full of well-digested observation of men and things he had come in contact with, a patient, discriminating listener, searching in his inquiries and making observations in simple, forceful speech. To my yarns, volubly spun for his edification, he listened with an extremely quizzical expression of countenance, chuckled softly at my jokes, and left you with a sort of semi-consciousness of having talked a little too much.

About sundown, perhaps ten miles away from town, we entered a region of fairly grown post-oak and short-leaved pine timber, and presently reached the edge of a sluggish, muddy little drain-way, the turbid waters of which stood rather in a succession of puddles than in any continuous stream. Here were seen in the soft mud of the puddle margins numerous footprints of raccoons, herons and cranes which had been in search of tadpoles and frogs, and among the broad tracks of cattle were discernible those of deer in considerable numbers.

Determining it a likely locality in which to find antlered game, my companion proposed that we stop here, having wood and water, and that we fire-hunt the range that night and push on next day in the sunlight to Sim's Bayou, the point we had started out to reach, and hunt that cover the next night. This arrangement was determined upon, and while my companion got the ponies out of their gear and fed and watered them, I kindled a fire, made a pot of coffee, and spread out upon an un-cushioned wagon seat, placed on the ground, some of the contents of our well-filled lunch basket. After the meal Briscoe suggested that he would saddle the horses, while I refilled and trimmed the lamp, preparatory to riding out in search of deer.

The truth was, that fire-hunting, or the effort to shoot deer at night by shining or reflecting their eyes with a light carried for the purpose, was a method of taking such game with which I had very slight familiarity, and was not at all in conceit of. In Florida, where my hunting experiences had been evolved, that particular caper was scarcely the thing, but, on the contrary, was held by real sportsmen considerably in contempt, as smacking of a potting purpose really too greasy for a sportsman's toleration. Among "meat-hunting" country folk there such practice was sometimes indulged in, but in a very clumsy fashion, by two men afoot, one going ahead with a gun, looking out for shining eyes reflecting the light of blazing pine knots, the knots being carried in a long-handled pan over the shoulder of the other man, who walks behind. Two such demons go stalking through the woods, casting silver light and dancing shadows far ahead of them, that every kind of intelligent creature might see them afar off and clear out. Occasionally the hunters come upon a feeble-minded, unsuspicious creature, now and then a deer, oftener some domesticated animal, and while it stands innocently staring the hunters march up and blow out its brains. I had once or twice, in earlier life, gone "fire-hunting" after the manner that obtained in Florida. I had never succeeded in killing anything but my pointer dog, which, poor creature, incautiously looked back at me as he ran unobserved ahead.

I had said nothing when Briscoe first mentioned "fire-hunting" as a favorite scheme of his, but had kept up a thinking. What a fine, large, open, extensive sort of recreation it must be, thought I, wandering about afoot at night on a nice broad prairie looking for deer with a lamp. Then I remembered that when a boy I had been induced to accompany another chap at night with a torch, at low tide, in the Gulf of Mexico, in pursuit of flounders on a mud flat, and that besides actually jabbing a sting-ray I had scalded my hand with dripping pitch from the torch, cut my foot badly on an oyster-shell, skinned my hands with barnacles and had "lots more fun." My experiences clearly were that you can't sometimes tell just how a thing will turn out until you've tried it. So when this contriving Texan said he would saddle the horses while I fixed the lamp, and we would ride after deer, I began to take a little heart, and thought so much better of the project. We were going into the wild, delirious sort of thing mounted, at any rate.

Knocking the ashes out of my old Powhatan, I rose and sauntered leisurely toward the wagon. On the outside of the body of the vehicle was attached a capacious covered box, or locker, for axle-grease, wrench and other paraphernalia of camping. Out of it I had already fetched a coffee pot, tin cups, etc., and as I now approached it I endeavored to recall having seen any article in it that suggested a lamp, but I could not, so into it again I began to rummage, whistling the while in as nonchalant manner as I could assume. I had never seen a Texas "head lamp" that I was aware of. Failing, among the mass of discovered contents, to find anything at all resembling any conceptions I had of a lamp of any kind, I finally fastened on to the only thing I saw I did not know the name or use of. I entertained a sort of general impression that upon closer inspection, in a better light, the nondescript I had captured might turn out to be a dilapidated coal scuttle, an abandoned grocer's scoop, or possibly only a bit of battered guttering; but I didn't intend to play "greeny," and so whistled away desperately as I approached the fire, swinging the tin contraption as a careless girl might her sunbonnet.

"Now, trim her up nice," said my hunter friend. At a glance I saw he was regarding the machine in my hand. Then I knew I had the lamp. To picture a Texas "fire lamp," fancy one of those little French carriages, yclept a cabriolet, made entirely of tin, the wheels removed, the shafts put on the back side, and you have at least an outline idea of it. It holds a pint or more of oil, sits on the hat brim in front, backed by a shield or tin shade, resembling one of those to footlights on a dramatic stage, made fast by bending the tin "shafts" or strips around the hat crown and tying behind with string. Jack-lamps, flash-lamps, bullseyes, "can't hold a candle" to a Texas fire lamp.

I filled the oil receptacle from the can of mixed lard and kerosene oil, carefully sat the oil can away from the fire near the root of a big tree, and announced in a loud voice that things were "all right."

In the meantime Briscoe, having saddled the horses, had taken the old gun out of its case, put it carefully together and stood, back to fire, fetching it smartly to shoulder and catching quick aim at numbers of imaginary eyes peering at him from the shadows.

"She certainly comes up nice," he muttered. "Well, let's ride. You take the mare. She is steady under the gun. Here, hold your head still, while I fasten the lamp on."

"No; no!" I exclaimed. "You do the shooting. I want you to shoot that gun, you know."

"Yes; but you don't know these woods; you can't steer, follow the feeding grounds, and come back to camp," he suggested. It was too apparent to admit of argument; so on to the mare I sprang, lamp atop, the old

gun across my lap; and heading along the trend of the drain, away we rode.

After a short stretch Briscoe said: "I don't like the way old Jim behaves."

"What's the matter with him?"

"He pears to worry and keeps a-scenting the wind, like it might have wolf in it."

"Wolves! there's no danger of wolves about here, I hope."

"No danger from them, I reckon, but mighty apt to be wolves, and if so, our chance of getting deer is bad."

I soon found the effect of the method of hunting we were engaged in exciting and interesting in the extreme, and was instantly a convert to the fascination of mounted hunting with a Texas fire lamp.

In front, and for an angle of 30 degrees on either side, was thrown a bright, steady light 50 ft. away, within the radii of which objects could be distinctly discerned. Beyond hung impenetrable darkness. My person, the horse under me, the mounted companion and everything else behind could not be discovered by eyes looking toward us from the front. I then readily conjectured what I subsequently verified, that even a man, looking at such an approaching light, has no suggestion offered him of anything else; he sees only an air-tossed flame, the real nature of which, or its distance away, cannot be most vaguely guessed at—a very will-o'-the-wisp, startling, curious, murderous to staring creatures along its route.

It was while reflections of that kind were passing through my mind, yet with all my hunter's instinct on the alert, that out of the depths, beyond the range of bright light, I saw two yellow balls—a mere flash. Then they were gone. Instantly there they were again—and two more. Certainly those were eyes—live things—and looking at me. The mare checked her own headway, my gun came up involuntarily, and in an instant the sharp, snappy report awoke the echoes of the dark woods. There followed a furious yelping, howling, growling, and the mare, as steady as a grave-stone under fire, began to dance.

"Wolves!" shouted Briscoe. "That settles to-night's hunt, sure; but you have settled one of the yellow varmints. Whoa! Jim, you old idiot! Here, Mr. Call! hold my horse and give me the lamp. You can't ride that mare up to a dead wolf."

Fastening the lamp on his head he took the gun and went forward. "Here he is!" he cried; "dead as Hector." After stooping a moment he shouted, "There are five shot in his front, two of them in his face. You are surely right about that gun. As my old friend Jones would say, 'Hit flings 'm p'intedly;' but see here, there's no sort of use in our propping around in this neck of the woods any longer; that pack have put every deer away from hereabouts. The moon will be up in half an hour. A good scheme will be to get down to Sim's before daylight, take a rest there to-morrow, and hunt that cover at night, when we will be fresh."

It was so ordered, and back to our camp we rode.

I quickly had a pot of hot coffee, and after a bite of snack we hooked up the ponies, extinguished the fire and rolled out.

"There comes the moon, now. We'll shake the nags out and race right along."

As the sun rose and sent its autumnal rays slanting through the boughs of the scattered tree growth along the secluded margins of Sim's Bayou, Briscoe picketed our horses to graze on tender mesquite grass of the prairie; hardly our blankets were spread in the shade beneath a giant pecan tree, and stretching our tired limbs upon them we soon drifted away into that "sure-enough" kind of sleep that comes to tired hunters lying on the ground. It was some hours later when the first period of sound, restoring slumber was over, that I sat upon my blanket, and glancing through overhanging boughs noticed that the sun had slipped well down the western slope, and then the mare looked intently toward me and whinnied.

A merciful man totes fair with his broncho. "Arise! oh, sluggish son of Big Sneeze!" I cried. "Fetch hither yon lariat-ed brutes, that they may slake their thirst even in the tepid ooze of this muddy slough."

"The thirsty critters may have a suck of warm mud," he responded, "and while I fetch them, be handy-like with your cooking tools, and then we'll mouth a bite." And the hearty fellow strode away for the horses.

After kindling a blaze, I was slicing some bacon, when I saw a gray squirrel skip from one tree to another nearby. "Ah-ha! I need you in my business," thought I, and fetching a gun quickly from the wagon I tumble him from a limb. Making him ready for the roasting, I was struck with the exceeding fatness of the little rodent. Very soon, stretched on a forked twig, sprinkled with salt and just a pinch of pepper, the bit of venison was stuck before the fire. Seeing the fat briskly dripping into the ashes, it occurred to me it would serve to soften our bit of stale loaf, and I placed a tin cup to catch the unctuous drip. While "mouthing our bite," as my Texas friend expressed it, we both sopped our crust in the sweet squirrel grease, and marvelled what a lot of it had been tried out of one little creature.

Briscoe glanced at the declining sun and said, reflectively, while gazing across the prairie, "I think we'll find game to-night over there, where the horses were tied; I saw fresh deer sign. A buck loafed around here last night."

While speaking, he sauntered toward the wagon. "You shall do the shooting to-night," I declared. "Here, in the prairie, where I can see stars and take courses, I can steer as well as not."

"We'll take it turn about," he said, slowly, as he fumbled the things about in the wagon locker. "See here, where's the oil can?"

"The oil can?" I reflected a moment; a cold chill climbed up my spine, and then the mortifying truth jumped on me with both feet—I had set it away from the fire the night before, and came away without it. In a sheepish tone I suggested, "It's back at the other camp."

I shall never forget the patient, melancholy look that Texas man gave me, half pity, the other half rank contempt.

"H'm!" he grunted, "that's thirteen miles away; no time to go for it and back before moon rise. There's not enough left in the lamp to last an hour."

I sat down, mortified beyond measure. "Can we do nothing?"

"Yes, we can jog along homeward," he said, mildly. "I did want to try that gun, but we've had a pleasant day of it, and may have better luck another time."

Would he ever wait such a numb-skull along "another time," thought I.

"Haven't you some loaded bird shells in your gun case?" he presently inquired, "I'll step up the timber a little way and try and bag a mess of squirrels to take home. Suppose you fetch the horses to the wagon, give them a feed of grain, and when it's cooler we'll roll out." And he strode away.

Moodily lighting a pipe, I sat and smoked, feeling meaner than pewter money. I cursed the confounded luck, and heard Briscoe popping away at the squirrels. Presently I went for the horses. One of the lariats had fouled a mesquite bush, and I was some time disentangling it. On approaching the camp again, I saw the fire freshened up, blazing away merrily, while the doughty son of Big Sneeze sat near by composedly, but busily skipping squirrels.

"What a lot of them you've gotten," said I, "but they'll carry better with their hides on."

"See here," said the Texan, "what's the matter with 'circumventing' our gay gazelles with squirrel grease?"

"Do you think it possible?" I exclaimed, as the novelty and feasibility of the project dawned on me.

"Well, now, we might just as well find out about that, practically. Just see there," holding up a skinned squirrel, "did you ever see such fat beggar? Remember what slathers of grease trickled out of that one little chap we had for dinner? There's plenty more of it in these, plenty more of these sort up the bayou yonder, plenty of fire to roast them with, and plenty of time to do it in; so come along. Give those brutes a bite of stuff, get some pans out to drip grease with, and let's set all these kittens a-sputtering."

Within an hour we were fairly through with our trying-out process, and as a result had two tin cups full of melted fat.

About 3 o'clock the next morning, the moon getting up a little way, we rode back to camp, each with a buck athwart his horse's haunches. Both were of Briscoe's kill.

"I can cover four shot holes with my open hand," said Permenus, as, kneeling, lamp on head, he examined the wounds in the breast of one of the dead deer. "She certainly do fling 'em close together."

After swallowing some hot coffee, we hooked up the bronchos; then, standing uncovered, we solemnly pledged our faith in squirrel fat, and drove away in the night from Sim's pecan girt borders in excellent conceit of ourselves.

On the Historic York River.

THE annual gathering of the tribe of Taskinas took place, in December, at the hunting lodge of its chief, Opecanacough, on the banks of the York River, the Honorable, the Colonel, the Squire and the Man from Boston comprising the party.

Owing to the close season of the past few years, quail were abundant, some woodcock were found in the bottoms, wild turkeys were plenty, a gang of fifteen or more frequenting the immediate vicinity of the lodge; black ducks were numerous, with a few mallards, although the redheads were scarce. There has been less deer hunting than commonly this year, and as a result the dogs started one or more each time the hunt went out.

An unusual variation from the daily deer chase came one day when the tribe was invited to a hunt for wild cattle, by a gentleman living near, who nominally owned a herd, descendants of cows which had escaped into the forest some years ago, and which had become perfectly wild, never having been handled or approached by man, excepting when darkies had endeavored to capture the calves.

We assembled one fine morning, the party from the lodge armed with rifles ranging from .45 Winchester through .38-55 Marlin to .30-30 Winchester, but alas we were on foot, and through some misunderstanding on their part the cattle, when started by the hounds, neglected to pass the stands where the riflemen were stationed. The pack consisted of some ten foxhounds, the best deer dogs in the country and two shepherd dogs, which were found very useful when the cattle were brought to bay. Fortunately for the success of the hunt there was a cavalry contingent composed of the neighbors, armed with double shotguns charged with buckshot, and they each succeeded in getting a shot, and in the chase killed three. Then ensued a scene such as is seldom witnessed in this section of the country. At the crack of the gun, almost as if they had sprung from the earth, appeared three or four darkies, each armed with a long, keen-edged knife, and the butchering began on the sward under the greenwood tree. The horses, whinnying, fastened to surrounding trees, the hounds running about, quarreling for bits of the beef, the gleaming blades, and hands crimsoned with gore made a strange sight to those of us who were from the North, and one not readily to be forgotten. Following the rule of the chase, the owner of the cattle, who had redeemed his equity in them by the capture, was expected to divide the beef equally among the participants in the hunt, but, although the party from Taskinas were offered their share, they declined with alacrity, visions of tough beef, made sinewy by running through the forest, possessing no attractions for those familiar with the markets of Richmond and Boston.

To vary the monotony of a daily deer hunt, one of the party visited the neighboring city of Williamsburg, where he was most hospitably entertained by one of the representative citizens of the ancient town, and met numberless descendants of the F. F. Vs.

The day passed all too quickly, in driving to the battlefield, looking over the buildings of William and Mary College, barring Harvard, the oldest college in the country; inspecting its library and viewing the portraits of dead-and-gone celebrities, prominent in the annals of Virginia; peeping into the old powder magazine, now occupied by the local historical society, and possessing a stained glass window in memory of the Royalist Governor Spotswood; visiting the court house, built in

1769; and at last in passing a quiet hour in the old Episcopal Church of Bruton parish, the oldest church building in Virginia, still in good repair, with commemorative tablets set in the chancel walls, and most interesting tombs of departed worthies in the churchyard. One inscription was so fervent that it should be given place here, premising by saying that its author, notwithstanding his faithful sentiments, is said to have married twice afterward:

Here lies all that the
Grave can claim of
Mrs. Ann Samson Brown,
Consort of the
Rev. Soveran Brown.

If woman ever yet did dwell:
If woman ever did excell:
If woman Husband ere adored:
If woman ever loved the Lord:
In human flesh did love and move:
If all the graces ere did meet:
In her, in her, they were complete.

My Ann, my all, my Angel Wife,
My dearest one, my love, my life;
I cannot say or sigh farewell,
But where thou dwellest, I will dwell.

THE ALGONQUIN.

Sombrero Days.

It is a cold and dreary December day; a strong north wind is driving before it a storm of rain and sleet, covering everything it touches with a coating of ice. The Green Mountains and the Adirondacks are shut from view as if Dame Nature, enraged at the elements and the general dreariness of the scene, had drawn a curtain across the face of the country. Down in the protected portions of the bay the seagulls have sought shelter from the pitiless sleet. But out in the open the great rollers are coming in and breaking on the reef with a dull moaning roar, as if they too were adding a protest to Dame Nature's. The saucy little English sparrows are for the once subdued, and have sought shelter under the eaves with many loud chirpings; and following their example, I also will stay under shelter and not venture down town to-day.

Lunch is just over, and I decide to pass the afternoon in my usual rainy day way, in overhauling my hunting and fishing outfits. But after lighting my pipe I decide to let the outfits go; and I unlock a little brass-bound trunk that contains many and many a souvenir of forest, field and stream. How the old things serve to burnish up memories of the past.

That old brass reel, with its twenty or more yards of line wound tightly round its spindle, and yet green where it was dragged over the rocks and moss, when I had the fight with the big cat below the old mill dam on the Blue River of Nebraska. And that bunch of frayed flies and broken leaders, how the trout and bass seem to rise up and confront me; but one pang of remorse darkens memory's pages, as the frayed end of that leader reminds me of the big one I failed to net, and again I seem to hear the laughter of the little mountain brook up in the Wyoming hills when that leader parted and the big one rushed down stream free.

That beaded buckskin tobacco bag, that now contains arrow heads and a few medicine herbs of the Sioux, reminds me of my hunt in the bad lands with Sitting Bull's braves before the fight at Wounded Knee. The broken blade of a hunting knife, the skull of a prairie dog of South Dakota, a pair of beaded moccasins taken from one of Big Foot's braves by a friend in the 9th Cavalry. A horse-hair chain and hat band of the same material bring to mind a trip into sunny Mexico. A bear claw that was given me by Hog Jaw, chief of the Otee tribe. The tusk of a peccary that I shot on the Rio. The polished hoof of an antelope that was killed near the Yellowstone Park; and then I lay tenderly aside article after article till I come to the old battered sombrero of my boyhood days.

Again I see the little band of savages camped under the "three maples" above the pontoon bridge. Five in number, but of that experience only acquired by youngsters who are raised on the frontier. They are Will, Sheely, Harry, the Deacon and myself. Camp has been pitched by the bent and scarred trunks of the three maples, a brisk fire is burning in front of the tent, and Sheely is busy with the frying-pan and coffee-pot, while the Deacon is cleaning a couple of channel cats caught on our way up the river. Will is just returning with a pail of water from the spring, and Harry is getting up wood and arranging a covering to keep it from the storms. This is the sight that gladdens my eyes as I run the little black canoe up on the beach in front of the camp. What more beautiful picture can one desire than the one now before me? The white tent thrown into prominence by the dark background of foliage, the busy figures round the fire, the soft murmur of the river, and all this framed in by a sky painted with the hues of the sun's departing rays. And as I sit and take in this scene, across the river I hear the call of Bob White and the honking of a flock of geese on their way north, for the time is spring. The air is filled with the many sounds of bird life bidding farewell to the departing god of day. And the very leaves seem to share in the general worship, for there is a perceptive rustle and sighing in the tree tops as the sun sinks out of sight. I am rudely aroused from my reverie by the banging on a tin pan and a cry of "muck, muck!" Mooring the black canoe by the side of its mate, and picking up rod and Winchester, I join the group by the fire. Thus, year after year, this little band of "sombrero savages" had camped by mountain, forest and stream, and had roamed the broad Western prairies on their hardy little Indian ponies.

But, ah! I have been dreaming again. And as I knock the ashes from my pipe and reverently put back into the little trunk the treasures of long ago, I am brought back to the present by the clanging of the bells on the electric as they pass the door; the droning of the lake on the bar; the dashing of the rain against my window, which forcibly reminds me that I am "chained to business."

But "manana," there is always a "manana," and maybe one of them will see me again at the old haunts of my boyhood's savage days. But the participants in these camps! Where are they? Some may be camping in the "Happy Hunting Grounds," while others may be in the busy whirl of business; but if they chance to read these lines they may bring back to them as pleasant memories of the past as it does me to call them back to the present.

AK-SAR-BEN.

Natural History.

Rocky Mountain Bears.

A VERY interesting study of the evolution of animal habits and characteristics under changing conditions of life and surroundings is afforded by the bears of the Rocky Mountains during the last twenty years.

Up to within a short time ago, a period so short that to many of us it seems but yesterday, the bear was one of the animals most frequently seen in the mountains. In the old days the bear was a beast of the open country, a daylight traveler, seeking his food when and how he pleased. As neither the white trapper nor the Indian made a practice of molesting bruin, killing him only when the occasion called for it, bears had very little fear of human beings.

More than one old he grizzly has made me give the trail, just because I did not happen to have a gun. I remember one morning, in Colorado, in the days when it was even up whether the Utes or the cow-puncher should possess the land. It was at a horse camp in the mountains, and one of the boys had gone out to bring in the saddle horses. Riding down a trail in the quaking aspens, he came face to face with a big grizzly, and being a polite youth gave the trail and went on. Hunting among the parks for strayed ponies, he met Old Ephraim again, and again gave the trail. But when this happened a third time he came back into camp, remarking that bears were too thick out there for him, and if anybody wanted horses they could get them themselves.

That was a great bear country, anyway. One moonlight night the foreman, hearing a noise at the end of the cabin, went out, and turning the corner suddenly ran slap into three silver tips that had pulled down our supply of venison and were regaling themselves. Instead of coming in quietly, George came in on the jump, yelling for a gun, and as a result all we saw was three shadows slipping into the timber when the rest of us rushed out.

Not long after this I discovered that you cannot always tell how big a bear is by looking at him. The day it happened, one of the boys had a cub up a tree. As he had no weapons, he had tried to kill the cub with rocks, but had only succeeded in knocking it out of the tree. He said that it went off on three legs. As I was coming into camp that evening I passed near the spot where I had killed a buck the day before, leaving the forequarters in the woods. As I came close I saw a small black bear feeding at the carcass. Seeing me, it ran off on three legs, and as my horse was afraid of bears I jumped off and took after it afoot, thinking that I was chasing the lame cub. I overhauled the bear hand over fist, and was within 50ft. when it turned and stood up. To say that I was astonished is putting it mildly. That bear overtopped me by 2ft., turning out to be the biggest black bear that I ever killed. He got a .45-70 through the chest in short order, and when skinning him I discovered that he had eight buckshot in one elbow, the joint being perfectly stiff, which of course handicapped the old fellow.

It is very hard to guess the size of a bear when he is moving in grass or brush. A bear moves with a rolling gait hard to describe, and gives one no idea of his size. One moment he appears rolf, long, and the next he draws up to nothing. Even when one is close up to a bear in open ground you never can tell how big he is until you have him down.

Of course, there are times when a bear appears very large indeed. I remember one big grizzly that rose up out of some brush about 20ft. away once on a time. As I remember that bear, he was at least 20ft. high and 10 wide, while his roar was something awful. At any rate, I forgot what I was there for and did not remember until I was out of that brush. To be sure, the bear had a trap on one foot, but a trap without any clog affects a big grizzly much the same way as pounding his finger does a man.

Those big bears were pretty cranky at all times. A few days before this row one of these old fellows had killed a big stallion, and catching him at the carcass, I cracked him one with a six-shooter just for luck. The bear was standing up on his hindlegs at the time and the bullet barked his neck. The big brute slapped the side of his neck with his paw, let out a roar that could be heard a mile, and then the way he made my pony get up and dust out of there was a caution. When he stopped I kept right on, and went back to camp after a rifle. When I got back the old fellow had gone, but to show how plentiful and bold bears were at that time, I saw five at the carcass at different times that afternoon, killed one of them, wounded another, and let the rest get away.

Even at that time bears were sometimes very cunning. There was one old cinnamon that it took seven days to trap. I had killed a deer and set a trap, and that night the old fellow came around. I had wounded a deer at the same time that I had killed the bait, but had not found it. The old bear, however, picked it up, brought it down alongside the trap, ate it up, pulled the bait out of the pen, ate what he wanted, and went off. And for six nights he came back, every night nearly eating a whole deer, which I took pains to keep ready for him, but never getting caught. By the sixth night I had three traps set for him, and a solid log pen 5ft. high, 15ft. long, and about 2 wide. By this time I had a half wagon-load of bones piled up in the end of the pen, on top of which I used to place his nightly lunch. I had one trap set in the pen, and the other two set where I thought the bear might step. But he didn't. He would come along, step carefully over the trap in the pen, grab hold of his fresh deer, back out carefully again, dragging the bait over the trap and springing it, eat what he wanted and depart. The seventh night, though, he came to grief. I took an

old bouble-barrel, muzzle-loading shotgun of 10-gauge and put ten drams of powder in each barrel; then on top of that I put slugs of lead two inches long. Then I fixed the gun under the pile of bones so that it raked the pen lengthwise, put a new deer on top of the bones, ran a string from the bait to the trigger, cocked both barrels and went down to camp, a mile or so away. An hour or so after dark the gun went off, and directly after I heard the bear roaring. Next morning I went up, but things were not as I expected to find them. The bear had gone into the pen and pulled the bait, both barrels had gone off and never touched him. How it happened I have never been able to figure out. The pen was just wide enough to let him in, the muzzle of the gun was just under the bait, and both slugs were in a quaking asp tree that stood opposite the mouth of the pen. And the bear was in the pen when the gun went off, because the marks of his teeth were on the bait, and he was hard and fast by the hindleg in the trap that had been set at the mouth of the pen. I always thought that when the gun went off in his face he got so badly rattled that he forgot about the trap and backed into it, though how those slugs missed him is beyond me. Of course, he might have been crawling on his belly, and the slugs have gone over his back, but it did not seem as if there were room. And if the charge went between his legs it looks as if the hair would have been powder-burned, which it was not.

The cunning of some of the old bears is almost beyond belief. There was one big grizzly that several of us hunted off and on for years, but neither traps nor still hunting nor dogs had any effect. And he is there yet, waiting for some lucky hunter.

He belongs to a variety of grizzly that inhabits bad-land countries, and is called locally ranger bear. He is a long-legged, slab-sided, big-headed beast, with rough hair. As a rule, they live on cattle, nearly all the bad lands being cattle country. Having to travel, as they do, long distances for food and water, they are great runners, having plenty of wind and staying qualities. Whenever this bear that I speak of came where a trap was set, if he happened to be hungry he would nose out the trap, turn it bottom side up, and eat what he wanted of the bait. But as he generally killed his own food, baits had very little attraction for him. Several times he was taken for a big roan bull by those seeing him after dusk or at a distance, but of the many hunters who were always after him none ever got a shot.

Up until along in the 80s bears were not hunted much; but along about '89 the skins took a jump in price, and at the same time some of the Western States put a bounty on bruin. This made hunting them profitable, and they commenced to decrease rapidly. Before this time hardly any one killed them except during the short season in spring and fall when the fur was good. But now, when every bear, cubs and all, were worth \$10 apiece, the poor brutes had no rest. As a usual thing, bears take bait poorly during the early spring and late fall, but during July and August they take any kind of animal food, carrion or not, greedily. Consequently, most of the bears trapped for bounty were killed when the fur was not good, and any number of bears had only the scalps taken. From this time on bears began to change their habits greatly.

Bears go into winter quarters when the first heavy snows and cold weather begin, which is usually in November in the Rockies. In the old days they would den up right in open country. A bear's winter den is nearly always on a north hillside, where the snow falls deepest, and if possible they choose a place where a drift will form. Sometimes a bear will den up in a natural cave or crevice, but more often will dig himself a hole 10 or 12ft. deep. Nowadays this den is almost always in the roughest country he can find, and is generally pretty well up in the mountains in heavy spruce timber. A bear may make his den early in the season, but until cold weather drives him in he roams around a lot. For nearly a month before denning bears eat very little, or not at all, and before they go in for good the stomach and intestines are frequently clean and empty. The stomach is drawn up into a solid lump like a chicken's gizzard, and the bear is a solid mass of fat, inside and out. Along in February or March, when bruin comes out again, he is still hog fat, and he keeps this fat until the snow is pretty well gone. When he first comes out he does not travel much, but as the weather warms up he soon runs off all his fat, though I have seen very fat bears as late as the middle of May, after the trees were green. As vegetation starts, bears live almost altogether on grass, roots, etc., though, of course, they will often eat meat. Still, I have had baits right among the bears, with bears passing within 50ft. of the baits every night, and it was the middle of June before one of them touched a bait, and then they were at the baits all the time.

Even now bears feed a good deal in the open in the spring, when they are not molested, and spring is by far the best time to hunt them. But, as a usual thing, a bear nowadays keeps pretty well under cover. During the day he finds the thickest brush or timber that he can, and there he stays, slipping away quietly at the slightest suspicious noise. It used to be that if a bear heard or saw something that he did not understand, he would stand up on his hindlegs to look. And if he was suddenly startled he would often after running a way stop and stand up to look back. I have killed several bears in thick brush by getting close to them, knowing about where they were, and then speaking aloud. Bruin would nearly always stand up to investigate, thus giving me a shot at his head. But now a bear that hears a human voice hardly ever stops to look, but gets away on the jump.

The blacks and cinnamons also used to tree very easily. I have run a good many up trees by giving them a sharp run on horseback for a mile or so in open timber, and have run two up trees by chasing them on foot. And twice I have missed bears at rather close range and had them take to trees. In one instance the bear went up the nearest tree; in the other the bear, a she with cubs, bolted a hundred yards or so before she treed. And speaking of cubs, I never saw but one she bear that would not bolt and leave her cubs when attacked. The exception was a small cinnamon, and I got between her and her cub and got charged. Only the other day I saw three of the dogs maul a grizzly cub until you could hear him squall for a mile, and the old bear all the time was standing in the

brush not a hundred yards away, and never offered to attack. But nowadays it is almost impossible to tree a bear or bring it to bay, even with good dogs. It always was hard to bring grizzly bears to bay with dogs, but almost any dog would put a black or cinnamon up a tree in short order. Now a bear will run all day ahead of the dogs before taking to a tree or coming to bay. About the only way to hunt bears at present with any chance of success is in the spring after they begin to take bait well. By stringing out a lot of baits and still-hunting early and late fair luck may be had.

In a country like that around the Yellowstone Park bears are quite plentiful, and in many of the remote parts of the mountains they are still thick enough to give good hunting. In a country where much other game is killed, such as elk and deer, and consequently much offal is left, bears are not at all timid about coming to bait, and one need not be careful about leaving scent behind. This is because they are in the habit of eating offal from which the hunter has been gone but a few hours. But in a country where not much food is left lying around for them, and where they are much hunted, every precaution should be taken. The baits should be placed in as open a place as possible. If they are 200 yds. from cover so much the better, as this gives a chance to stalk without being heard. After a bear comes to a bait once or twice without being disturbed, he is apt to get careless and come early in the evening. It is not much use nowadays to lie by a bait at night, as when one is near enough to see to shoot the bear nearly always winds his foe and does not show up.

Take it all in all, bears, and especially grizzlies, are holding their own fairly well in parts of the Rockies, and unless some new method of pursuit is discovered will give us bear hunting for many years.

WYOMING.

Horns and Rodents.

A GOOD many years ago, when a considerable proportion of the present readers of the FOREST AND STREAM were in their nurse's arms, a spirited discussion was carried on in these columns as to what becomes of the old horns dropped by the deer. A variety of beliefs were expressed on this subject. Some people thought that the deer went off to some secret place and there hid the horns which they lost. Others averred that they ate them; others still that they buried them. Many letters were written, some of which displayed great ingenuity and ignorance, and others more or less knowledge of the facts. The whole correspondence showed that among people at large little was actually known about the subject.

It may be assumed that most people understand pretty well that a deer's horns are dropped just where the

perhaps a question. It may be for something that they find in the horn which they like to eat, or which perhaps is necessary to their well being, or they may do it for the pure pleasure of grinding down their incisor teeth.

The front or incisor teeth of an animal like a rat, woodchuck, porcupine or beaver of course grow from persistent pulps, and continue to grow through life. These teeth are constantly being used on hard substances and wear down very rapidly, and if it were not for the constant growth they would soon be worn away

Mountain sheep horn gnawed by rodents. From Goat Mountain, St. Mary's Lakes, Montana, 1897. This shows one method by which old horns are destroyed and disappear.

down to the gum, would be useless, and the animal might no longer be able to procure its food. These teeth wear away against each other. The back part of the tooth, that toward the animal's body, is formed of dentine and is softer than the front part, which is coated with enamel. The soft, bonelike dentine, wearing down much faster than the hard enamel, keeps the teeth constantly with a keen chisel-like edge. A very familiar picture in books on natural history is the cut of the head of some rodent which by accident has lost one of its incisor teeth, when the opposing tooth in the other jaw, not being worn down, continues to grow, curls about inward and perhaps penetrates even the flesh and skull of the unhappy animal. We reproduce from an early number of FOREST AND STREAM a woodchuck skull, showing what happens when the teeth do not meet.

Now it is certain that many species of rodents, for whatever reason, delight to gnaw horns. A cut is given herewith of an old weathered deer skull on which one of the horns remains. This antler has been gnawed down by porcupines, as shown by the size of the tooth marks, so that in some places it is as thin as paper. Another example of this sort is a nodule of moose horn which comes to us from Canada. This is as large as a small hen's egg, irregular in shape, and presents a half dozen flat faces showing marks of the porcupine's teeth.

We picked up on the side of a tall mountain in Northern Montana the old mountain sheep horn which is figured. This has been gnawed in a dozen places,

Abnormal Growth of Woodchuck Teeth.

chiefly, it would seem, by mice, or possibly by the mountain marmots, or whistlers, a species of woodchuck found abundantly all through the Rocky Mountains. This is the first example of a mountain sheep's horn gnawed in this way that we happen to have seen, but no doubt the rodents whet their teeth to some degree on these, though manifestly, from the very soft horny texture of the sheep horns, they would not be so attractive to the rodents, if tooth sharpening were their object, as the harder antlers of the deer.

We have never seen the horn sheaths of antelope bearing the marks of rodents' teeth. Perhaps these are too soft to attract them. Certainly they are very perishable. We satisfied ourselves on this point on one occasion many years ago when we placed a pair of antelope-horn sheaths in a particular spot one summer and visited them each year when we returned to the locality. The first year after they had been put out

they showed some signs of cracking, the second year they were badly split and curled, while on the third visit a year later nothing could be seen of them except a few hair-like splinters of blackish-brown horn.

It is hardly necessary to occupy ourselves in devising elaborate explanations of the operations of nature when simple and natural ones will do as well. The deer do not go off into a secret place to hide their horns, and indeed it would be difficult to understand what is meant by a secret place in the forest or on the prairie. All places are alike secluded where natural conditions prevail, but so soon as man has found his way to them they cease to be secret. Neither do deer bury their horns. The horns are buried ultimately, but it is by due process of nature working in her slow and silent way, and instead of the deer eating their horns, they furnish horns to be eaten by others, by the small, seldom seen creatures of the grass, the rocks and the woodland, which by their numbers, if not by their size, play a most important part in the economy of nature.

Nannie.

NANNIE was the name of a gentle-eyed creature that was led into the yard one day—all bruised and full of wood ticks. She had been taken from her far forest home when she was but a fragile spotted fawn. Reared on the bottle, she almost seemed to grow up as one of the children of the hunter's family. She followed them in their play, and like Mary's little lamb, attended the district school—but book learning wasn't her role, and when school would "take up" Nannie returned home, only to follow again the next morning. When school closed she took her recreation by going to the pasture with the cows, browsing with them, but returning when the capricious notion occurred to her. At length garden season was "on," and Nannie commenced to make sad havoc with the tender plants. She was the idol of the country family, but her browsing habits and athletic qualities caused her to be brought to town and put on sale. Bruised from her long ride in a lumbering ox-cart, she enlisted sympathy and secured a home. For two or three days amid her new surroundings she suffered with homesickness, apparently missing the children most, for she would run to the fence as children passed, enjoying their caresses intensely. Although only confined in the large yard, she made no effort to escape. Gentle and affectionate, loving companionship, her wild instinct was ever present. A strange sound, and she would dart away.

Fragment of Gnawed Horns.

The passing by of a neighbor's dog would cause every nerve to quiver, and with head erect and eyes dilated, with her grace, beauty and symmetry, she made a picture worthy of a Bonheur.

She was so friendly and so gentle that she grew to be an annoyance to the cook, by coming into the kitchen and taking cabbage, potatoes, etc., from the table, as they were being prepared for dinner. The kitchen had so many openings that she felt no fear of getting into a trap; but it was never possible to get her beyond the middle of the hallway of the house, where she would stand with a wistful look in her wonderful eyes, but no entreaty or tempting food would persuade her beyond what she seemed to consider the "de i line." She would stand on the piazza by the hour chewing her cud, and when tired would contentedly lie down, as if feeling the presence of the inmates within doors; but a sound to which she was unaccustomed would cause her to leap over the railing, the noise and the jump apparently being instantaneous. She would occasionally take playful spells, and with tail and head up run round and round the house until she was all out of breath. Her eating showed the effects of civilization. Candy was a tempting morsel to her, while cake, bread and oranges, saying nothing of sweet potatoes, both raw and cooked, corn and oats, kept her for a time from nipping plants and flowers in the yard. But the greatest surprise in her eating was yet in store for us. Day after day the minnows, kept for the herons, would be missing, but who was the culprit? Nannie had been seen at the tub, but then "Nannie wouldn't eat minnows." One day a boy brought a fresh lot of minnows, and the deer seemed excited over the contents of the bucket; he quietly and without thought handed her a fish and she ate it ravenously and begged for another, and so on till we called "enough"—but the minnow thief had been discovered!

A scene, that should have been photographed, was often witnessed on the veranda steps. In the center stood the deer, with forefeet on second or third step and hindfeet on the ground, taking this position so that she might reach the food from the hands of those on the upper step. The dog and cat on either side of her head, while at the base of the steps the big blue herons

Nodule of moose horn; all that is left of an antler gnawed by porcupines. From Canada. Shows the way in which shed antlers are destroyed more speedily than by natural decay.

deer happens to be at the moment when the antlers become sufficiently loose on the head to part company with it and to fall by their weight to the ground. It is also understood that the two antlers do not necessarily fall at the same time, though usually they fall on the same day. A friend has reported to us that he saw a deer pass over a hill wearing both his antlers, and that when in his pursuit of the deer he next saw it it was carrying only one antler, and that before he shot it it had dropped the second.

In a timbered country, the antlers falling in the forests or in the underbrush are soon afterward partially covered by the vegetation which grows up about them, and when autumn comes they are still further concealed by the dying grass and the falling leaves, and when one considers how small an amount of space even the largest horn takes up, it is not strange that we do not stumble on them more frequently. On the other hand, in old times, in certain parts of Colorado, where, in the late winter and early spring, great herds of elk frequented high bald hills, which the wind kept constantly free from snow, we have seen shed elk antlers strewn so thickly over the ground that it was necessary to wind in and out among them to avoid stepping on or over them. In such places twenty years ago it would have been practicable for a man to have collected each spring many wagon loads of such antlers if he had wished to do so. Similar conditions no doubt prevail now in and near the Yellowstone National Park.

A shed horn is merely dead bone, and when it lies out in the weather is just as perishable as any other bone. It soon becomes white and weathered, begins to split and to become porous on the surface, and as it grows older and older the animal matter leaves it more and more, until at last it splits into fragments, breaks into small pieces and becomes a part of the soil. This process of rotting and weathering, however, is not the only way in which the horns are destroyed and disappear. As is well known, the rodents or gnawing animals which constitute so very large a portion of our fauna like to try their teeth on horns that they may find lying upon the ground. Just why they do this is

stood snapping their beaks in anticipation of the expectant bites of beef—all within a range of 4 or 5 ft. With the supper over and good nature diffusing everything, the dog would rub noses with the deer, while the white cat would roll at her feet in a seductive way, inviting her caresses. At all times the deer's greatest affection was for the cat; exactly as a mother cat washes her kitten, the deer would lick her protegee until it was wet, the cat, in evident satisfaction, turning from side to side so that no spot would be missed.

Within a few weeks Nannie grew bold enough to venture over the fence and shyly investigate surroundings. She soon found a herd of cows and would go off with them at night, returning in the morning. As she approached near home, she would browse along with a supreme indifference to the pleading calls of "Come, Nannie; come, Nannie." That she heard the calls was not questioned, and while she might be close by the gate, she would not jump till we would hide ourselves and she would think no one present. Whether her jumping place was her secret or not, it is hard to say. Once within the yard, her hearing became excellent, and she would come running for her breakfast. During all these weeks Nannie had been petted and fondled so much that when her owner was taken with a dangerous illness, and no attention other than her food was given to her for three weeks, she grew homesick and goodnatureedly sauntered back to her old home, a distance of several miles, where she spoiled a fine potato patch in a very short time.

MINNIE MOORE-WILSON.

KISSIMMEE, Fla.

A Squash in Harness.

REFERENCE was made the other day by Mr. Chas. H. Ames to the experiments conducted at the Massachusetts Agricultural College, at Amherst, some years ago, to determine the expansive force of a growing squash. President Henry M. Goodell has kindly sent us a copy of the report made at the time by President W. S. Clark, from which we give the following description of the famous squash in harness:

The following considerations suggested the idea of experimenting with this plant:

First—It is a well-known fact that beans, acorns and other seeds often lift comparatively heavy masses of earth in forcing their way up to the light in the process of germination.

Secondly—We have all heard how common mushrooms have displaced flagging-stones, many years since in Basingstoke, and more recently in Worcester, England. In the latter case, only a few weeks ago, a gentleman, noticing that a stone in the walk near his residence had been disturbed, went for the police, under the impression that burglars were preparing some plot against him. Upon turning up the stone, which weighed 80 lbs., the rogues were discovered in the shape of three giant mushrooms.

Thirdly—Bricks and stones are often displaced by the growth of the roots of shade trees in streets. Cellar and other walls are also frequently injured in a similar way.

Fourthly—There is a common belief that the growing roots of trees frequently rend asunder rocks, on which they stand, by penetrating and expanding within their crevices.

Having never heard of any attempt to measure the ex-

Fig. 1 represents two nodes of the squash vine. A is the petiole of a leaf, showing vertical strie. B, a staminate flower on a long peduncle. C, a branching tendril exhibiting the mode of attachment to a support, and the double reversed spiral of the portion between the support and the base of the tendril, by which all the branches of a tendril are made to bear their share of the strain, if they secure an attachment; and by which also great elasticity is given to the tendril, and the liability of rupture largely diminished. G, a tendril which, having failed in finding a support, has coiled upon itself and turned back toward the older portion of the vine.

pansive force of a growing plant, we determined to experiment in this direction.

At first we thought of trying the expansive force of some small, hard, green fruit, such as hickory nut or a pear, but the expansion was so slow and the attachment of the fruit to the tree so fragile, that this idea was abandoned. The squash, growing on the ground, with great rapidity, and to an enormous size, seemed on the whole the best fruit for the experiment.

Accordingly, seeds of the mammoth yellow Chili having been obtained from Mr. J. J. H. Gregory, of Marblehead, they were planted on the first of July in one of the propagating pits of the Durfee Plant-house, where the temperature and moisture could be easily controlled.

A rich bed of compost from a spent hot-bed was prepared, which was 4 ft. wide, 50 ft. long and about 6 in. in depth. Here, under the fostering care of Prof. Maynard, the seeds germinated, the vine grew vigorously and the squash lifted in a most satisfactory manner.

Never before has the development of a squash been observed more critically or by a greater number of people. Many thousands of men, women and children from all

classes of society, of various nationalities, and from all quarters of the earth, visited it.

Mr. D. P. Penhallow watched with it several days and nights, making hourly observations; Prof. H. W. Parker was moved to write a poem about it, and Prof. J. H. Seelye declared that he positively stood in awe of it.

Curious facts were noted in regard to all parts of the plant, but among the most surprising were those relating to the development of the roots. Growing under the most favorable circumstances, they attained a number and an aggregate length almost incredible. The primary root from the seed, after penetrating the earth about 4 in., terminated abruptly and threw out adventitious branches in all directions. In order to obtain an accurate knowledge of their development, the entire bed occupied by them was saturated with water, and after fifteen hours numerous holes were bored through the plank bottom, and the earth thus washed away. After many hours of the most patient labor, the entire system of roots was cleaned and spread out on the floor of a large room, where they were carefully measured.

FIG. 3.

The main branches extended from 12 to 15 ft., and their total length, including all subdivisions, was more than 2,000 ft.

At every node or joint of the vine was also produced a root. One of these nodal roots was washed out and found to be 4 ft. long and to have 480 branches, averaging, with their branchlets, a length of 30 in., making a total of more than 1,200 ft. As there were seventy nodal roots, there must have been more than fifteen miles in length on the entire vine. There were certainly more than 80,000 ft., and of these 50,000 ft. must have been produced at the rate of 1,000 ft. or more per day.

Now, it has been said that corn may be heard to grow in a still, warm night, and it has been proved that a root of corn will elongate 1 in. in fifteen minutes. But here are 12,000 in. of increase in twenty-four hours. What lively times in the soil where such vital force is at work! The wonder is that we do not hear the building of these roots as it goes on.

But in addition to the movements caused by the increase of the roots among the particles of the soil, we should remember that solution, chemical affinity, diffusion and capillarity, as well as the absorption of the feeding rootlets, are incessantly at work beneath the surface of the silent earth.

With what amazement should we behold the development of a crop upon a fertile field, if we could but see with our eyes the things which are known to transpire!

The flowers of the squash are arranged in regular succession, one at each node. A female flower is usually succeeded by four males, so that squashes would be produced at every fifth node, if all should set, which, however, never happens. The impregnation of the ovules within the ovary of the female flower requires the deposition of pollen grains from the anther cells of the male

flower upon the stigma of the former under favorable circumstances. The stigmatic surface must be in a proper condition to retain and develop the pollen, which must also be in a perfect state. Bright, warm weather will doubtless aid in the process, though much remains to be observed in regard to it. The pollen grains of the squash are large and rough, and of a spherical form, and consist of an outer and an inner coating of membrane

filled with a proto-plasmic fluid. In the outer coating is a minute orifice, through which, when moistened by the saccharine secretion of the stigma, the inner coating protrudes as a microscopic structureless tube which pushes its way into the tissues of the style and ovary until it reaches the embryo sac of an ovule, which may then become a perfect seed. This contract of the pollen tubes with the ovules is essential to the setting of every squash. The transfer of the pollen grains to the stigmas is usually accomplished by insects, which fly from flower to flower in pursuit of food. It may also be done artificially, and there is reason to believe that the crop of squashes, melons and cucumbers might often be largely increased by attention to this matter in out-door cultivation. When grown under glass, fertilization must always be effected by artificial means. [See Fig. 1.]

The pistillate, or female flower, on the twenty-first node of our growing vine, was carefully impregnated with pollen on the first of August last. The young squash immediately began to enlarge, and on the 15th of the same month measured 22 in. in circumference; on the 16th, 24 in., and on the 17th, 27. Though the rind of the young fruit was very soft, it was now determined to confine it in such a way as to test its expansive power. In doing this, great care was taken to preserve the health and soundness of every part of the squash, and to expose at least one-half of its surface to the air and the light.

The apparatus for testing its growing force consisted of a frame or bed of 7 in. boards, 1 ft. long. These were arranged in a radial manner, like the spokes on the lower half of a wheel, their inner edges being turned toward the central axis. These pieces were held firmly in place by two end-boards 12 in. square, to the lower half of which they were secured by nails and iron rods. A hemi-ellipsoidal cavity, about 5 in. deep in the center and 8 in. long, was cut from the inner edges of the seven boards, and in this the squash was carefully deposited, the stem and vine being properly protected by blocks of wood from injury by compression. Over the squash was placed a semi-cylindrical harness or basket of strap iron, firmly rivetted together. The meshes between the bands, which crossed each other at right angles, were about 1 1/2 in. square. The harness was 12 in. long and the same in width, so that when placed over the squash it just filled the space between the end-boards. Upon the top of the harness and parallel with the axis of the cylinder and the squash, was fastened a bar of iron with a knife-edge to serve as the fulcrum of a lever for the support of the weights by which the expansive force was to be measured. At first an iron bar 1 in. square was used for a lever; then a larger bar of steel, then a lever of chestnut plank, then one of seasoned white oak plank, and finally one of chestnut 5 x 6 in. and 9 ft. long; but even this required to be strengthened by a plate of iron 4 in. wide by 1/2 in. thick and 5 ft. in length. The fulcrum for the lever was also renewed from time to time, as the weight was increased. [See Fig. 2.] The following table shows the weight of iron lifted by the squash in the course of its development:

	Pounds.

24.....	4,120
31.....	5,000

The last weight was not clearly raised, though it was carried ten days, on account of the failure of the harness

irons, which bent at the corners under the enormous pressure of two and a half tons, and consequently broke through the rind of the squash. It was not feasible to remove the harness and substitute for it a stouter one, on account of its being imbedded in the substance of the squash, which grew up through the meshes of the harness, forming protuberances $1\frac{1}{2}$ in. high and overlying the iron bands. When, on Nov. 7, the harness was removed, in order to take a plaster cast of the squash, it was necessary to cut the straps with a cold-chisel, sometimes into several pieces, and draw them out endways. The growing squash adapted itself to whatever space it could find as readily as if it had been a mass of caoutchouc, nor did it ever show the slightest tendency to crack, except in the epidermis. This would often open in minute seams, from which a turbid mucilaginous fluid exuded. In the morning, drops of this would frequently

FIG. 4.

bedew the protuberances, like drops of perspiration. In the sunshine these dried up and fell off as minute globules, resembling gum-arabic.

The lifting power was greatest after midnight, when the growth of the vine and exhalation from the leaves was least.

The material out of which the squash was formed was elaborated in the leaves during the daytime and transferred through the vine to the stem. Through this it was imbibed by the living, growing cells of the squash, which were constantly multiplying by subdivision until their number was many billions, notwithstanding the enormous pressure under which they were forced to develop. This growth was possible only because life, being a molecular force, exerted its almost irresistible power over an enormous surface of cell membrane.

Scarcely less astonishing than the mechanical force exhibited was the ability of the tissues of the squash to re-

FIG. 5.

sist chemical changes and the attacks of mold where the rind was injured by bruises or cuts. Whenever fresh-growing cells were exposed to the action of the air, they immediately began to form a regular periderm of cork, precisely resembling in appearance and structure that produced upon the cork oak, the elm and other trees.

The form of the squash can hardly be described, but may be seen in the drawings, which show the end and the upper side. The weight was $47\frac{1}{4}$ lb., and when opened the rind was found to be about 3 in. thick and unusually hard and compact. The internal cavity corresponded in form to the exterior, but was very small, and nearly filled with fibrous tissue, and plump and apparently perfect seeds in about the normal number. [See Figs. 3, 4.]

The frequent displacement of flagging-stones and the damage often done to brick and concrete pavements and stone walls by the roots of shade trees, considered in connection with the wonderful expansive power of the squash in harness, made it evident that growing roots of firm wood must be capable of exerting, under suitable conditions, a tremendous mechanical force. Upon searching the fields for examples of trees standing upon naked rocks or ridges covered with only a shallow soil, many interesting specimens were readily discovered to demonstrate this fact.

In South Hadley, Mass., a sugar maple was found which had grown upon a horizontal bed of red sandstone. The tree stood upon the naked rock, over which its roots

extended a few feet in three directions into the soil. One root had pushed its way under a slab of the rock which measured more than twenty-four cubic feet, and must have weighed nearly two tons. In the course of twenty years or more, this root had developed to such a size as to raise the slab entirely from the bed rock and from the earth, so that it rested wholly upon the wood.

Upon examining the tree, it was evident that as it stood upon horizontal roots, which rested on solid rock and had a diameter of nearly a foot, and as they had grown by an annual deposition of wood entirely around them, and as the heart, now several inches from the rock, must once have rested on it, and as the rock could not have been depressed, therefore the tree had been lifted every year by the growing wood of the outside layer. Another tree of paper birch having been found growing in a similar manner, one of the horizontal roots was sawed through and the center of the heart was seen to have been elevated 7 in. since the tree was a seedling.

Now, it is clearly demonstrated that the power of vegetable growth can lift a tree, and that it must do so whenever the bed of the roots cannot be depressed. It is evident, also, that old trees on a clay hardpan, or any other unyielding subsoil, must be thrown up by the process of growth. Every person is familiar with the fact that large trees usually have the appearance of having been raised, and their roots are often bare for considerable distances around the trunk. [See Fig. 5.]

This lifting of the tree from its bed would seem to be advantageous to it, by tightening the roots so as to hold it firmly in place, notwithstanding the possible elongation of their woody fiber by the excessive strains to which they are subjected during violent storms. This method of securing the tree in place would be still further improved by the constant enlargement of the roots by the annual deposition of a layer of wood and the consequent filling of any space formed in the soil by the movement of the roots, caused by the swaying of the tree in the wind.

This slight annual elevation of trees, by the increase in diameter of their horizontal roots, furnishes an explanation for the differences of opinion in regard to the question, whether a given point on the trunk of a tree is raised in the process of its growth. While it has been demonstrated by Prof. Asa Gray that two points in a vertical line on the trunk of a tree will not separate as it enlarges, it seems equally clear that both of them may be quite perceptibly elevated in the course of time.

It has been stated, on good authority, that at Walton Hall, in England, a millstone was to be seen in 1863 in the center of which was growing a filbert tree, which had completely filled the hole in the stone and actually raised it from the ground. The tree was said to have been produced from a nut which was known to have germinated in 1812. The above story has been declared false, because, as asserted, the tree could not have exerted any lifting power upon the stone. It is, however, not difficult to see that it may be true, and is even probable.

Yet it should be remembered that the amount of elevation, in any case where it occurs from the increase in the size of the horizontal roots, must depend upon the character of the material on which they rest, and can never exceed one-half the diameter of the largest ones. When, therefore, a writer asserts, as has recently happened, that during a visit to Washington Irving, at Sunnyside, he carved his name upon the bark of a tree beneath which he was sitting in conversation with the illustrious author, and that many years after he went to the place, and, with much difficulty, discovered the identical inscription high up among the branches, far above his reach, it may be safely inferred that the number and exaltation of his feelings interfered slightly with the correct action of his intellectual faculties.

It is evident, in conclusion, that we have much yet to learn about plant life, and that it is very unwise to attempt to explain all its phenomena by a few general statements.

Life has been well styled the loftiest subject of philosophy, but let us not forget that the only way to a sound philosophy is through a knowledge of the truth, and that this is to be obtained in completeness only by laborious and intelligent investigation.

"Old Red Legs."

IN my trips to Lake Champlain I have heard of a large individual of the black duck family, that is taken very late in autumn, and only then. A specimen was sent me some years since, but arrived in such condition as to be beyond saving. The bird was certainly much larger than the usual run of *Anas obscura*, but as above its condition rendered a careful comparison out of the question.

I wrote my correspondent in Milton, Vt., a native and life-long frequenter of the lake, familiar with all its feathered and scaled frequenters, and with a capital observer. His reply was mislaid, and only after a most painstaking search have I been able to find it. I quote verbatim:

"It's but little I can tell you about 'old red legs,' as we call them. I calculate they come from very far north, as they arrive about the same time the geese do. A 'pure blood' has bright red legs, and the body considerably darker in feathers than the ordinary blacks. I have seen them so much darker as to be noticeable at a glance. The upper half of neck to the eyes is very light colored. The 'penciling,' as I would call it, is much more distinct on this duck than on the other kind."

"I think I have seen them that would weigh about one-fifth more, possibly a little better than that. They would run about one-fourth heavier on an average, I should say. I have seen large flocks of them, but as a rule they fly in small parties. They are here very early in the springtime, but only stay a few days. I never knew of their nesting about this lake, consequently I believe they must habit about the same grounds as the geese do for that purpose." * * *

Do you know this bird? Will you give us the benefit of your knowledge? WILMOT TOWNSEND.

[Several species of "black ducks," i. e., ducks of the *Anas obscura* type, have been described for the United States, but it is impossible from our correspondent's description to determine which the bird is to which he

refers. The southern forms of "black duck" usually average smaller than the northern ones, but all gunners are aware that there is much individual variation in this species. Moreover, black ducks and mallards hybridize not very infrequently, and the progeny very often is closely similar to the black duck parent, yet often considerably darker than the average bird, showing a tinge of green on the head—in the male—brightly colored feet and often—also, of course, in the male—a trace of the curled upper tail coverts, which is the sign of the mallard drake. They are also in our experience considerably larger and heavier than the common run of black ducks. Really, to identify a black duck, one ought to be an ornithologist and to have the bird in his hand.]

Baird's Sandpiper in Western New York.

Editor Forest and Stream:

While spending the past season at Lakeside Park, Orleans county, N. Y., I noticed many shore birds at the entrance of Johnson's Creek, running into Lake Ontario. This was directly in front of the cottage we occupied, and therefore I had a good opportunity to observe them; and I noticed there were some species that were new to me, at least some that I had never secured for my collection. I wanted them; but had to be content to use only the field glass on them until the open season, Aug. 15. In the meantime I had wheeled up to Lockport for gun and shells. When the season opened the birds were missing; but ten days later they returned in force, and on the morning of Aug. 25 at the first discharge, and with No. 12 shot, I secured three birds; a sanderling and two that I did not identify. I sent these birds with two semi-palmated sandpipers to Miss Schlegel, of East Aurora, N. Y., and by return mail she wrote that I had secured a new species for western New York, i. e., Baird's sandpiper (*Tringa bairdii*). On Sept. 8 two more specimens were secured; and another on Sept. 15. During this time I had also taken two turnstones (*Arenaria interpres*) and specimens of least and pectoral sandpipers, all of which were sent to Miss Schlegel to be preserved, and she has them all mounted.

I think this is the first record of the occurrence of Baird's sandpiper in western New York. There may have been others taken and not reported, and therefore this must stand as first. J. L. DAVISON.

LOCKPORT, N. Y., Dec. 3.

Moose Head Measurements.

WE measured a few days since at the store of W. W. Hart & Co., 47 East Twelfth street, New York, two moose heads, said to have come from Alaska, which in some respects are peculiar.

Head No. 1 has a spread of $64\frac{3}{4}$ in., with a length of palm, measured from tip of antler to curve inside the brow antler, of $36\frac{1}{2}$ in.; length of palm, measured to curve outside of brow antler, $35\frac{1}{2}$ in. The circumference of beam just without the burr is 9 in. The palm on the left-hand side is somewhat longer, measuring $39\frac{1}{2}$ in. to inside and $36\frac{1}{2}$ in. to outside of brow antler.

The spread of head No. 2 is $65\frac{1}{2}$ in.; length of palm, inside 42 in., outside 40 in. The beam measures $8\frac{1}{2}$ in.

The width of palm in both these heads is very small, running from $10\frac{1}{4}$ to 11 in., but nowhere reaching 11. On the other hand, the points rising from the margin of the palm are long and slender. The brow antler in head No. 2 has a third stout and heavy point nearly a foot long directed downward and forward over the animal's face. On the whole, the heads are of somewhat unusual type.

Weights of Vermont Deer.

ST. JOHNSBURY, Vt., Dec. 27.—Editor Forest and Stream: I noticed some time ago in your paper comments on the weight of deer, and it occurred to me that you might like some items on this subject from Vermont. I have an impression that our deer in many instances have exceeded the average in weight. In obtaining statistics, most of the reports give the estimated weight of the animals, but in many cases the actual weight was given. A great many of the deer weighed over 200 lbs. In some instances I have written personal letters to the men who captured the deer and ascertained the truth of the original reports, and have received in reply four letters giving the actual weight of the deer killed as 231 lb., 261 lbs., 316 lbs. and 370 lbs. George A. Wood, of Woodford, Vt., appears to have taken the heaviest deer captured in Vermont the past season. JNO. W. TITCOMB.

A Tarantula in Court.

Just before Magistrate Simms took his seat in the Essex Market Police Court yesterday morning, and while the liquor-saturated, half-stupefied prisoners were awaiting his arrival, a ragged and frowsy-haired man put his hands over his eyes and cried out: "Take it away, take it away." A policeman, thinking that the prisoner had been seized with delirium tremens, took him out of the line, but scarcely had he gone when another man began to paw the air and dance backward. "I've got 'em, I've got 'em," he yelled. Then a man near the end of the line, who was watching the antics of his fellow prisoners, uttered a cry, and pointed to the bridge. The rest of the unfortunates looked in that direction, and a stampede to the rear railing ensued, which took all the energy of the policemen to stop.

After quiet had been restored, the officials beheld, leisurely crawling along the bridge, an immense tarantula.

"Who owns the bug?" shouted the sergeant. "I do," said a brawny fellow, edging his way through the crowd of frightened men. He was Francis Pope, a porter in a wholesale fruit house at 156 Franklin street. He found the tarantula in the hold of a Panama steamship and explained that he had brought the insect with him for the purpose of showing it to Policeman Byrnes. He had put the insect in a cigar box, and in some manner it had escaped. He apologized to the court for the contempt that the tarantula had shown for judicial dignity and picked it up and replaced it in the cigar box.—New York Times.

Game Bag and Gun.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

Michigan Deer.

PORTLAND, Ind.—*Editor Forest and Stream*: Some of the members of the Michigan Legislature are sportsmen surely, and as certainly readers of *FOREST AND STREAM*. I am advised that there is some agitation of the game-law question, and I hope there will be more agitation, and that when the lawmakers get through with the subject they will have so amended the non-resident and non-export sections as to permit a non-resident to kill one deer (no more), and to take that deer home to his family. Also that they will append a paragraph prohibiting the sale of deer and parts thereof (except the skins of deer legally killed) within the State, and the shipment of deer carcasses to any point without the State. That would, in my judgment, be a sensible law. If they wish to continue a license system, charge each non-resident hunter \$5 for the privilege of killing his one deer.

In company with two friends, C. F. Bender and Dr. C. W. Mackey, I spent the first two weeks of November on my old hunting grounds at Witch Lake. The first week ended before the deer season opened, and as we had but one week more at our disposal we did not think it advisable to pay \$25 for the privilege of killing five deer. There was venison for sale, and it took a good deal less than \$25 worth for our table. We pitched our tent in the timber, and the pine squirrels chattered to us from all sides, while rabbits and partridges occasionally came near our tent. Ring perch took the hook readily, and all in all we spread upon our board all the varieties and delicacies of the season.

In recent numbers of this paper I mentioned the fact that this part of Michigan was opened up by an extension of the Chicago, Milwaukee & St. Paul Railroad, and in discussing this game question these railroads that have made it possible to go in and out and live in that country should not be lost sight of. There are no wagon roads except tote roads, and they are kept open only for lumbering purposes. The ground is so knotty and rocky that to ride on a wagon along one of these roads is a picnic one will not soon forget. The present non-resident law has deprived these railroads of thousands of dollars by limiting travel. Men who would pay car fare and a \$5 license fee for the privilege of killing one deer and taking it home, rather than pay \$25 for the privilege of killing five deer and selling what they can't consume in camp at the market price, i. e. 3c. or 4c. per pound, stay at home and eat venison shot by resident hunters and shipped to market by the underground route.

The intent of the recent law is to make it so expensive that non-residents will stay out. The result is, the law is frequently violated. The more unreasonable a law, the less it is respected. It is an easy matter to "go a-fishing" and eat venison in camp, or at the summer resort hotels. If you can't kill it, you can eat what some other person killed. Many resident hunters violate the law openly and repeatedly. Here is the way one stated the case: "No; I have not worked for four years. I guide and hunt. When I want meat, instead of going to Republic and buying old spoiled beef, I go out and kill a deer." And these men not only kill deer out of season, and for their own consumption, but they kill at every opportunity and sell their surplus.

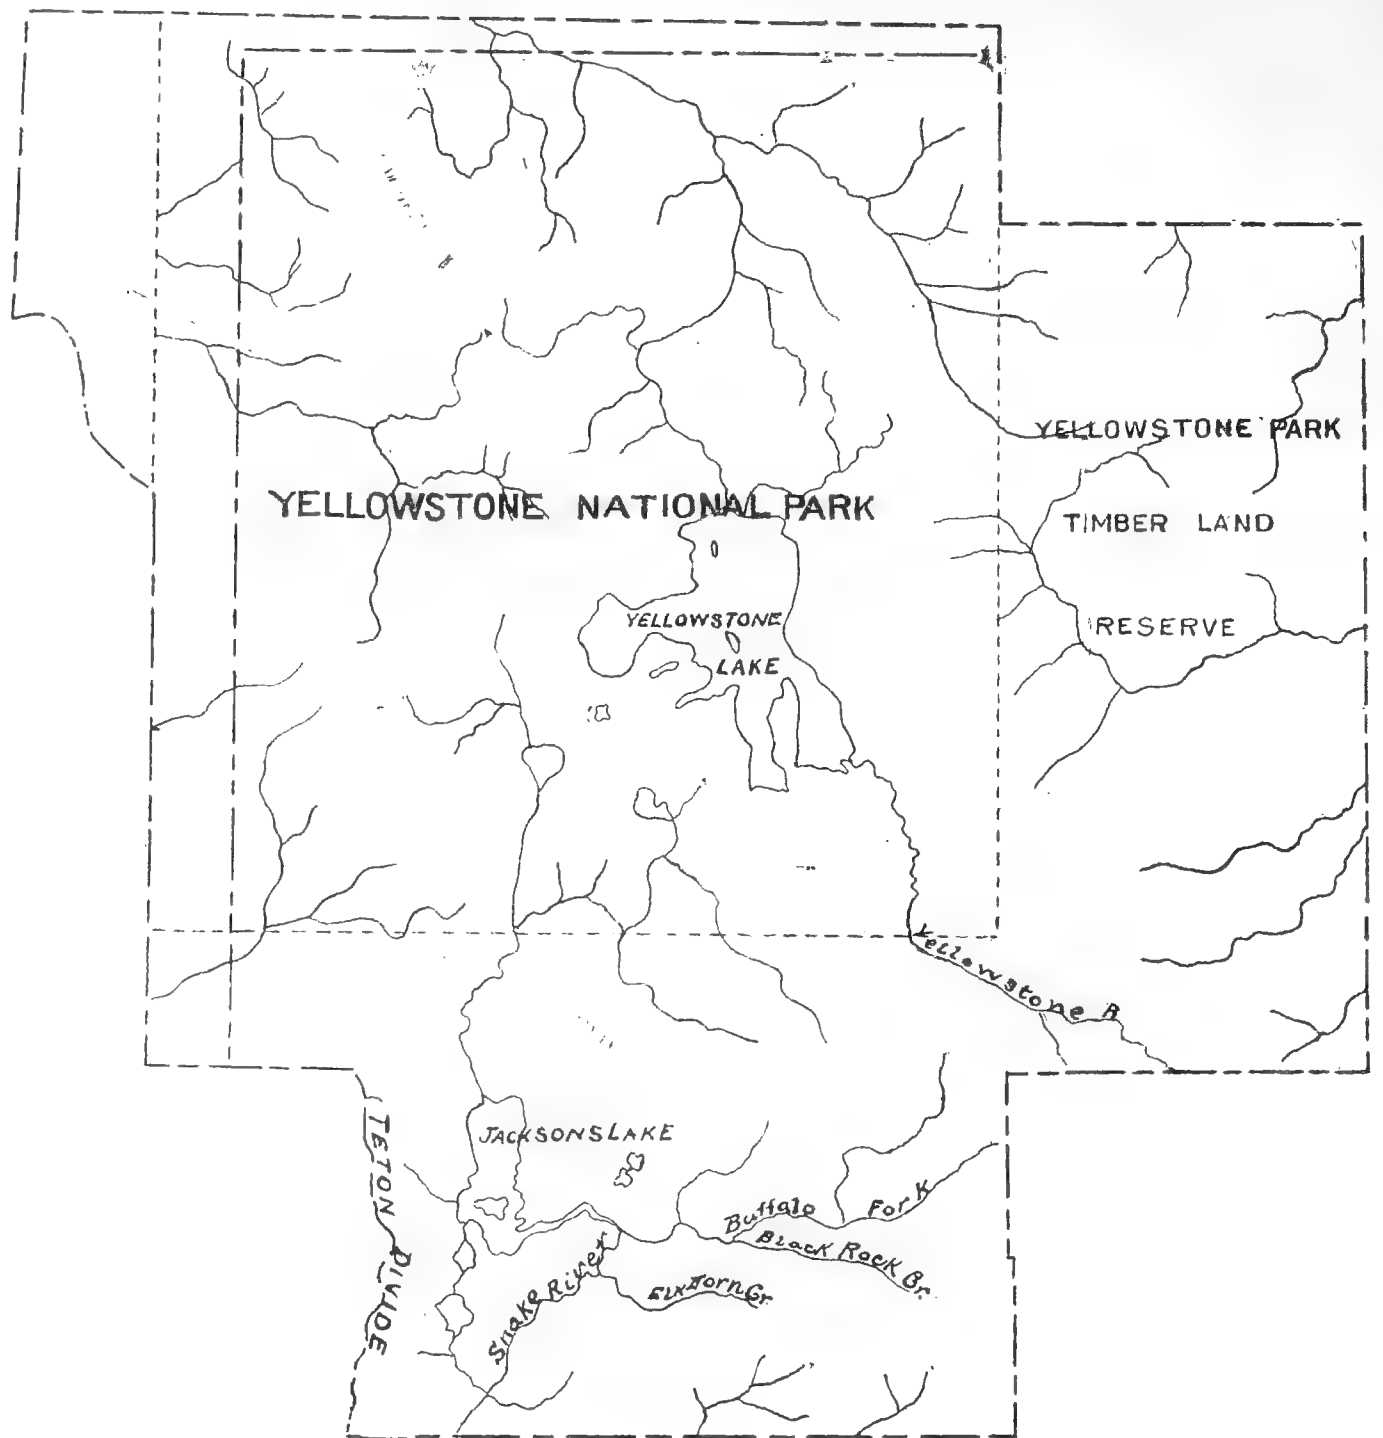

Such men, as a rule, have no abiding place. They must live, of course, but the State does not owe them a living. Many of them are transient, like the deer. Some come from the slums of cities like Marinette and Menominee. I have heard the boom of their shotguns along the railroads night after night. Others may be late arrivals from Canada, or from Sweden, with scarcely any knowledge of the English language. On the other hand, an ex-mayor of one of the largest cities in Wisconsin, a judge, together with other men of like station, shot deer before the hounds within my hearing daily in open violation of the law. The Indians and wolves form a third class. You can classify them to your own liking, but these three types of hunters are chiefly responsible for the destruction of the deer. The baying of hounds, the boom of the shotgun on dark nights, and the bleaching skeletons of deer tell their own story. Bender walked on to two deer carcasses from which only the skins had been taken. I took some long rambles and visited places "to memory deer," but I did not find my lost lake. I found a salted stump that had lured many a deer to its death, judging from evidence at hand.

I want to emphasize the fact that the present non-resident law in Michigan and Wisconsin does the railroads a great injustice, and the amendments suggested would in my judgment increase travel without increasing the slaughter of game. The Chicago, Milwaukee & St. Paul Company has three lines running through deer country. Its employees are courteous and accommodating, stopping trains between stations to take on or let off passengers. They make it possible for white men to exist in the country through which they pass.

A gentleman from near Chicago, whom I met on the train both going and coming, told me on the return trip that he spent two weeks with the proprietor of the Fence River lumber camps on Fence River. That while he was out in the forest he saw a perfectly white deer. It was standing when he first saw it, but while watching it to satisfy himself that he was not mistaken, it jumped over a large log and gave him a perfect view of its entire side.

I also met Mr. G. W. Johnson, who is in the employ of the Pennsylvania Railroad Company. He had recently returned from the Leech Lake country, in Minnesota. He said the Indians at first did not like the brass buttons on his waistcoat, but he made friends with them and they showed him some fine hunting country. He has purchased some land up there and contemplates erecting a club house at Island Lake, north of Brainerd.

I notice that Mr. Hough is after us non-residents with his usual energy. I am inclined to the opinion that Brother H., with all his keen perception and facilities for information, has not seen as much of one side of this

NATIONAL PARK BOUNDARIES—PRESENT AND PROPOSED.

question as the other. Personal observation is the best evidence. It is much easier to stand at a gateway and keep tab on those who go in and out than on those already within. If Mr. H. will camp and mingle with hunters, as I have done, he will see, as I have seen; and if we don't then agree it will be on account of perverse human nature, and I will plead guilty to my share. Let us try the kernel of that nut. By the way, there is a fine large buck hanging outside a butcher's stall in this city. It was shot by a resident of Wisconsin since the season closed.

G. W. CUNNINGHAM.

The Quail's Hard Winter Fight.

ONTARIO GAME AND FISH COMMISSION, TORONTO, Dec. 29.—*Editor Forest and Stream*: There has been no change as yet in the game laws of Ontario. I expect that considerable changes will be made by the next session of the Legislature.

I have been advised by the express companies that 1,822 carcasses of deer have been carried by them during the late open season. It is safe to infer that fully this number must have been killed by settlers under permits; and no doubt large numbers have also been taken out of the woods by teams, of which we have no record. I consider that 4,000 head of deer have been killed during the late open season in Ontario. This is a low estimate.

I enclose a letter from Mr. C. W. Nash, one of our best known naturalists, concerning the protection of quail in winter.

A few years ago fears were expressed that quail, which at that time were nearly exterminated, would in the near future be like the buffalo and wild pigeons, become things of the past. I am glad to know those expectations were not realized, in a large measure due to the exertions of sportsmen, who for several years past have at considerable expense imported large numbers of this beautiful game bird, and turned them loose in their respective localities. Mainly owing to these measures by sportsmen and the protection afforded quail by the game laws, they have largely increased, and at the present time are fairly plentiful in the southwest part of the Province, and there is good reason for believing they will continue to be so if the laws of nature and common sense are carried out. I most strongly endorse Mr. Nash's letter, and feel sure the genuine sportsmen residing in the towns and cities will most heartily co-operate with the farmers and fruit growers in carrying out the measures so ably recommended by him.

E. TINSLEY,
Chief Game Warden.

Mr. Nash writes to Chief Warden Tinsley as follows:

Dear Sir—Can you by any means impress upon the sportsmen, farmers and fruit growers of the southwestern counties of this Province an idea of the great advantages they would derive if they could give the quail of their locality some little food and shelter during the remaining winter months?

It is not necessary to urge upon sportsmen the desirability of increasing the stock of this beautiful little game bird; they are all agreed as to that; but I wish to point out that to the farmer and fruit grower the quail is of the greatest possible economic importance, apart from its value as a game and table bird.

The quail is one of our few species of birds that are directly beneficial to the agriculturist; all its life is spent among the crops upon which man expends his labor and from which he derives his profit, and it is constantly en-

gaged in destroying the insects that are most destructive to the plants raised by his care under cultivation.

For the first two or three months of their lives, young quail feed almost entirely on insects, and each one will while it is growing consume nearly its own weight of them every day. To obtain this quantity the number eaten must be very large. As the birds near maturity they vary their diet by adding the seeds of various weeds, grasses, etc., to their bill of fare, but still take large numbers of insects so long as they are obtainable, grasshoppers in the autumn forming their principal article of food. After these fail they are compelled to find their sustenance in the stubble fields and weed patches, where they glean sufficient grain and seed to keep themselves in good condition until the supply is cut off by deep snow; then it is that our quail suffer from lack of food and die in large numbers from starvation and cold.

If well fed quail can withstand the severity of our winters quite readily, but if starved they, like all animals, gradually succumb to cold, and it is by reason of their inability to obtain food when deep snow covers the ground that so many are lost every winter. This could be prevented if the farmers and fruit growers in the quail counties would afford the birds a little food and protection to carry them over the latter part of the winter season, in which the greatest mortality occurs.

A simple method of affording the requisite protection and food is to arrange three or four forked poles so that they support each other in tent form, and throw over them a little pea straw, buckwheat stalks or waste straw, etc., so as to leave a hollow underneath, into which the birds can go and be safe from storms. Into these places throw a few measures of tailings or waste grain occasionally, and the quail will be able to maintain themselves in safety.

For the slight trouble necessary to provide a few of these shelters around a farm and orchard the farmer and fruit grower will be amply repaid the following season by a good stock of quail to keep down the insects that destroy his crops during the summer, and to provide sport for himself and his friends in the autumn.

C. W. NASH.

Yellowstone Park Enlargement.

THE map here given indicates the approximate boundaries of the Yellowstone National Park in case the Hansborough bill for the enlargement of the Park should become law. Such a map is necessary to a comprehension of what the extension of the Park will mean.

We repeat here the resolutions unanimously adopted at a public meeting held last spring at Jackson, Wyo., and signed by S. N. Leek, chairman, and Frank L. Peterson, secretary. They are as follows:

Whereas, The Jackson's Hole country is the only territory south of and contiguous to the Yellowstone National Park which is susceptible of settlement and cultivation; and

Whereas, The constant agitation of the question of extending the limits of the National Park by annexing adjoining territory has a tendency to retard the normal development of our community.

Therefore, Be it resolved by the bona fide settlers of Jackson's Hole, in mass meeting assembled:

First—As a satisfactory and permanent settlement of all plans for the future enlargement of the National Park by an addition of territory on the south, we do most earnestly recommend the immediate extension of Park control over the territory now embraced in the Teton Timber Reserve, believing that such addition to the Na-

tional Park will amply suffice for the further and better protection of large game.

Second—While we favor the extension of the National Park to the south line of the Teton Timber Reserve, we are unalterably opposed to any other or further extension of the south boundary of the Park so as to encroach upon or curtail the present limits of the Jackson's Hole settlement. We do not believe that it would be either good policy or economy for the National Government to incur the enormous expense necessary to oust the bona fide settlers of a large and prosperous community, merely to extend the game area of the National Park; and further, we are firmly convinced that the addition of the Teton Timber Reserve will satisfy all reasonable demands for an extension of the National Park toward the south, and at the same time allay all apprehensions of actual and intending settlers in the Jackson's Hole country proper.

New England Sportsmen.

BOSTON, Jan. 2.—Dr. Heber Bishop received the congratulations of his friends at the Copley Square Hotel Saturday evening, the occasion being the arrival of the big bull moose killed in New Brunswick by the Doctor, and already noted in the *FOREST AND STREAM*. The big animal was on exhibition, having arrived that day by boat. A lunch was served and the big bull was admired by about 200 of the Doctor's friends, and prominent members of the Massachusetts Fish and Game Protective Association. The taxidermist is to commence work at once on the moose. He is to be mounted on his own skeleton, purposely for the New York Sportsmen's Exhibition in March.

A Bangor, Me., dispatch of Saturday says that the shooting of big game in Maine is ended for the season of 1898. Reports at hand show the season to have been the greatest on record. Returns from the Bangor and Aroostook region, and other sections, show the number of deer killed by sportsmen and shipped by the transportation companies to have been at least 3,032, 159 moose and 58 caribou. More hunters have been in the woods than ever, and they have obtained more game. The records of game transported for six years are as follows:

Year.	Deer.	Moose.	Caribou.
1894	1,001	45	50
1895	1,581	112	130
1896	2,245	133	130
1897	2,940	139	78
1898	3,032	159	59

It is proposed to form a brotherhood of Maine guides. The Rangeley Guides' Association is in receipt of communications from the Moosehead Guides' Association, proposing a State or general association, for the purpose of advancing the welfare of the craft throughout the State. It is proposed to send representative guides to Augusta early in the present session of the Legislature, to formulate a State association.

One of the most remarkable deer shooting seasons Maine, New Hampshire and Vermont have ever passed through has closed with the old year. The early slaughter was great, followed by snows most remarkably early. Snow fell before Thanksgiving and made good tracking, and a great many deer were taken. This snow did not go away, as is usually the case, but was followed at Thanksgiving, and a few days after with heavier snows, making good snowshoeing ever since. With these heavy snows sportsmen from the cities seemed to stop, but not so the local hunters. They have gone after the deer with unusual vigor, and the slaughter has been great. The snow drove the deer to yarding early, and the hunters on snowshoes have found them easy prey. To find a yard of deer has been too easily taken them all. True, the law does not permit of but two deer to the individual, but I met a hunter the other day, a citizen of Maine, who coolly told me that he had taken his own two deer, and two each for his three boys. I suggested that he should have taken two for his wife and each of his daughters, and he did not see the joke, but admitted that he should have done so but for the reason that he had not had the time since the snow came on.

This great slaughter of deer by local hunters will never appear in any records. The railroads do not transport them openly at least, and "registered guides" will have no occasion to make returns of them. But of one thing I am very sure, many of them have found their way directly into the Boston markets. I counted thirteen fresh arrivals of deer hung up in front of one Faneuil Hall Market store on Saturday. That they came from Maine there is not the least doubt, and it is equally sure that they were the results of recent hunting. Almost every market in Boston has been ornamented with fresh arrivals of deer within a couple of weeks. Will the coming Maine Legislature do anything to stop this shipping of deer to market? Or is there sufficient law already, and will the commissioners see that illegal shipping is stopped?

SPECIAL.

Indiana Quail.

ORESTES, Ind., Dec. 22.—Quail are very plentiful out here, and good cover being available the birds have escaped the onslaught usual in a more open, thickly settled country. There is hardly a stubble field about that is not bounded on one side by a wood or thicket. Most of my time being occupied, I have had to be satisfied with a two or three hours' tramp in the morning, several days, bagging from five to ten birds. The other day I started with my dog for a tramp. When about a quarter of a mile from my house she pointed to a briar bush. I walked up and out came two birds. I dropped them in time for another that started a little later. By that time the rest of the bevy were free from the bush, and I got two more with the two remaining shells in my repeater, making five straight shots without taking gun from my shoulder, three going south and two north. As there were only three or four birds got away, I did not follow them, but took a circular route home, not finding anything more to shoot at. Although quail are plentiful, there is hardly any other kind of game to be found here; even the rabbits have all been killed off. 11.

CHICAGO AND THE WEST.

The Old Gun.

I got a letter from my old friend the Mayor the other day. He is or was the Mayor, and he knows where all sorts of quail and grouse are to be found, though he always takes me in there blindfold, and I couldn't for the life of me tell where it is unless I broke my sacred word and licked the Mayor, neither of which things I should like to have to do. The letter of the Mayor says the quail are getting to be so thick that they are a positive popular detriment, and he wants aid in his official capacity. The partridges grow on every bush and fill the air in a dark continuous procession; and would I come and help remedy all this. Therefore today I took down the old gun and looked at the places on the barrels which were worn white in other days. Also I looked through the barrels—I am glad to say that I could see clear through barrels, which shows the condition of the gun. And I have secured me some food for the gun, and am hunting around to see if I can find an old pair of shoes somewhere—for this Mayor is an awful walker. Should all go well, I might, unless something happened, get over to the Mayor's place and help him save the region from an unduly aggressive and cumulatively agglomerated excess of game.

But it was about the old gun I wanted to speak. There are a great many young men who are just now grasping in their hands some hard earned money, and who are just going to blow that hard earned money against a fine new hand-painted, chokebored gun, warranted to shoot 947 pellets of No. 7 shot into a half-dollar at 40yds. My advice to these young men, if they want to shoot game in cover, and not at the trap, is, don't. Order a cylinder bore gun instead. You won't get a cylinder at all, but will duly receive one which will make a "good pattern." Send it back, and get it "opened." It still won't be open. Then take a saw and saw the front end off the gun, and you'll help it a good deal. After that, ream it out some. That is what I did to my old gun, and it is the only good gun I know of anywhere. I never miss with it—except under certain unavoidable and wholly extenuating circumstances—and nobody whoever shot this gun failed to try to steal it. They got it away from me one time down at Memphis, and I never saw it for a year, and everybody in town was shooting it. They fell to scrapping among themselves about who should shoot it most, and that was how I happened to get it back again. This old gun has killed a great many hundred birds—perhaps thousands; because earlier and other owners and borrowers have used this gun much more than I get a chance to myself. I have to take a screwdriver along with me in the field when I shoot it, so I can put it together again once in a while. Sometimes it goes on strike, and I have to rest it so it will be satisfied to go to work again. Still, it goes off every once in a while, and once in a while I kill something when it does go off. That is why I like this particular gun. If there were others like it this world would not be so full of tears, and it wouldn't be so full of game, either. This old gun is a cylinder, or may be a little bit better than that. I never aim at a quail with it, because that is too finicky a way of shooting, and besides is not in the least necessary. I just hold it over in that direction, and I always get the quail—unless there should, as I have above remarked, be something come up which is wholly unavoidable and excusatory. This is a meat gun, and I'll have to be pretty badly broke if anybody ever gets it away from me. And the Mayor has a meat dog. We both have other and better guns and dogs, for far-off shooting and for fancy ranging, but for this close-up shooting, where the quail and partridges are oppressively abundant, we believe that the meat dog and meat gun will be about right. I have a notion to grease the old gun some to-day, just as a mark of affection.

Distinguished Sportsmen.

The Hartford Times, of Indiana, prints the following: "B. F. Davis is the crack shot of the season in this vicinity, so far, in killing fifteen quail at one shot."

The Montpelier Leader, of Ohio, prints this: "G. W. Shaul is the champion 'quail shot' of this section of the county. He took an old smoothbore rifle out one day last week and killed eight quail at one shot, and he says that it wasn't an extraordinary day for quail shooting either. This beats the record for quail shooting so far."

Bags.

A party of hunters from Parsons, Kan., went into the Indian Nations this month and brought back five deer and over fifty wild turkeys.

The sportsmen of Virden, Neb., held a side-hunt last week, and killed 402 rabbits.

The Emerichsville Gun Club, of Indiana, spent three days in Morgan county last week, and killed 338 rabbits. They said if they "had not been worn out" they could have killed twice as many.

The Singing Mouse.

My friend, Prof. J. A. Balmer, now of the Agricultural Experiment Station at Pullman, Wash., writes me the following information regarding a singing mouse. If I am not mistaken this makes the sixth singing mouse to be recorded in the *FOREST AND STREAM* chronicles. Mr. Balmer remarks:

"I was over on Puget Sound last week and heard a very interesting 'singing mouse' story. I was talking with a friend, Mr. A. B. Leckenby, and happened to ask him whether he believed mice could sing. He said, 'Why, sure! Did I never tell you about my singing mouse?'

"He then went on to relate how, when he was 'batching it' in Portland, or somewhere, and where the house was overrun by mice, how almost nightly one particular mouse would regale him with the most beautiful music. 'Yes,' he said, 'I not only believe there are singing mice, but I firmly believe that all mice sing.' He described how the other mice would sit on their hind legs and listen to this one, and he could see their little throats vibrating as if to burst; and he felt sure they were sing-

ing, but that his car was not attuned fine enough to hear them."

Mr. Balmer goes on to say: "I could tell you a nice story of how many hundred mountain trout we caught last summer, and of the bear that tried to help us fish the Lo Lo River, and of the two moose I met on the Eldorado, and of the dead man at the elk lick that we are going in to bury next summer; but maybe you would want to go along."

How to Tan at Home.

J. A. R., of New Orleans, La., asks the following interesting questions about tanning light hides, which I hope several will answer, for it is of interest. Next week I shall find a moment to tell what little I have learned about this sort of thing. Briefly, I may say now that the secret of the Indian tan is the use of animals' brains as grease, the use of plenty of time and labor, and the use of smoke in putting on last touches. The letter follows:

Having read your journal for the past five years, and knowing that few, if any, of the questions asked remained unanswered, I would ask any of the agreeable old-timers to answer this: I am sure that many sportsmen like to have in their den or office the skins of deer or other animals killed in the chase, but would feel proud to say that such skins were tanned or dressed by their own hands.

I have dressed several deer skins myself from directions found in books, but they were not satisfactory. I have always been anxious to know the different methods used by the Indians in dressing skins with the hair on. Should any of my brother sportsmen who are able care to trouble themselves with an answer they will greatly oblige

J. A. R.

They do Ship it.

Mr. H. O. Wilbur, of Philadelphia, paid this office of *FOREST AND STREAM* a pleasant call to-day. Mr. Wilbur has been out West and has observed that a vast amount of game is brought out and shipped out of several States which forbid that action. He wants to know what can be done about it. Nothing, I imagine, but to sit and hope for more wardens, more vigilance and more sentiment in favor of game laws. Canada can keep a game law, because Canada wants it kept.

The Coyote.

The yellow-haired, scrubby, scrawny, hammered-down wolf of the West, known universally as the coyote, has up to recent date been regarded as a nuisance, to be pursued on a purely Ishmaelitic basis, but it seems there is dawning for him a more dignified day. Over in England the man who kills a fox is regarded as no better than a pariah, to be classified only lower than him who shoots a pig in India. Once it was thought sweet and fit to gather a coyote in any fashion possible, from strychnine to rifle. Now I learn that the sportsmen of Colorado Springs have made coyote coursing a high grade social sport, and more than that, they are beginning to protest against the killing, trapping or poisoning of coyotes by ranchmen or other parties. There is some indignation against certain Colorado Springs sportsmen who go out gunning for coyotes, and they are told they ought to be ashamed of their unsportsmanlike conduct, and should leave the game for the dogs. Thus are times and customs changed, although methinks it will yet be many a day before the sturdy Western rancher learns to stay his hand when he gets a chance at a coyote.

The Uniform Law.

During the ensuing month there will be local action in the different States on some of the features of the proposed uniform game law agreed upon in the Warden's Convention in this city last month. Wisconsin will swing into line with this law and its provisions with very fair unanimity. Wisconsin is getting ready to stop spring shooting. The license idea may be said to have taken firm root in that State, and this fact is liable to somewhat disturb a good many men who belong to shooting clubs in Wisconsin, and who may object to paying club dues, and then a \$25 license on top of that. It seems to me that there has been more growth in protective sentiment in the State of Wisconsin this year than for the five years last preceding.

In Michigan the annual meeting of the State Game and Fish Protective League will be held at the Hudson House, Lansing, on Tuesday, Jan. 17, at 1:30 P. M. The matter of proposed changes in the game and fish laws will then be taken up for earnest discussion.

In Minnesota they are getting ready to stop spring shooting, and we may look for pronounced action along the lines of the idea that the State of Minnesota owns the Minnesota game. This will have much to do with the export and sale of game. It will be a loss to Minnesota if Sam Fullerton goes out of office the first of the year, as I fear will be the case. In all the history of Western protection the names of S. F. Fullerton and his legal right-hand man, Tim Byrnes, deserve a very high place. With such men as these, with Senator J. Herbert Greene, of Milwaukee, and Attorney C. E. Whelan, of Madison, with Chase S. Osborne and Charlie Brewster, of Michigan, there can be something actually accomplished in the way of intelligent progress in game matters, and it will be matter of regret should any one of these drop out of the ranks.

Net Results.

The question of non-resident deer hunting has been pretty well hashed over this season, but I may sum it up with the final report from the State of Michigan that that State had 10,000 hunters, who killed 3,000 deer. There were thirteen hunters accidentally killed and nine wounded. This is the record of one State alone.

The Indians.

The Indians and breeds out near Williston, N. D., have been killing game illegally, and Warden Bowers is out with a posse after them.

In Wisconsin the Oneida Indian reservation has been a favorite hunting ground for many people from Green Bay, De Pere, etc. U. S. Indian Agent D. H. George has issued an order that whites will no longer be allowed to hunt on that reservation.

Out in Minnesota the Indian troubles are temporarily quieted. In due time the traders will again make trouble

for the authorities by inciting the Indians to do market hunting. Then there will be another row and another pursuit to the reservation. Thus it will go until finally the traders are suppressed. The Indians themselves are not so bad.

At the Restaurant.

Sometimes I take Saturday night dinner at the table of a fat and unctuous restaurant keeper, who knows a good thing when he sees it. I used once in a while to take a bird in there for him to broil, and he appears to have remembered that fact. The last time I was in he came over to my table and told me beamingly of a bit of news that had just come to his notice. He said he had just seen a trunk full of quail which had been checked out of Wisconsin to Chicago, and out of which he was asked to make some purchases. He seemed to think this the shrewd thing to do. "But prairie chickens are what I want," said he. "They cost 90 cents each these days. I wonder what makes them so high?" For the sake of those who know that kind soul and good sportsman, Bill Werner, who also runs a restaurant, I will say that the man above referred to was not Bill Werner.

"Coeur d'Alene."

The other day, while I was riding along Wabash avenue, I saw, among other odd signs, the inscription borne above the door of a place devoted to liquid refreshments—"Coure de Leine." Whether the owner of this joint meant to say Coeur d'Alene or "Coeur de Leon" I cannot state. It would no doubt have taken a lion hearted man to go against the sort of refreshments he offered. But if his intent was to the other hand, what affront to the reputation of the Coeur d'Alenes!

Round Numbers.

It is often said that a sportsman and his pipe are inseparable. Sometimes the sportsman and the cigarette are also inseparable. A sportsman friend of mine this week figured out that he had in the past twenty-four years smoked twenty cigarette a day, or 175,200 in all.

Law at Jackson's Hole.

News comes from Jackson's Hole country this week that nine arrests have been made of parties who have been killing elk, and that there have been four convictions with fines. Over 1,000 head of elk were killed on the Teton reserve in November, and the residents of Jackson's Hole charge this to Idaho hunters, and have held a mass meeting to take action against such proceedings. This attitude on the part of the residents of this famous neck of woods is singular and gratifying.

Misplaced Confidence.

One day this week Deputy Warden C. E. Brewster dined at the Cadillac in Detroit. The owner trustingly served him quail and venison to order. It was a case of misplaced confidence.

To Cincinnati.

About fifty of the traveling men of Hibbard, Spencer, Bartlett & Co. will leave Monday night for a visit to the Peters Cartridge Co. at Cincinnati. It will be a jolly party, and will be well received by the officials of that company. Mr. Milt Lindsley kindly sent an invitation to the writer to join the party, and naturally I regret very much that this is impossible at the time. E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Pennsylvania Bears and Birds.

WHITEPINE, Pa., Dec. 26.—The warm, lowery weather of last week waked Bruin up, and sent him prowling about the hills, where the hunters, who were also very much awake, found him. Two bears were killed on Little Pine Creek, a few miles above Waterville. One on Keen's Run was shot in its den, and proved to be a 200-pounder. Walter Carson killed one, Bennett the other. The pelt of the best one brought \$25. Several others were seen, and at least two others were wounded. One of these came down the hill near Sam Carson's logging camp and was shot by one of the men at the camp. The other was shot through by John Smith, about five miles above English Center, on what is known as the Blockhouse Creek. In the pursuit of the bears, some of the hunters ran into a yard of deer and saw seven in one place and two more further on. It is reported that one man emptied his magazine of sixteen shots in all at the last two seen, but failed to score. This was on Keen's Run.

Some days before the snow came a large flock of young pheasants were seen by several persons. The flock kept in a thicket of young bushes and briars below the hill road leading from English Centre to Brookside. Dec. 21 or 22 they were seen again by Lewis Griswold, who says they are about half-grown now. There were twelve or fifteen in the flock. This is the first time anything of this kind ever came to my notice, and I have lived among the grouse for forty years or more. Do they sometimes rear two broods in a season?

On Dec. 21, Joe Wood, of this place, succeeded in bringing in a fine fat coon. NEMO.

[It is possible that the first nest of eggs having been destroyed, the grouse began over again, and so her brood was late.]

In a Moose Country.

EDMUNDSTON, N. B.—*Editor Forest and Stream:* Having been in the woods for fifteen days early in December, I will tell you what we saw there. With a gentleman from Pittsfield, Mass., we made permanent camp fifty miles from here; forty of these miles were through woods without a clearing, and beyond even the range of the logger. Leaving camp the first day after straightening up and getting things in shape (for it is no fool of a job to keep warm and comfortable in a tent in December nights in this country), we took a walk of three miles to the top of a ridge and walked into a yard where seven moose had made their home for the winter. A heavy crust was on the snow, and our footsteps breaking through this made a loud noise. This spoiled all chances of getting near any big game, although we tried every known way.

The next day we went in another direction about two

miles from camp, and started three moose, which we must have been very close to, as signs were warm. The next morning we took a directly opposite course, and at about one and a half miles from camp struck another yard of four. Each succeeding day was a repetition of the previous one. On every ridge we found them. Not a day did we go out in any direction but we found their yard just vacated. In all we started twenty-one different moose, and this in a radius of one and one-half by three miles. I have not the least doubt that every hill for say forty by sixty miles is peopled by moose as plenty as this section visited by us.

In March, when snow-shoeing is good and traveling easy, I am going to explore a large portion of this section for the benefit of any who wish to utilize the knowledge. S. J. RAYMOND.

Camp-Fire Flickerings.

"That reminds me."

Mac's Bird Dog.

I was comin' up from the woods wid me axe on me shouldther, whin I met Ryan dhrivin up the road. Where are yez goin? sez I. Home, sez he. What's that follyin ye? sez I. A red dog, sez he, that kem to me down be the wood lot, sez he; de yez want him? Well, sez I, I don't mind, sez I. So I got him by the neck and tuck him down to me boordin house, an sez to the lanleddy, sez I, trow a loaf of bread into me dog, sez I, for I didn't want the poor devil goin to bed hungry. Purty soon the lanleddy sez, Mac, yer dog doesn't seem full, she sez. Giv him another loaf, sez I, an I'll pay you fur id. An wid that I walks out af the house and wint down to see Webber.

Webber's a friend of mine that lived nearby, an I ups and tells him about Ryan givin me the dog. What kind av a dog is id? says Webber. It's a red dog, sez I. I'll go get him, sez I, an ye can see fur yerself.

As soon as Webber claps eyes an him, he sez, He's a bird dog, he sez, a huntin dog, an if ye like, he sez, I'll borry a gun in the mornin an we'll go out an try him, sez he. I'll go, sez I.

So in the mornin Webber comes up an out we wint. As soon as we got to the woods the dog comminces to run up an down as tho he wus crazy. Me and Webber follyed along aither him, an thin we saw him goin slow like up to a brush pile, wan fut afther the other as tho he was walkin on eggs, an thin he stopped still, an humped up his back an lucked at the brush pile, an Webber sez, Mac, what the devil's he doin there? sez Webber. I dunno, sez I, but I'll soon find out, sez I. And I walks up an gives him a push wid me fut, an whisht wint a patridge out of the brush pile an the other side. Webber lucked at me an I lucked at Webber, but we didn't aither of us say anythin.

Off wint the dog again, and purty soon he kem to a big log, an there he stands on three legs wid wan leg curled up undther his belly, an his head stuck out in front. What ails the dog now? sez Webber. He's the biggest fool I ever see; danged if I know, sez I. An I wint over an gev him a kick in the ribs that nearly lifted him over the log. He let a yelp out af him, an up wint another patridge from the other side of the log. De ye think the dang fool dog knowed he was there? sez Webber. I dunno, sez I, an away we wint again afther the dog.

He thried the same game on us two or three times more, and thin Webber sez to me, he sez, Mac, yer dog's no good, he sez, fur he won't bark at all, he sez, and if I wus in your place I'd lave him in the woods, he sez. But anyhow we shtarted for home and the dog follyed along. On the road we met Jim Turner's lad, an Webber ups and tells him all about the hunt. An Turner's lad sez to me, I'll gin ye me single-barld gun fur the dog, he sez. The gun was a Zulu, an not worth much, but annyhow I tuck the gun an Turner's lad tuck the dog, an two or three days afther that he sold the dog to the banker in town for forty-five dollars, and now he sez the banker wouldn't take a hundred dollars fur him.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

An Outing on Great South Bay.

BY FRED MATHER.

WHILE Capt. Smith and his crew of three fishermen occupied the cottage on Great Island I was the guest of Dr. Bashford Dean, and when they sailed away to market we did our own cooking for twenty-four hours. A few days of fried fish diet, strong coffee and fried ham, had rather upset our internal economy, and as a grill or broiler of any kind was an unknown implement on the island, we promised to treat ourselves somehow the next time we were alone, although we had no definite notion just what the treat would be, but it would be some kind of a change of diet. The last trip to Freeport that the crew made brought a lot of lemons for use on sardines—more dyspepsia encouragers—and they were to go again in the morning.

After a breakfast of fried fish the Sleepy Ann sailed away for Freeport, leaving Dr. Dean and me to wash the dishes and to "muck out," as the Captain called it. The phrase struck me as good, and now I muck out my desk and my den. I now know that when Hercules cleansed the Augean stable he was simply "mucking out," only the truthful historian had not run up against that descriptive, if not poetic, term. Conversation and mucking out are not incompatible, else the Doctor could not have asked: "What shall we do with ourselves on this second day of freedom?" Nor I have asked, as I threw a ham-rind to the crabs in a pool near the door, "Freedom from fried things, do you mean?"

"Of a verity, Major, you guess well. We have eaten

too rich food and taken too little exercise. How much exercise have you taken in the past three days?"

"Truly, Doctor, there is no record of it, but I've walked to the landing, full 100ft., a dozen times, have pulled up a lot of sea bass, toadfish and flukes which in the aggregate must have weighed several pounds, without counting the sinkers. But you advocate exercise. Go you, take that ramshackle gun that lets a lot of daylight through the breech, and kill me some game; let it be duck, meadow-hen, yellow-legs or shitepoke. Come back about noon when the tide turns and we will fish. When you return, loaded down with game, you will find a proper method of cooking provided. You stated the fact that I was an old campaigner and insinuated that the aforesaid O. C. should be able to meet such a simple emergency as a substitute for the frying-pan. Go thy way and seek the more or less toothsome duck, the sedgy yellow-legs or the thin, wedge-shaped clapper-rail which is here brevetted a 'meadow-hen.' Lay these gifts of thy prowess at my feet and rely on my word that they will find all the appliances wherewith to put them before an epicure in the style that they would wish to be served in if they had a choice in the matter."

"How can you do it? There is not a grill on Great Island, and nothing to make one of. There are no ducks here now, and only a few meadow-hens and yellow-legs, but I will go out and do my part without further question, trusting to you to do the rest. Please forget my question, it came out in haste. I will try to be the provider, the steward, if you please, and will leave to you the self-appointed duties of chef; of course, you know how to cook over coals or you would not be alive today."

The Broiling of the Fish.

And the morning passed. There were shots off to the north, east and west, on Great Island, which covered some four square miles, and as I heard them I knew that no one was shooting on the island but Dr. Bashford Dean, of Columbia University, and visions of a game dinner came dreamily up as my work of hunting up a grill went on.

Dr. Dean came in about an hour before the flood-tide was at its height and the fishing time was at hand. He laid down, as his morning's work, two magnificent specimens of "sandpiper," the smallest of all the "teeters." Dressed, they might have weighed an ounce, in the aggregate.

As he needed a lesson, I arose and administered it in this way: "The time has come when game birds, beasts and fishes have decreased so that the man who goes out and kills more than he has use for is not looked upon with favor by his fellow sportsmen, and they have invented a vulgar and degrading title for him, whereby he is classed with the swine. You have laid these two royal birds at my feet and I fear that they may not keep sweet until the fishermen return to help us eat them, and it is a sin to waste the gifts of nature."

The Doctor had skimmed his game by this time and they did not loom up so large, but they were nearly as big as canary birds and he gazed fondly on them as he replied: "I think that we can use one for dinner and supper and leave the other for our friends, the fishermen, but what have you been doing? Taking exercise by sitting on the bench and watching the flight of the summer gulls and working your ears to catch the roar of the surf on the outer beach?"

"My eyes rested on a clam-rake, superannuated by rust. At first it was a clam-rake on the puddle's brink, only this and nothing more; but I picked it up in a feeble way and then shouted, 'Eureka!' and would have sacrificed one out of a hecatomb, only there was not a cow on the island. Then I burned the rust off, found some wire to weave across it, and there you are! The best broiler on Great Island!"

The Doctor inspected the improvised grill critically, pronounced it good and asked: "But what have you to broil on it?"

"As the chef, I have merely provided an implement to properly serve such game as the steward brought to camp, but the tide will turn in half an hour, and at high-water slack we can provide something for the grill. I rowed out and bought some oysters from the float and selected some 'mediums' which have never been near fresh water, and as the air is cooler than the water they are in the shade of the piazza. That stew-pan on the bench at my left contains some onions peeled for boiling, but as we cook with wood there is no use in warming them up until we go out and catch our dinner, for it is not well to gorge on sand-peeps, they are too rich; we must have a course of oysters and of fish first."

We went to a little indentation in the shore where the oyster watchers, who were our only neighbors, had thrown the refuse from the eels they had speared the night before, and with a dip-net caught all the bait-fish needed. The toadfish were plenty just then, and they have a way of swallowing a bait before giving a sign of their presence that gives the salt-water angler much trouble to unhook them, for he might as well have his fingers in a fox trap as in their jaws. Several of these pests came in and a few small sea bass, when the Doctor boated a 4lb. fluke. Now, the fluke is a very good member of that tribe of flat fishes which includes the great halibut, the European turbot and sole, as well as the humble flounder, and as the fish flopped on the bottom of the boat and sent mud and scales into the eyes and nose of that famous scientist, he spluttered out: "Confound that fellow; put your foot on him; durn him, I can't see. Pull up the mud-hook and go ashore; he'll do for dinner and I'm as hungry as a cormorant. Hold on till I wash out my eyes. Now go it."

And the Frying-pan Hung on the Wall.

The water was bubbling under the onions and potatoes when Dr. Dean placed two great slabs of fish on a platter and remarked: "In New York these would appear as fillet de sole, but here they are simply cutlets de fluke. As you have eaten the sole in Europe and know that we have no flat fish which equals it, you must be amused to see sole on the menu in New York."

"It depends, my boy, where you see it. Blackford imports sole from England at times, and that means expense to those who know what a delicate thing the

sole is, and only a few restaurants can afford it, but then they have been on ice for a week."

"True," remarked the Doctor; "our fluke, fresh from the water, should equal a sole brought across the sea. I remember the story of an Englishman in France who wanted a fried sole and asked a countryman what sole was in French. As sole and soul are pronounced the same in English, he ordered 'un esprit fried.' But while you broil this fish and get the dinner, I'll make a skeleton of the fluke, for his sides were carefully dissected from the skeleton, leaving the vertebrae and all the ribs."

As I went about my work I thought that if I were dead and were to be skeletonized for a museum, how lovingly Dr. Dean would do the job, for he made more than a dozen skeletons of fishes down there when he might have been having fun with me sleeping on the piazza or watching the gulls. But the Doctor was dissecting or skeletonizing when not fishing or shooting, and a funny thing one skeleton was. It was a little silvery, blunt-nosed shiner, which Capt. Smith called "head-down," a fish so compressed as to be almost a skeleton in life, but with its very high forehead it was comical.

When the onions and potatoes were boiled there was a good bed of coals, and the improvised grill, with its burden of fluke, was heated up, and when one side of the fish was broiled enough it was turned, for the grill was a single action one and could not be flopped. When the Doctor washed up and came in he exclaimed: "Ah!" as he saw the oysters on the half-shell; the dishes of steaming vegetables and the fish, nicely buttered, on a hot platter, and hot plates to serve it on. While we differed as to the comparative merits of lemon or vinegar on oysters, we agreed that a squeeze of lemon was the proper thing on broiled fluke.

"Well now, this is a grand blow-out," said he, "and not a fried thing in sight. If that old frying-pan hanging there could talk, I'd like to hear its opinion of your new way of cooking fish in this camp, wouldn't you?"

"Certainly." But the frying-pan hung dejectedly on the wall in silence while we spitted the sand-peeps and broiled them as a bon bouche.

After dinner we "mucked out," and I reclined on the

ashore, so that all could watch the distant sail, I was not surprised to see the ever-busy Dr. Dean step off into the grass, perhaps to watch the marsh wrens or to see what inducements these salt meadows presented to the milk-weed butterfly, which was abundant; but just as Capt. Smith exclaimed, "Them fellers is goin' to fish our grounds!" that camera snapped on the group. Since the invention of the camera our language has been enriched by a new compound word, which may or may not have got into the dictionaries; it is "camera-fiend."

"HEAD HER FOR THE P'INT.

and I don't exactly know its full scope, unless it means one who always keeps out of range of his own lens, as is the practice of Dr. Dean.

Nothing left now but to get back to the Captain's proposition of mud cove, and away we went. As we neared our cottage our good-natured giant Captain said: "Well, now, it's a little chilly, an' we'll haul until the moon goes down, say about eight, an' if you two don't care to stay we'll put you off at the cottage and you can have the coffee a-bilin' when we git there. How's that?"

This was just to our liking, and we soon had a fire going and things in shape for the wet and hungry men when they came in, chilled to the bone, after two hauls which were largely water. Truly, a fisherman's life is not a happy one, even in the safe waters of Long Island's great bay. Yet the cheerfulness of this particular crew with a lesson for grumblers and discontented soldiers. Rain or shine, hail or sleet, these men toiled waist-deep in water for a meager living. Some weeks their reward would be great, from their point of view, and then there would be weeks when they did not divide a dozen dollars among four men. Their grub was only drawn in part from the water in the shape of the smaller fish, but bread, butter, lard, coffee, sugar and the many other real necessities of life had to come from their sales of fish, and the prices which they got were but a fraction of the price which the consumer pays. As an instance of this, I saw a small yacht pass us and ask if we had a

"EUREKA!"

bench to rest and positively refused to walk, row or fish. "Doctor, I didn't come down here to work, but to get rid of it and to enjoy the Italian saying: 'Dolce far niente.'"

"Yes," he replied, "but it's sweet to do something, sometimes," and "click" went that wretched little camera; "and there you are."

It was dinner-time next day when our boat hove in sight while we were fishing off the point, where we always found plenty of fish at the turn of the tide. We had fished about an hour and a half and had fifty sea bass of ½ to 2lbs., four large flukes, one snapper and the usual assortment of toadfish. As our bait had been all used, we went to the house and waited for our friends. When they tied up we put our fish on ice for others to eat two days later, as we were only eating fish caught in the swim just before each meal.

They brought the usual things; ice, two 10-gallon cans of water, provisions, bananas and a box of those abominable drinks, "pop" and "sasfariller"; high flavored bilge water is much better. If ever men worked hard to earn a good three-ply dyspepsia, it was these good fishermen.

The East Wind Blows.

It was in the middle of the afternoon before they were ready to fish, and Bob Denton and Cap. argued it out where there was likely to be some weakfish. "I tell you," said Bob, "that off east, inside of sandy p'int, we'll be likely to take in some weakfish, but down there near mud-cove it's doubtful if it's worth while to wet the net as long as the wind is in the east." And Bob carried the day, as he generally did.

The wind had shifted to the eastward when the tide turned, a little past noon, and I had felt it, for an east wind, especially on the coast, is one thing that is dreaded. When I arise in the morning, and before looking out, I shiver and know that the wind is in the east. But I went inside of a heavy overcoat. We had gone a mile or two when the Captain ordered: "Put her ashore, Bob, and let's see what them fellers is goin' to do." I had noticed him watching a sail on the other side of the island and had seen Bob and Byron also looking at it, but it did not interest me in the least; my object on this outing was mental and physical idleness. I watched the gulls and occasionally got up energy enough to answer the yellow-legs as they flew high above, but after being confined to the city for over a year, treading the daily mill, for a while I would say with the Italian: "It is sweet to do nothing." Therefore, when the boat was put

"THEM FELLERS IS GOIN' TO FISH OUR GROUNDS."

weakfish, tossing a quarter aboard. Cap. hove to and threw over three 4lb. fish, and then seemed to think he had not given enough for the money!

A Fluke Chowder.

The fishermen, chilled by the east wind and the wet, soon got into dry clothing and had some hot coffee as a bracer; then Bob Denton inquired what was to be had for supper, a very pertinent query, as there had been no move made toward eating. The fish were all in the ice-boxes in the boat, or we would have cooked some, and the pantry only held some salt pork, ham and vegetables.

The Captain's face, always cheerful, lit up with a smile "not as deep as a well nor as wide as a church door," and as rubelets of tobacco-juice coursed down his chin he remarked: "I'm more'n half a mind to make one

o' them fluke chowders, an' I will. Bob, you go an' dress two o' them flukes an' I'll get the rest of the things ready; Byron, you peel six fair-sized 'taters, and Major, you just tend to the inguns; I'll leave that to you, for I know you'll put in plenty. Doctor, you just crank the wood in the stove; Jo Brown, you go set the table."

For the first time I saw the Captain's orders carried out without protest or argument. Chowders are a gross form of food, usually erring on the side of pork, and therefore are to be touched lightly by all who have stomachs more highly organized than the gizzard of a bird, and the lover of chowder and a clam-bake would prefer such a mess to a juicy steak or equally juicy canvasback, just done so as to cut red. This is not an essay on cooking for sensitive and responsive stomachs, but is merely an introduction to my first fluke chowder. Now, a chowder is a "mess," in the strict definition of that term, and is more indigestible than a "New England boiled dinner," where cabbage, turnips, and all the produce of the farm is cooked in one pot, because the "boiled dinner" usually has wholesome corned beef as a foundation, while the chowder is built around greasy fat pork.

With all this in mind I peeled a great lot of onions, sliced and minced them so that they would not show up big, and hinted to Byron that if he peeled a dozen potatoes there would be less room for pork. I had in mind the old verse:

'Different people has different opinions,
Some likes apples and some likes inions,'

and I wanted to impose my likes on the Captain; but as Robbie Burns most truly said: "The best laid plans o' mice an' men aft gang agley."

There are uncounted instances where men have reckoned without their hosts, and this was merely one more. To my horror, the Captain had covered the bottom of the stew-pan with cubes of pork to the depth of two inches! Dr. Dean had the fire roaring; the casserole was put over the fire as Byron dropped the potatoes on the pork, and Bob put in the fish, while the onions fol-

"CLICK WENT THAT WRETCHED LITTLE CAMERA."

lowed. Then the Captain bethought him of a can of tomatoes and that went in, while he stirred the mixture as it boiled and bubbled. I must admit that it smelled good, and also that after proper doses of pepper and salt it tasted good; but that it was a fit conglomeration to insert into a human stomach I deny. Perhaps I may not be an impartial judge of these things, and yet in what scales can we weigh judgment of anything but our own?

Of course, I would not protest by word or look, for I was Dr. Dean's guest, and he in turn did not care to talk of greasy messes, although he had caught me with his camera while telling the Captain that he was eating too much fried stuff. A hungry man has only one idea in his head until he is nearly satisfied. Then he may think that a reckoning will come, but he thinks it in a dull way, as if the future were uncertain.

The morning tides were still low, but of course were getting later. Our room had two beds in it, and we were alone. As we dressed in the morning I remarked: "Doc., that chowder last night was mighty fillin'; I don't think I will want to eat a thing for a week. It tasted good, for we were hungry, but how all these dyspeptic fishermen get away with it is more than can be guessed."

We took a little coffee and nibbled at the bread. The men went about their work of "mucking out" in cabin and ship, the Captain mended the net, and all waited for the tide to come in.

Some Embryo Dogfish.

On the afternoon trip the wind had shifted to the south, and there was none of that depressing feeling which an east wind brings. We had started for some fishing place agreed upon and the Captain was forward, looking out. He saw something which made him exclaim: "Head her for the p'int; there's a lot o' fish there, an' I think they're weakfish." For once there was no dissent from the Captain's order. The "p'int" was shoal for a long way out, and a haul was made in shallow water, and it was a dogfish haul.

Like all fishermen, these men could not spare time to kill their enemies and rivals which were living on and destroying the fish that they were after. The edible fish were killed, but the dogfish, a connecting link between the sharks and skates, were returned alive to the water. When the seine was pursed up so that the fish could be dumped in the boat to be sorted afterward the weight was too great to more than get them to the surface, and the men would seize the dogfish by their tails and throw

them into the water, unharmed. I counted seventy-one dogfish in this haul, and they were from 3 to 5 ft. long. Of course, some of these beasts had been taken on other hauls, but not in such numbers. I recommended a club about a foot long, with a sharp spike in the end to pierce the brain, but it's easier to let them go alive; never mind the future, after us the deluge! That view is common to all net fishermen; we want fish to-day; there'll be plenty more to-morrow.

And now Dr. Dean was busy. This was the time of year, the last of September, when the dogfish were bearing young, and they would leave our coast for the south in a few weeks. He selected two of the largest females, opened them and found embryos from 3 to 5 in. long. One fish had four on one side and three on the other, while the other had one less on each side; averaging six young each. The embryos were quite well formed, and, as is the case with most fishes, the eyes were well developed. There was no way at hand to preserve these specimens, and the Doctor arranged to send alcohol to Bob and have him put up a lot before the dogfish left the coast. The next morning was Thursday, one of the days to be in Freeport with fish for the peddlers, and the boxes were not full, although the dogfish haul of yesterday had panned out well, for the dogfish had gathered where there was food, as the vultures do, but the crew got off at 4 A. M., before daylight, and made a haul or two, but the wind died down and they did not get to the cottage until 10. Then breakfast, and we left with them.

At the railway Bob called out: "Better send the alcohol down at once, for we don't get dogfish every day. Major, I'll send you up some soft-rock crabs as soon as cold weather sets in and—" but the engine whistle blew as the train rumbled out, and the rest was lost.

ANGLING NOTES.

Salmon Casting.

EXPERIENCE teaches the angler much that is not put down in the angling books, excellent as they may be, and it is often the little things, not of sufficient importance for mention in a text-book, that may add to or take away from an angler's success when pursuing his favorite sport.

A very reliable American book upon salmon fishing will tell the fisherman to lengthen his cast on the right or left of the canoe when casting at right angles to the direction of the current (by the way, I never have seen an angler cast directly at a right angle to the direction of the current, but rather at about an angle of 45 degrees), and always to lengthen the cast on the same side of the canoe. Many fishermen do this; in fact, I do it myself, always lengthening the cast on my left. Last June, while fishing the Restigouche River, I had for one day an old Scotchman in the stern of the canoe, and after casting for some hours I asked him if he could cast, and he said a little. So I gave him my rod and proceeded to fill my pipe and rest my weak right shoulder. When the pipe was lighted, I settled back to observe the man's casting, which was of a quality to show that a salmon rod was not a new weapon to him, and I noticed that he lengthened his cast directly behind the canoe, working the fly persistently fairly in line with the canoe before making a cast to the right or left. The more I watched him the more I became satisfied that he was right, and that I was wrong, and it was better to lengthen the cast always directly down stream behind the canoe rather than on the right or left casts. Afterward I found that one of the best native fishermen on the river did the same thing. It may be said that there is little if any difference in the result if one casts true whether the line is lengthened behind the canoe or at an angle on the right or left, but the former looks more workmanlike in comparison. When I took the rod in my own hands again I killed two fish, and as it happened both were struck as I was working the fly behind the canoe after lengthening the line, and one fish came from quite a distance on one side of the fly to get it, but that is not the point. When the line is lengthened behind the canoe the fly is pulling straight with the tip of the uplifted rod, and when lengthened at the side just before the line is recovered the fly is drawing on a rod held at 45 degrees on one side of the canoe and the pull is not so direct. If there is a "slobber cast" at all it is on the angles after lengthening the line, but when the line is lengthened behind the canoe and worked over a space 5 or 6 ft. wide before recovering the angler knows just the amount of line he must handle. The difference between the two styles appears to be very slight, and so it is, but after trying both I rather like the old Scotchman's method, who, by the way, was a better caster than gaffer. Mr. J. W. Burdick, of Albany, and I were the guests of Mr. Archibald Mitchell, of Norwich, Conn., and we were fishing the Alford water. Mr. Burdick had hooked a fish of 32½ lbs. above me, and had passed down river, his fish on one side of me and his canoe on the other, into the fog, which shut him off from my view. Soon after Mr. Burdick had disappeared I hooked a 26½ lbs. fish, and put on the pressure to kill him quickly and get back to my fishing before Mr. B. should return. I asked the old Scotchman if he could gaff from the canoe, and he said yes. When I drew the fish to his gaff he simply raked him up the side with the steel, and the fish was off down stream, apparently as fresh as at first. Again I brought the salmon to the gaff, and again he was raked up the side and ran under the canoe, the leader drawing across the gaffer's neck, but he did not move, and I cleared the line before the fish had fairly got up steam to run for the Dawson water below. As I brought the fish up for the third time, I said, "At least put the canoe where the fish cannot run under it if you miss again." That remark did the business, and the steel went home. Both fish killed that afternoon were killed on a Durham-ranger. I had fished all the morning without a rise, and at noon Mr. Alford asked what I had been using, and I said, "Jock-Scott and dusty-miller," and he said, "This is great water for the Durham-ranger; try one this afternoon." The first fish rose short to the ranger and would not come again, and I tried him with various

flies after resting him, and finally put the Durham-ranger back on the cast and got the fish on first cast.

A Grand Day on Grand Cascapedia.

On my way home from the Restigouche I found that a friend, Mr. James Barnes Baker, was at the Restigouche Club, but when I arrived he was in bed and I would not have him called, for I was to take the train at 1:30 A. M. for Quebec. A couple of weeks ago I was at dinner at the Plaza, in New York, when Mr. Baker came from a nearby table to speak to me. He said that a few days after I left the river he went to the Grand Cascapedia, and in one day in one pool, with not above three drops, he killed seven fish, weighing 41, 40, 38, 35, 35, 30 and 28 lbs., a total of 247 lbs., and an average of 35 2-7 lbs. It is the most remarkable salmon score for one day's fishing that ever came to my knowledge, and when I sent the score to Mr. Mitchell he used the same language in writing about it, that he had never heard of its equal.

This salmon score is not the only remarkable occurrence of the past season in the region of Matapedia, as witness the letter of Mr. Alexander Mowat, of a spawning grilse and a salmon, giving both ova and milt. I confess I had to read his letter twice over to fully comprehend what he had discovered.

A Chance Meeting.

Last September I was seated at luncheon at the Chateau Frontenac, in Quebec, with Col. Andrew Haggard and Mr. E. T. D. Chambers, when Col. Haggard said, "Has it occurred to any one here that it is rather strange that we three men should be gathered at this table? Here is Chambers, of Quebec, author of 'The Ouananiche and its Canadian Environment'; Cheney, of New York, to whom the book is dedicated; and Haggard, of London, who wrote the introduction to the book, and without any previous understanding we have met at this place, quite by chance, as it were, and are lunching together and talking fish and fishing in the land where the ouananiche grows in all its perfection. This world is not so big after all." It was rather curious that the three men mentioned should meet as they did, for I was returning from the Triton Club, ill and miserable, anxious to get home to my physician; my baggage was checked to Montreal, my ticket and berth secured, and it was five minutes after the time for the train to leave when Chambers rushed into the car and rushed me and my rods out and into a cab and up to the Garrison Club; so the meeting came about only by a margin of five minutes. Furthermore, if I had not been ill I would not have been there at all at that time, for I had been in camp but two days when I was obliged to take the back track without having done any fishing worth the mention.

The Leap of the Salmon.

It is doubtful if any reader of FOREST AND STREAM enjoyed the article, accompanied by illustrations, by Dr. Morris, on the leap of the salmon, in the issue of Dec. 24, more than I did, and for this reason:

Something like nine or ten years ago I wrote an editorial article on the leaping powers of the Atlantic salmon, and quoted from the experiments of Dr. Landmark in Norway, showing that some salmon had been known to leap 16 ft. A well-known angling writer detected me as the writer, and took me to task in another journal, editorially, and thought I should know better than to write such stuff when it was well established that salmon could not jump much if any above 6 ft. in height. Then I quoted authorities, books and anglers, to prove that I was right and he was wrong; but I only made the matter worse, for my friend would not be convinced that salmon could jump anything like the distance I had given. Now I am wondering what he will say about the statements made by Dr. Morris, for 18 ft. is more than 16 ft. I have had the pleasure of listening to Dr. Morris' description of his fishing experience in Labrador, but he did not happen to mention the leaping of the salmon or I would have importuned him to do just what he has now done in FOREST AND STREAM. There is an enlarged photograph in my possession of an Alaska salmon in the act of leaping, and it makes the most striking picture of a jumping fish that I have seen, as the fish is of such great size in its enlarged form as to be impressive. There is one thing about it which seems peculiar at first glance, and this is also true of a picture of an Atlantic salmon which I have; the fish is caught as it is nearly at the height of its leap, and the question in the observer's mind is: How will the fish get the lateral motion necessary to reach the crest of the fall, for the leap seems to have been made straight upward from the base of the fall, leaving considerable space between the position of the fish and the top of the fall, which the fish is endeavoring to gain. Not one of the photographs by Dr. Morris gives a similar impression, for every one of the six fish seem to be going over the fall as straight as straight can be.

Landlocked Salmon.

The remarks of my friend Von W. about the unfitness of the name landlocked salmon reminded me of something I had read on that subject, and upon hunting for it I found I wrote it myself in the report of the Fisheries, Game and Forest Commissioners of the State of New York for the year 1895, and this is it:

"The landlocked salmon is another example of inapplicable names for sea fishes. It is not landlocked, and never was landlocked in its original habitat, whether that was Maine, Quebec, Labrador or Sweden. It has been established that the original common name of the fish (in the Indian tongue) was ouananiche, pronounced whon-na-nishe, and that is what it should be called, whether it is found in the Dominion of Canada, Maine, New Hampshire or New York, reasoning from the standpoint of the scientist who calls a black bass "trout-like" because it was the first name applied to the fish. If the first scientific name applied to a fish should hold, why not the first common name, particularly when it is appropriate, musical, distinctive and a departure for once from "tin mouth" and "red eye"? Reforms of this kind can be worked much more effectively through the fishery newspapers and the great body of fishermen, but a fisher-

ies commission may put the seal of approval upon them."

I fear I have not in all cases stuck to what I preached in the quoted extract, but I believe it now, as I did when I wrote it, that it would be far better to adopt ouananiche as the common name of the so-called landlocked salmon, and in this note I will stick to my text and say that I have recently been to Lakes George and Champlain with car No. 1 of the U. S. Fish Commission to plant a lot of fingerling ouananiche—3,000 in each lake. The day that we were at Port Henry a ouananiche of about 5 lbs. was caught through the ice by a perch fisherman. The first plant of fingerling ouananiche was made in the lakes in 1894, when 10,054 were planted in Lake George and 9,770 in Lake Champlain. In 1895 5,000 were planted in Lake George and 5,000 in Lake Champlain. There were no plants in 1896, but in 1897 4,800 were planted in Lake George and the same number in Lake Champlain, making a total to date of 22,854 in Lake George and 22,570 in Lake Champlain. During the summer of 1897, when the fish were three years old, Judge Ducl, of New York, caught a ouananiche of 6 lbs. in Lake George, and the same season one of 3½ lbs. was caught in Lake Champlain. During 1898 nine were caught in Lake George, of which I have record, and seven in Lake Champlain. The fish were from 5 to 6½ lbs. in weight. In Lake George they have round whitefish, Adirondack frost fish, as well as the big lake whitefish, for food; and in Lake Champlain they have smelts. All the ouananiche have come from the U. S. Fish Commission stations in Maine, and it has been the policy of the Fisheries, Game and Forest Commission of New York to concentrate the plants and establish the fish to draw upon them for eggs to stock other State waters.

A. N. CHENEY.

Alaska Fishing.

PHILIPSBURG, Centre County, Pa., Dec. 19.—*Editor Forest and Stream:* This fish story my brother, O. T. Switzer, asked me to send to you for publication. He went to Alaska in August, 1897, has reached Teslin Lake, and during the last summer had the fishing experience which is here written.

E. A. S.
Teslin Lake, Alaska, Sept. 16.—I wonder if you can stand a fish story? You know I have been awfully disappointed in the fishing. While I have taken quantities of fish, it has been the coarsest kind of fishing, void of any skill, only good when you are hungry; but I owe British Columbia an apology and will never do so again. The south end of Teslin Lake, on which I am located, is about one-half mile wide and continues so a distance of nearly two miles. At that point it narrows up and runs through a channel not more than 100 ft. in width. On the left bank there is a perpendicular wall of rock, broken fragments of which have fallen into the water until they have almost closed the channel. On the right bank is a level, sandy beach. It is an ideal spot for fish, and I anticipated great sport when I first saw it and did not lose much time before giving it a trial. I think I have whipped over that spot twenty times with the most attractive flies I possessed, but never a rise. I could take annconnia with a spoon, trolling from a boat, but never a trout. I have one of my nets set at the mouth of a stream a short distance below this, and while passing through these narrows a few days ago I saw an immense trout rise only a few rods from the boat. I went back home and rigged up my fly rod. Had nothing heavier than single gut leaders, and my rod only weighed 4½ oz., but it is the best that can be made, and it is supposed to land any ordinary brook trout, providing you know how. Don't think, however, the maker would recommend it for such fish.

Arriving at the spot, I made a cast, selecting a spot close to a rock which was partially out of the water. At the first rattle out of the box there was a flop, and an electric shock passed through me, completely unnerving me for a second, followed by the zip of the reel. With the first feel of the hook he made his initial rush down through the channel. I had 150 ft. of line, but thought he would never stop, and knew if he did not stop of his own accord before he reached the end of my line that it would be all off. He did, but there was not 2 ft. of line on my reel when he quit. I wanted that fish, but made up my mind to lose him rather than damage my rod. Had there been another man in the boat to row, it would have been very much easier, but being alone I had to handle the boat and the fish also. There was a paddle in the boat, so getting in the stern, I handled the rod with my left hand and managed to keep the boat in proper position with my right. I worked up on him about 50 ft., at the same taking in line. About this time he concluded to change position and started at right angles from the boat. It took both hands on the rod then. The second rush was nearly as long as the first, but owing to the direction he took, did not use up so much line. I worked to within 50 ft. of him before he changed position. This time he came directly to the surface and threw himself clear out of the water. That was the first sight I had of him, and he was a corker. His head was fully as large as Bill Holt's dog Collie. After his examination of things on the surface, he made two complete circles around the boat, and went to the bottom almost beneath me, which enabled me to get in all my line but a few yards. This thing continued, with a slight change in his maneuvers, for over two hours and a half. I never let him rest. As soon as I could get my line in would feel him gently and keep him moving. Finally I grounded my boat on the sandy beach and got on land. By this time his runs were very short, but I could not get him ashore without endangering my tackle, and after once seeing him wanted to keep him if at all possible. When I did get him to shore he was bottom side up and had just a gasp left. I lifted, or rather dragged him out by passing a forked stick through his gills. I took him up to the store, and undressed he weighed 23 lbs. and measured 34 in. It was the longest fish taken this year from the lake by any means, nets, spoon hooks, etc. A fresh-water trout taken with a 4½ oz. split bamboo, single gut leader and a No. 10 fly, ordinary black gnat.

It has been raining all day and blowing hard from the north. I am afraid our summer is about ended. The days, too, are getting shorter; at 6 P. M. we have to light our candles. The trail is finished at last and old prospectors say it is now the best one they have ever

seen. As a matter of fact, one could ride a bicycle from Telegraph Creek to Teslin Lake, barring the hills. Had the work been done early in the season, what a difference there would have been in Teslin to-day. Late as it is, there are more people on the trail now than there have been at any one time during the season. Every conceivable kind of vehicle excepting a baby carriage—push carts, dog-carts and pull-carts, oxen hitched single, double and tandem, yoked and collared, horses fat, lean and sore-backed, donkeys, burros, mules and asses, driving and being driven, all rushing, pushing and scrouging to get to Teslin, whose lake shores they expect to see covered with nuggets. A Boston man dropped in to-day and said: "Any gold close by?" "Not that I have heard of," said I. "What! Really! Well, what are you doing here?" "Too poor to get any farther," said I. "Come, now," he said. "No joking. Is there no gold on the banks of Teslin Lake? That is the only thing that has kept me alive for the last two months. I thought when I once got here the hard work was all done; that accumulating gold when you get in was easy." I told him I knew some old prospectors who had been in the country for the last twenty years, and to-day all they had in the world was the clothes in their dunnage bag.

I have a chance to send this letter, so must bring it to a finish. O. T. S.

Fox Hunting in Dakota.

CHICAGO, Ill., Dec. 15.—In the South they hunt foxes with foxhounds, and join the folk of the old world in calling it absolute treason to kill a fox in any other way. In New England they go not fox hunting, but fox shooting, and consider it sweet and decent to shoot a driven fox with any sort of gun. Out in North Dakota they hunt the fox with greyhounds. I have often seen these dogs kill wolves and jack rabbits, and other animals up to the antelope and deer, but I never saw a fox hunt with greyhounds, and I think never read of one, though, of course, since the greyhounds have become so common in the Western prairie States, they must have been generally used in that manner. Mr. Clint Smith, of Fargo, North Dakota, sends me the following little account of the way they do it out in his part of the world, and knowing Mr. Smith as I do from other hunting with him in that section, I can well imagine the hilarity of these winter fox chases with the narrow gauge hounds.

"The day was a beautiful one," he says, "the sun shone bright and warm, and at fifteen minutes of ten we started with the dog, our party being Charley, old man Pull and myself. We went west to the second tree claim, and then north, and crossed the Cheyenne River; then went west about half a mile. Here we saw a fox, about a quarter of a mile away, on the plowing. We drove as close as we could, and gave a yell, and away went the fox, and away went the dogs, first Rox, then Bob, then Nig. They went to him like a blizzard, made three good, sharp turns and drove him into the black dog, and it was all over with the fox.

"Charley and I walked over and got the fox away from the dogs, and found they had chewed him up somewhat, but not badly. We then started northwest to the Glendale hay land. Passing by some snow drifts in a little piece of stubble, we noticed the rabbit tracks quite fresh, so Pull and I got out to see if we couldn't kick out a jack, which we succeeded in doing, and with a 'Hi yi' to the dogs, they went off in a bunch. They made a nice run, but it was a short one. Rox made the turn and kill, but he had a little the advantage, as he got sighted first and consequently got the best of the start. You should have seen those dogs land on that jack. They fell over each other and stood on their heads in the snow.

"We now worked over toward Canfield, and on the plowing just north of the elevator we saw another fox. We drove toward him, and he worked to the north. I happened to look to the south, and saw still another fox walk out from behind a straw stack. 'Great Scot! Two at once!' said Pull, excitedly. 'The more we kill the more there are.' We drove for the one to the north, he jumped, and away went the dogs. The fox had a big start, but they got to him, and got three or four turns out of him, when he holed. Pull plugged the hole, and is going out to-morrow to dig him out. In the meantime the other fox had turned and run east, and I guess he hit the timber, for we could not find him. This was a little bad luck, but Pull said: 'Good bye, my boys, I'll see you some other time.'

"Charley thought that we had better cross the track now, and go south, so away we went. About a mile and a half south we saw another fox, and here we had the star run of the day. He jumped when we were quite a way from him, but Rox got his eye on him, and with both of the others close up, the fourth race of the day was on. That fox was a clinker. Not a stop did he make, and no look around, but just tended to business. Pull said: 'Look at them boys shovel snow!' and how the snow did fly. They landed him in about a mile, after five or six of as pretty turns as you ever saw, and they were bunched so that we could not tell which one killed. We now had two foxes and a jack, which was pretty good, and so we started for home.

"We drove north and struck the road that goes by Luce

UNBALLASTED SAILING BOAT, 16FT.

Designed by Miss Minnie Doyle, 1898.

Barnes', and we passed his place about 5 o'clock. We had got almost to Fulkrod's, and were talking about one thing and another, when Pull said: 'Say, boys, there is a nice fox,' and there on the plowing, walking around, was a fox. We knew it was getting late, but we wanted that fox, so when we got to the corner we crossed the track and went west. Bob had wrenched his shoulder in the last chase, so we let Rox and Nig catch this one. When the fox jumped Charley gave a yell, Nig caught sight, away he went with Rox after him, and the Derby was on. They ran straight south, almost to Barnes' house, where they made three or four good, sharp turns, and old Rox took him in out of the wet. So our day's sport was over.

"This is how we hunt foxes in North Dakota. This makes twenty-six foxes and nine jacks we have killed this fall with our pack. We saw two nice big flocks of chickens, over 100 in all, I should say."

Yachting.

As the yachting journal of America, the *FOREST AND STREAM* is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

THE labors of the Sound Y. R. A. executive committee have lasted well up to the end of the year, the work entrusted to it at the meeting of Nov. 3 having been completed only on Dec. 27. It is but fair to say that in revising and extending many of the regulations, the committee has done much more than to prepare a table of scantling restrictions; but the necessity for the revision of the cabin regulation, knockabout rules, etc., was too plain to be avoided. As they now stand, the new regulations cover the main points very thoroughly, and offer good inducements to general building and racing in the smaller classes, below 36ft. While experience will develop some defects, we believe that a substantial step has been made toward the regular and systematic improvement of the rules year by year, until a reasonable degree of perfection is attained. The Y. R. A. of Massachusetts has also practically finished its work of revision, even with the new year; in good season for the building of the smaller sizes of yachts.

The Sound Y. R. A.

A MEETING of the executive committee of the Sound Y. R. A. was held on Dec. 27 at the Seawanhaka C. Y. C. house; all the members of the committee except Mr. Hart being present. All the other changes having been disposed of and adopted by the Association at previous meetings, the entire evening was devoted to the details of the Table of Scantling. Mr. Stephens' adaptation of the table prepared by him for the Y. R. U. of the Great Lakes was discussed item by item, and a few clerical changes made, after which it was adopted by the committee. In the two open classes, of 21ft. and 18ft. R. M., an extension of the original table, the committee at a previous meeting decided to make the sizes less than a proportionate reduction from the cabin classes would call for; the planking for the 21ft. class, for instance, being $\frac{5}{8}$ and for the 18ft. class $\frac{1}{2}$; somewhat over the current practice in this type of small sailing boat, and from two to three times as thick as the latest racing construction. After a long discussion it was finally decided to further increase the size of planking and decking to $\frac{3}{4}$ in. in the 21ft. class, and $\frac{5}{8}$ in. in the 18ft. class, and the frames to $1\frac{1}{4}$ and 1in. respectively. This brings the construction of the 21ft. class by Seawanhaka rule rather over that of the 21ft. l.w.l. knockabouts. The question of allowing existing yachts of good construction, but not fully complying with the table, to race in their classes, was discussed; but it was decided to leave this to the different clubs.

The numerous changes of details in all parts of the new rules at the meetings of the committee and the Association have made a great deal of work for the secretary, and the final proofs of the much revised amendments have not yet been made. We shall publish the complete rules as soon as the official copy is ready.

A Lady Yacht Designer.

THERE is no good reason why a lady should not interest herself in a pursuit so artistic and fascinating as yacht designing, but it is a fact that very few do. One of these few is Miss Maimie Doyle, of Kingstown, Ireland, the seventeen-year-old daughter of James Doyle, the designer and builder of the well-known Colleen one-design class. The design here reproduced, from the Yachtsman, is for a 16ft. unballasted sailing boat, the unassisted work of the fair amateur, and does her much credit.

The Canada Cup.

THE Chicago correspondent of the Toronto Globe writes as follows concerning the Canada cup races of next summer:

The coming races will be second in importance only to those in which Sir Thomas Lipton's yacht will meet the defender of the America Cup. In many respects the race on the inland sea will be a rival to the one on the ocean. It will be the first time in the history of yachting that two international events of so great importance have taken place within a single year.

The Canadians, as the holders of the cup, will be the entertainers, and they are making great preparations for the event. Their committees are now at work not only urging the construction of yachts, but planning the event itself. They are hoping that some member of the Royal House of England will be a spectator of the contest that will decide the supremacy of yacht building along the great lakes. Invitations will be extended to the Prince of Wales and the Duke of York. They will be engrossed and sent to England by chosen delegates.

Chicago men are pleased that so much has come as a result of their challenge. Members of the club meet almost daily to act on the propositions that come from local men for building yachts to enter the preliminary contests. Work on some of the boats has already begun, and others will be started in the slip at South Chicago next week. Commodore F. W. Morgan is one of the most active builders.

The America Cup.

WHILE work is progressing regularly both at Fairlie and Bristol, neither Mr. Fife nor Mr. Herreshoff is taking the public into his confidence as to details. Such news as is published on both sides of the ocean in considerable quantity is all unreliable and largely untrue; being absurd or impossible on its face. It is definitely known that work has been pushed on Defender at Bristol, and much of her aluminum has been removed, to be replaced by new sheets and bars. The other metals in the hull are in good condition. The keel mould for the new boat is about finished, and it is stated, but without good authority, that it shows a shorter and lighter keel than that of Defender. It will not be run until the old ship is out of the shop. The most reliable reports about the new Shamrock are to the effect that she will be built by Thornycroft & Co., the noted builders of torpedo craft, at Chiswick on the Thames; where the material will be shaped from moulds and templates sent from Fairlie; the ship being erected at the Blackwall Yard, further down the river. The material is stated to be nickel steel, made by Krupp, of Essen, Germany, the same material that the German 65-footer Kommodore was built of. It is settled that Capt. Archie Hogarth, formerly of the Fife 65-footer Isolda, will command her. One report has it that the construction will be carried out at Harlan & Wolf's yard, Belfast.

Hollow Spars.

THE Spalding St. Lawrence Boat Company, which has made a reputation within the past two years as the maker of hollow spars after the method of L. K. Young, and under his superintendence, is continually improving its product and starts the season of 1899 with a specially fine stock of spruce timber selected for this purpose, much of it being brought from the Pacific Coast. The saving of weight in these over solid spars makes them indispensable in a racing yacht, and with the waterproof cement used gives them a life that was not possible in hollow spars made a few years ago.

FIG. 37.

FIG. 40.

Yacht Designing.—XX.

BY W. P. STEPHENS.

IN the last chapter were described the splines or battens used for drawing the curve lines of a design. They are held in position upon the drawing by metal weights of 3 to 6 lbs. each, of lead or iron. These are made of different shapes, as a rule, each designer having a particular pattern of his own, by which he sets especial store. The main points in a weight are that it shall be of such a shape as to be readily grasped in the hand, that the center of gravity shall be as near as possible to the end which holds the batten, that there shall be a suitable projection for this latter purpose, and that the front of the weight shall be cut away enough at the top to allow the hand and pen to pass without danger of touching.

We have among our most treasured relics a lead weight that was once the property of George Steers, and still bears his name stamped in the bottom.

It is of the conventional shape more frequently used than any other, a rough resemblance to a fish, from which it is termed a "dolphin." It weighs a little less than 3 lbs., and its exact size and shape are shown in the drawings, Fig. 37. A plug of hard wood, about $\frac{3}{8}$ in. in diameter and 1 in. long, is driven into a hole in the fore end, and in this is driven an iron hook with a sharp point, which catches the upper edge of the spline. The weight shown in Fig. 38 is small and compact, a common iron *tenter hook* is driven in the point. A larger weight of very good form, designed, we believe, by Mr. J. Beavor Webb, is shown in Fig. 39. The bottom is a plate of cast brass, the lead being cast on to it. At A is a slight depression, to make a point that will hold the spline. Being quite narrow, this form allows a number of weights to be placed close together on the inside of a sharp curve, which cannot be done with the wide spreading tail of the "dolphin."

What is called a *punt weight* (Fig. 40) dispenses with the wire hook, the weight itself being fastened to a piece of oak, mahogany or other hard wood, called a *punt*. On the fore end of the *punt* a notch is cut, leaving a projecting end to go on top of the batten.

Weights are sometimes made up quite elaborately, a

hollow shell of cast brass being filled with lead and fitted with several sizes and shapes of hooks, made from brass wire and fitted to screw into the casting so as to be changed at will. Fig. 41 shows such a weight; a boss is cast at A, and drilled and tapped, and the tail is notched out at B, to take a piece of rubber, to prevent slipping. In the ordinary *dolphin* a wide rubber band stretched over the tail answers the same purpose.

For specially sharp curves with a stiff batten the ordinary weights, even when placed close together, fail to hold. The weight shown in Fig. 42, an old English pattern, is so shaped that one may be inverted and placed on top of another, thus doubling the weight and increasing the holding power. In the tail of each weight is a hard wood dowel, fitting into a corresponding hole in the head of the other weight. A full set of weights is not specially portable, and a novel form of weight has recently been devised by Mr. John Harvey, a box of cast brass, with a sliding top, which may be filled with shot. In carrying from place to place, as sometimes happens, the boxes may be emptied, being refilled again with new shot when next wanted for use.

The cost of lead is so little greater than that of iron that it hardly pays to use the latter.

Several different forms are used for the point of the *weight*. In some cases the wire hook is filed to a sharp point, as in Figs. 37, 38, which holds the *batten* firmly, but tends to destroy it. Sometimes the end of the hook is flat and blunt, like the point of a small screw-driver, or somewhat as in Fig. 41, to enter the groove on the top of the batten; but this is not a good form, as grooved battens are not the best. The square notch, as in Figs. 40-42, does not mar the batten, and though it has not the holding power of Fig. 37, it is to be preferred. A good end for a wire hook is shown at B, Fig. 37, filed to a square angle and then notched with a hacksaw to a depth of 1-16 in. This point holds well on the ordinary square *batten*, and it can also be used for the thin spring steel *splines* sometimes used for very sharp curves.

The ordinary *punt weight* may be easily made by any amateur mechanic; a good pattern for a weight of about 5 lbs. is that shown in Fig. 40. The pattern is whittled out of dry pine and neatly sandpapered off, a coat of shellac

improving it, though not absolutely necessary. Old lead pipe or scraps of any kind that may be procurable will answer for the castings; as the impurities come out in the melting. An iron quart pot or ladle will serve as a *crucible*, with a common starch box full of fine, dry sand.

The pattern is placed on a flat board, and the box, without top or bottom, is placed around it; the sand is then packed in firmly and the box inverted, after which the pattern may be withdrawn by screwing a common screw-eye into it and rapping it lightly. A board with a $\frac{1}{2}$ in. hole through it is now placed over the sand and held in place by a couple of bricks or other weights, and the molten lead is poured through the hole in the board into the cavity in the sand. The sand must be slightly damp in order to pack firmly and to hold its shape when the pattern is removed, but the board must be perfectly dry, as any water will cause the molten lead to fly. The casting will set in a very short time, and may then be dumped out of the box and the sand used for another casting. After the lead is quite cool, which will take some time, it may be smoothed off all over with an old plane. The *punts* may be made of mahogany or teak, about 5-16 in. thick, though commoner hardwoods will answer. The notch at the point should be just large enough to catch the smallest batten without quite reaching the drawing edge, where the pen would hit it; and at the same time to keep clear of the board, except at the after end, putting most of the weight on the batten. The *punts* will be fastened to the weights by screws, the lead may be painted, the edges of the *punts* shellacked, and the bottom of each covered with green baize or similar material, glued on.

At least a dozen weights are necessary, and even more will be found convenient at times. They may be all of one weight, 5 lbs., or some of them may be about 3 lbs.; the pattern being cut down after the heavier ones are cast. Even where the *punt weights* are preferred, a few of the hook weights, Fig. 37-41, are always useful for special purposes.

We have already alluded to the adjustable curve rulers, made of lead bars or steel springs in combination with rubber, and intended to retain any curve into which they may be bent, without the use of weights. For marine

drawing, at least, we would advise the draftsman to waste no time over them; they cannot be made to take the fair and delicate inflections of a wooden *spline*, nor can they be relied upon to retain the exact shape under ordinary handling. They are in no sense a substitute for the wooden *spline* and the *spline weights*; and, having the latter, there is no necessity to resort to them.

There is one very important class of instruments that may properly be classed at the same time under the three heads of Ruling, Measuring and Marking; being used

FIG. 37.

for the three purposes. The *compass* is strictly a marking instrument, in that it carries either a pencil or a pen; but it is also a ruling instrument, as the pencil or pen cannot be directed freely in any direction, but must move in a circle. With its marking points removed and replaced by a plain steel point, it becomes the *dividers*, a strictly measuring instrument. The *compass* is found in a variety of sizes and styles, the principal one being the regular large *compass* with several interchangeable legs, Fig. 43. The two legs are united by either a tenon or pivot joint. Of the former, the *double-sector* is preferable, one leg being fitted with two steel plates, while the other is divided into three leaves of the metal of which the instrument is made, between which the steel plates fit. By means of a binding

FIG. 38.

screw the joint may be made to move as freely as is desirable. Another form of good construction is the pivot joint; the heads of the two legs being clasped between a yoke forming a handle, while they are centered by two pivots with conical ends.

However constructed, the joint should move smoothly and evenly, whether the points are close together or wide apart. If this is the case, the joint may be screwed up so tight as to prevent any accidental derangement of the points in ordinary use; and at the same time to respond to a moderate pressure of the fingers in adjusting. One leg should be fitted with a hinged joint near the middle, similar to the main joint, but with fewer leaves; in order that the lower portion of the leg may be held at right

FIG. 39.

angles to the paper when drawing circles of large diameter.

The other leg should be fitted with three interchangeable points, each provided with a similar point. One of these should be a plain steel point, one a pen point carrying a right line pen such as will be described later on, and the third fitted to carry a movable lead, as made for lead pencils. In the older compasses, the lower end of the leg formed a split tube large enough to take a specially small lead pencil, of about one-half the ordinary diameter, made for the purpose. A newer form has a screw chuck, the same as in the pencils with movable leads, and uses the same leads. The best form has the split tube of such small size as just to take a movable lead; of good length, so as to grasp the lead without breaking it, and with a binding screw in the center of the split tube, putting an even pressure on the lead for the whole length of the tube.

The movable legs are joined to the main part of the instrument in several ways, the best being the *bayonet* or *socket* joint, Fig. 44. In this the upper end of the leg is turned truly cylindrical and fitted with a feather, while the socket is bored out to fit and slotted to take the feather which prevents the leg from turning. The next best form, Fig. 45, has a pentagonal shank to the movable part, with a socket of similar shape on the main part and a binding screw to keep the two together.

Next to thoroughly good joints, the main requirements of good compasses are that they shall be stiff and rigid throughout, as light as is consistent with this rigidity; and shall balance well in the hand. This quality of perfect balance is most essential in *compasses*, *dividers*, *drafting*

pens and all similar instruments; and is only to be depended upon in those of first-class make throughout.

The steel points may be either the long conical *English* pattern, which has superseded the old triangular points, or the *needle point*. The latter is a piece of tempered steel wire, about 3-32 in. in diameter, and 3/4 in. long, each end turned down so as to leave a very fine point about 1-32 in. long projecting from a square shoulder. This piece is held in a sleeve with a binding screw in the end of the leg. The *needle point* is considered to damage the paper less, where much work is done from one point, than the solid steel point. It is, however, more clumsy and heavy, and somewhat in the way of a clear sight in setting the instrument to any given points on the paper. For those who can handle the *compasses* and *dividers* with the delicacy which such tools really demand, the plain solid point will be found better in every way. The *compasses* are usually fitted with a *lengthening bar*, a straight piece with a male fitting at one end and female at the other, by means of which one leg can be lengthened for drawing circles of large diameter. This piece is by no means essential, and may well be dispensed with. The large *compasses* are much less used in marine drafting than in mechanical and architectural work, and for the former we should prefer a pair with one solid leg with a single joint in the center, ending in the *English point*, the other leg being fitted with a similar point, movable, and also pen and pencil points. The average size for this instrument is about 6 in., and it is also duplicated in a smaller size, of about 3 1/2 in. The larger size will sweep a circle of 12 to 14 in. diameter, with lengthening bar, and

FIG. 41.

from that down to 1/4 in. or less; but it is a clumsy tool for small circles. The smaller size is intended for medium and small circles, but for the latter it is inferior to the *bow compasses*, Fig. 46. In these the upper joint is omitted, the two legs forming a single steel forging with a small ivory handle on top. About the middle of their length they are joined by a long screw and nut, by which they can be drawn together, their upper parts being thin and elastic. They do not permit as much variation of size as the regular *compass* form, but they are more convenient and more accurate for circles within their capacity. They may be had with either plain or *needle point*, but each is made up as a separate tool, *bow-dividers*, *bow-pencil compass* and *bow-pen*.

Theoretically, the small *bow-compasses* will draw the smallest possible circle, but practically there is only one good tool for very small circles, under 1/4 in. diameter.

FIG. 42.

This, the drop compass, Fig. 47, is a comparatively new tool, and differs from the ordinary *compass* and *bow-compass*, in that the whole tool does not revolve in drawing a circle, but the leg which carries the pencil or pen revolves around a stationary axis, a plain, straight leg of steel wire. As the marking leg moves freely up and down on the stationary leg, the pen may be lifted from the paper and poised clear of it until properly adjusted, then dropped lightly and swung around by the thumb and second finger, the central stem being held vertical by the forefinger. With this tool a circle may be drawn almost touching the fine central point.

In all forms of *compasses* and *dividers* the instrument should stand all possible tests that will show the two legs to be in absolutely the same plane, whether closed or opened. In the *compasses* with joined legs, the points of these legs should come accurately together when the main legs are wide apart at the top and the points turned in. In the *spring bows* the sides should be firm and rigid, whether open or closed, and the screw and nut should work smoothly and easily.

For circles over 12 to 14 in. in diameter, the *beam compass*, Fig. 48, is used. This tool consists of a bar of wood or metal of any desired length, at one end being a fixed head carrying a plain or a *needle point*. Another head, carrying a plain point, a pencil or a pen, at will, is fitted to slide on the bar; being clamped in place and provided with a screw for very fine adjustment. The only limit to the diameter of the circle is the length of bar, which can be swung and handled. This tool in a heavier form is used by machinists under the name of *trammel points*.

YACHTING NEWS NOTES.

Utowana, steam yacht, Allison V. Armour, sailed from New York on Dec. 24 for an extended cruise through the West Indies and to Mexico, where the party will proceed inland from Progreso on a botanical expedition. The yacht will call first at San Juan, Porto Rico, and then at Santiago. With Mr. Armour is Dr. C. F. Millsbaugh, curator of the botanical department of the Field Memorial Museum, and Messrs. Allen, Mott and Ischman. Capt. John Crawford is in command.

Pawnee, yawl, has been sold by F. V. Alexandre to T. C. Zerega, former owner of Nymph.

The annual meeting of the Knickerbocker Y. C., of New York, was held on Dec. 22 at the Hotel Marlborough, the following officers being elected: Com., S. H. Mason, Jr.; cutter Moccasin; Vice-Com., W. G. Newhall, knockabout Willada; Rear-Com., H. A. Quackenbush, sloop Viking; Treas., George H. Cooper, Sec'y, J. O. Sinkinson; Meas., John J. Honey; Fleet Surgeon, Dr. F. H. Boynton; Board of Directors, H. Stephenson, F. E. Barnes, Charles W. Schlesinger, Rodman Sands and L. Lochman, Jr. A mess dinner will be served at the club house, College Point, every Sunday afternoon at 2 during the winter. The club proposes to charter a steamer to follow the America Cup races next fall.

The Harlem Y. C. has elected the following officers: Com., John A. Kipp; Vice-Com., H. Hanlein, Jr.; Rear-Com., John Symmers; Fleet Capt., A. Hochstatter; Fleet Surgeon, Dr. J. C. Shannon; Meas., John Wimmer; Treas., J. H. Andrews; Fin. Sec'y, T. B. Bates; Rec. Sec'y, F. S. Sullivan; Cor. Sec'y, S. L. Schneider.

Queen Mab, cutter, J. S. Fay, has been sold through Manning's agency to C. L. F. Robinson, New York. She is now laid up at Morrell's yard, Newburgh.

Gitona, schr., F. B. McQuesten, Boston, sailed from that port on Dec. 26 on a cruise to the West Indies.

Corsair, Com. Morgan's new steam yacht, is on the dry dock at Hoboken, N. J., near the W. & A. Fletcher works. Com. Morgan sailed for Europe on Dec. 28.

The Roberts Safety Watertube Boiler Company has fitted a new boiler in the steam yacht Impatient, W. P. Jackson, Salisbury, Md. The Herreshoff steam yacht Dawn, T. H. Newberry, Detroit, Mich., was fitted with a Roberts boiler about a year ago, increasing the speed with a reduced consumption of coal. Mr. Newberry is now putting another of these boilers in his yacht Truant.

Canoeing.

A Few Stray Leaves from the Log of the Frankie.

On the Wabash.

I.

DAVE and I had always had a desire to explore the Wabash ever since, as little children, we stood on its banks, or on the old Covington drawbridge, and watched its waters flow silently by, and wondered where all the water came from and where it went to, and when it would all get by and stop running.

In after years, when we sailed, rowed, paddled and otherwise got over its surface in all sorts of ways, more or less ingenious, and generally of our own contriving, after the manner of boys, our desire gradually crystallized into shape—to explore its course from its source in and near the great Mercer county reservoir in northwestern Ohio to its confluence with the Ohio at the southwestern corner of Indiana.

The combination of flat-boat, house-boat and steamboat which a few years ago with infinite pains and labor I had designed as the means by which the trip would be made would provoke a smile from the readers of FOREST AND STREAM. Indeed, Dave and I had many a smile ourselves when shooting a ticklish, risky rapid or carrying our canoes around a dam, as we conjectured how that old stern-wheeler would have conducted herself in such an emergency.

A stray catalogue from a prominent builder quickly decided me in favor of the modern cruising canoe; but as the beauty and utility of the modern cruising canoes were only equalled by the altitude of the prices asked for them, the canoe project seemed hopeless until I finally hit upon the idea of building my own canoes, which I did from a simple little plan prepared by Mr. W. P. Stephens, and published in Harper's Young People, modified somewhat to suit our requirements.

Both canoes were canvas canoes. The Belle was 14 ft. in length by 30 in. beam, with a cockpit 8 ft. long by 20 in. wide amidships, tapering to 14 in. at each end.

The Frankie was 14 ft. long by 26 in. beam, with an oblong cockpit 4 ft. long by 18 in. wide. The cockpits of both boats were amply protected by Tredwen hatches, with aprons of oiled muslin fitting close about the bodies of the skippers. The Belle was propelled by a 7 ft. paddle, while the Frankie was driven by a magnificent 9 ft. double blade, which I took the earliest opportunity of exchanging with the captain of the Belle for his smaller and lighter 7 ft., which answered my purpose much better. In addition, both canoes carried a lateen dandy sail, which, when a sail could be used, was stepped forward in place of a mainsail. As might be expected in inland cruising on so small a stream as the Upper Wabash, we had very little use for them during the trip, and when used they answered our purpose as well as a larger sail and possessed the advantage at all other times of taking up much less room than a mainsail. When not in use, they were buttoned alongside the cockpit coaming on deck with light leather straps.

The Frankie carried a light little tent of the Mohican pattern, just large enough to cover the cockpit, while the Belle was fitted with a small A tent, which could be readily converted into a small wall tent by erecting it on the ground on our 7 ft. pike poles; when thus erected it stood 3 ft. off the ground all round at the bottom. A strip of light goods 3 ft. wide was then buttoned all round inside the lower edges of the tent and pegged to the ground at the corners. During the cruise we slept in this tent when the ground was favorable; when not, we slept in our canoes.

Our clothing and personal effects were carried in rubber or oiled canvas navy bags; our blankets were also carried in oiled canvas bags. We carried a sheet-iron camp stove, a mess chest 12x17 in., containing tin cans of coffee, sugar, lard, butter, salt, pepper, etc., together with our knives, forks and spoons, and a substantial lunch for each day's midday meal; the usual supply of tinware and cooking utensils. Our provisionary supply consisted of bacon, potatoes, onions, eggs, biscuits, coffee, sugar, etc. Everything that was not

packed in tin boxes or buckets was carried in small bags of heavy sheeting.

Owing to extreme low water, we decided to abandon the upper part of the cruise and start from Huntington, on Little River, two miles above its junction with the Wabash, and about ninety miles below the reservoir.

II.

The Wabash, at the mouth of Little River, where we first reached it, is about 150 to 200 ft. wide. We found it a succession of clear, still pools some 2 or 3 ft. deep—in some instances much deeper—and swift, gravelly rapids. In the rifts the water—which in the pools spreads evenly from bank to bank—contracts to a narrow, deep chute and pours swiftly down over the gravel reef, which occasions the rapid. In a very few instances the rapids are broad and shallow, but in most cases we found good water, although the river was at quite a low stage. The banks are steep and gravelly, and the entire bed of the river—banks, pools, rapids, etc.—is profusely studded with boulders and rocks of all conceivable sizes and shapes, making the running of the rapids somewhat exciting.

After the Mississinewa comes in the river increases in size and changes its character to such an extent as to almost justify the forming of a third river from the union of the other two—the Mississinewa being almost or quite as large as the Wabash. We found but few pools below the Mississinewa, but a succession of swift, rocky, gravelly rifts and rapids—beautiful canoeing water, in fact—clear down to and below the Tippi canoe, to where the river flows deep and still, near Lafayette.

III.

A couple of miles or so below La Gro, as we slipped smoothly down over a gravelly little rift into a deep, black pool up under a high bank, we were hailed by a man plowing in the field on top of the bank, who asked us if we had seen Jim Conner. We confessed to the fact that up to date Jim had not been visible to us, whereupon the man informed us that Jim had ridden up along the river bank on his horse some time previously looking for us and had left word that we were not to pass Wabash without landing and looking him up. Jim was an old college friend of ours, and Dave had written him a card from Huntington before we sailed announcing our cruise and asking him to look out for us at Wabash about Friday afternoon; and we were quite gratified at the interest he seemed to be manifesting in us. A couple of miles below we passed a fishing party comfortably disposed on a grassy bank in the shade of a couple of fine old elms. We were hailed and informed that Jim Conner had ridden by shortly before and had left word that we must stop at Wabash. We thanked our informants, assuring them that we would surely endeavor to do so, and were soon out of sight behind a wooded point a short distance below. Half an hour later, on rounding the point of an island, we came upon an ancient disciple of I. Walton dozing over half a dozen fish poles "set" in the bank, of whom I bought a fine string of bass. He also related the Conner anecdote, and we thanked him and paddled on. Half a mile below a squad of small boys in swimming imparted to us the same information, and we reached the conclusion that our friend Conner had posted the entire river population in regard to us, with instructions to look out for two suspicious looking characters in small boats, who were running the river, and instruct them to stop at Wabash. Presently we have in sight of the city, when Jim himself was discovered hastening over the hill top, and in a few minutes more we made a landing, and he was fraternizing with us on the bank—portly, full-bearded, married, and as unlike the slender stripling we had known at college a dozen years before as could well be imagined. He pressed us to stop over night with him or at least to come up and take supper with him; but as our costumes were hardly presentable in a lady's parlor, and as we did not deem it safe to go away and leave our canoes unprotected so close to civilization, we were obliged to decline both invitations, much to our regret, as well as Jim's.

F. R. WEBB.

Trap-Shooting.

Fixtures.

- Jan. 5.—Newark, N. J.—Tournament of East Side Gun Club; main event, match between Morley and Schortemeier for E. C. cup, and State championship.
- Jan. 10.—Brooklyn, L. I.—Brooklyn Gun Club's invitation live-bird shoot. John Wright, Manager.
- Jan. 11.—Lyndhurst, N. J.—Twenty-five live-bird handicap, \$10, birds extra; commences at 12 M. T. W. Morley, Sec'y.
- Jan. 17-20.—Hamilton, Ont.—Annual tournament and grand Canadian handicap of the Hamilton Gun Club; \$1,000 guaranteed. H. Graham, Sec'y.
- Jan. 18.—Reading, Pa.—The Reading handicap; open to all, \$10 entrance, \$150 guaranteed. Arthur A. Fink, Manager.
- Jan. 18.—Stony Creek, Pa.—Stony Creek handicap, 25 live birds. A. A. Fink, Manager, 426 Franklin St., Reading, Pa.
- Feb. 22.—Worcester, Mass.—Tournament of the Worcester Sportsmen's Club; targets. A. W. Walls, Sec'y.
- April 6-8.—Utica, N. Y.—Fulford's handicap at live birds. E. D. Fulford, Manager.
- April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament.
- April 18-20.—Lincoln, Neb.—The Lincoln Gun Club's second annual interstate tournament; targets and live birds; \$500 added. Geo. L. Carter, Sec'y.
- April 18-21.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.

DRIVERS AND TWISTERS.

The programme of the Hamilton Gun Club, Hamilton, Can., for its ninth annual tournament, which takes place Jan. 17 to 20, is an attractive one. The first day has two live-bird events, one at sparrows and three target events. Each target event is at 20 singles, \$2 entrance, one event having \$50 guaranteed. The sparrow event is at 15 birds, \$2 entrance, \$50 guaranteed. The first live-bird event is the introductory, at 10 live birds, \$5 entrance, \$100 guaranteed. The handicap is at 20 live birds, \$15 entrance, including birds; surplus added. Divided, first, \$125; second, \$85; third, \$55; fourth, \$55; fifth, \$45; sixth, seventh and eighth, \$35; each; ninth, tenth and eleventh, \$25 each; twelfth, thirteenth and fourteenth, \$15 each. The second day will be devoted to a continuation of the handicap, one event at sparrows and three at targets. On the third day there is a 10-bird event, \$5 entrance, \$100 guaranteed; one at sparrows, \$2 entrance, \$50 guaranteed, and two events at targets. On the fourth day is the open handicap, 25 live birds, \$25 entrance, four moneys, \$200 guaranteed, surplus added, high guns.

There was an excellent attendance of shooters at the Carteret Gun Club's grounds, Garden City, L. I., on Jan. 2, the main event being the New Year's cup, value \$100, and presented for competition by Mr. George B. Magoun. The conditions were miss-and-out, handicaps from 25 to 32 yds., entrance \$20. The competition was open to members of the Westminster Kennel Club, Herron Hill Gun Club, Riverton Gun Club, Philadelphia Gun Club, Country Club of Westchester, Meadowbrook Hunt Club, Rockaway Hunt Club, Washington Gun Club, of Chicago, and the Carteret Gun Club. After the 15th round, when Mr. Fred C. Moore retired, the contest continued between Messrs. Frank Hall, 25 yds., and W. S. Hoyt, 27 yds., both members of the Carteret Gun Club. The former won at the 39th round. Messrs. McAlpin and Butler retired at the 14th round; Mr. Foxhall Keene at the 10th, Mr. C. S. Guthrie at the 6th, Messrs. Eddy, Money and Sanford at the 3d, Mr. E. C. Hoyt at the 2d, Messrs. Stafford, Hooper, Thorne and Kernochan at the 1st. A sweepstake at 5 birds and a miss-and-out also were shot. E. C. Hoyt, H. Money and Moore divided the former. Sanford, Guthrie, Hall and Money divided the miss-and-out.

Mr. John S. Wright, manager of the Brooklyn Gun Club, desires that his guests note the following: "Shooting will commence at 10 A. M. sharp. There will be plenty of good birds at 25 yds. each; also luncheon—a most important item—at prices to suit. Entries will be taken and cash paid out by John D. Regan, Sec'y of the Brooklyn elevated run from the Bridge (New York side) direct to Cypress Hills. A. S. A. rules will govern all contests at this shoot. All purses divided, class shooting. Three moneys in Nos. 1 and 2; four moneys in No. 3." In contest No. 1, 5 birds, \$3, all stand at 28 yds. In No. 2, 7 birds, \$5, handicaps 28 to 31 yds., and No. 3, 10 birds, \$10, handicaps, 26 to 31 yds., will govern. Shooting will begin early; therefore the guests should endeavor to be on hand at Dexter Park, at 10 A. M., Jan. 10.

Mr. Edward Banks spent the latter part of last week on the shores of Maryland shooting ducks, and he made several of his friends additionally happy by gifts of the proceeds of his skill. On the evening of Jan. 2, after the Boiling Springs handicap, in a cosy hostelry, he gave a dinner, the main dish of which was ducks of his own killing, deliciously served. His guests were Messrs. L. G. Duff Grant and F. W. Jones, of the Smokeless Powder and Ammunition Company, of England; the veteran Uncle Jacob Pentz, and Messrs. W. R. Hobart, Harold Money and B. Waters. If the New Year continues as happily as it began for the little party, it will be quite as happy as need be.

The New Year's cup was the main object of contest at the Westminster Kennel Club's shoot on Jan. 2, at Babylon, L. I. It was a 10-bird handicap, with sixteen contestants. Messrs. G. B. Magoun and H. K. Knapp tied on 9. The latter killed 4 out of 5 to the former's 3 out of 5 in shooting off the tie, and won the cup. Two other events were shot, the first a 5-bird sweepstake, \$5, handicap. Magoun and Ferguson were the only ones to kill straight. In the miss-and-out which followed, Magoun killed 13 straight and won. His nearest competitor was W. C. Floyd-Jones, who killed 12.

The calendar of the Laffin & Rand Powder Co., 99 Cedar street, New York, for 1899, is quite unique and original. A muscular Jackie, whose cap bears the name of that giant gladiator, the Oregon, leans at ease on the muzzle of a mammoth canon, while on his right shoulder he bears a load of cannon powder. The legend "Manila, Santiago, Porto Rico," brings up memories of what good powder could and did do. Under each leaf of the calendar are wise suggestions for the thoughtful shooter to ponder over.

The Winchester Repeating Arms Co.'s calendar for 1899 is replete with pictorial suggestiveness of sport afield with rifle and shotgun. A spirited portrayal of a bear hunting scene graces the top; two hunters, rifle in hand, are stealthily approaching a bear which is in the open. At the bottom is a prairie scene in the chicken shooting season. Two setters are standing stanchly, one on point, the other backing, while the shooter, alert, and with his gun ready for instant use, approaches to flush the birds.

On the grounds of the Lyndhurst Shooting Association, on Jan. 11, commencing at 12 M., there will be a handicap at 25 live birds, \$10 entrance, birds extra at 25 cents. The grounds can be reached from New York either by the Erie R. R. to Rutherford, N. J., or D. & L. & W. to Lyndhurst, N. J. Trolley cars from Newark, Jersey City and Paterson. T. W. Morley, Sec'y-Treas.

The catalogue of the Savage Arms Co., Utica, N. Y., mailed free to those who apply for it, presents an elaborate description of the military, sporting rifles, carbines, ammunition, etc., manufactured by the company, together with a full explanation of the Savage system of mechanism, its advantages, etc., all fully illustrated with engravings of rare excellence.

The East Side Gun Club, of Newark, N. J., have now in use the set of live-bird traps formerly owned by the Carteret Gun Club and used by the latter before the removal to Garden City. The East Side's next live-bird shoot is on Jan. 26.

Mr. Gus Grief, of Von Lengerke & Detmold, returned last week from a trip in northern Dakota, where he was enjoying the big-game shooting of that region. He reports a successful outing.

According to the conditions governing the Clinton Bidwell trophy the first contest was to take place on Monday of this week. The conditions are published in full in our trap columns.

The regular monthly club shoot of the Boiling Springs Fishing and Gun Club, Rutherford, N. J., has been postponed to Saturday, Jan. 19.

Trap around Reading.

READING, Pa., Dec. 26.—The South End Gun Club, of this city, held their annual Christmas shoot to-day on the Island grounds. The principal event of the day was the medal shoot, open to club members only, in which good scores were made, especially by Jack, who broke 24 out of 25 targets, and thus won the Class A gold badge. The Class B silver badge was won by Charles Miles, president of the club, who succeeded in breaking 19 out of 25. The bronze medal, or Class C medal, was awarded to Joseph Downs, with 8 out of 25. Sweepstakes were shot before and after the club event. The attendance of club members was one of the largest for many years, there being twenty-one of the twenty-nine enrolled members present to shoot. The scores of club shoot in Class A were: Matz 19, W. Miller 16, H. Yost 11, G. Miller 17, Rhoads 17, Jack 24, Capt. Yost 22, Ball 15, Harrison 18, Gerhart 17, Thompson 13, Yeager 20.

Class B: Miles 19, Kelly 15, Farr 16, Gicker 15, Shultz 12, Hill 14, Dexter 5.
Class C: Renninger 5, Downs 8.
West Chester, Pa., Dec. 26.—This afternoon the West Chester Gun Club held a shoot at bluerock targets on the club grounds.

Phoenixville, Pa., Dec. 26.—The annual Christmas shoot of the Phoenix Gun Club was held here to-day. The following scores were made:

Event 1, championship of Phoenixville Gun Club, at 25 targets: Holman 14, Dotterer 19, Williams 19, Hodge 15, Pahlert 18, E. Buckwalter 10, Pennypacker 15, Dunlap 10, James 12, J. Erb 17, Harris 18, Bell 11.

Event 2, team shoot, at 10 live birds per man, teams of two men each, for Gen. Pike Hotel challenge cup: Dotterer 4, Hodge 3; total 7. Edward 4, Holman 6; total 10.

Pottstown, Pa., Dec. 26.—Live-bird match followed by target shooting took place to-day here on the Shuler Gun Club grounds. Oakbrook, Pa., Dec. 26.—The Oakbrook Gun Club held a target shoot to-day on the club shooting grounds at the Kurtz House.

Following the target shoot a live-bird match was shot between Hoffer and Breneiser, 10 birds, for \$5 a side, loser to pay for birds, 28 yds. rise, 50 yds. boundary: Hoffer 5, Breneiser 4. Also a target match between Hoffer and Haas, 10 targets per man, resulting: Hoffer 7, Haas 6.

Pottstown, Pa., Dec. 26.—A live-bird match followed by target the Keystone Gun Club, of Lebanon, and the Shuler Gun Club, of this place, resulted in the visitors winning the live-bird event by the score of 86 to 84 killed, and the Shuler boys victorious in the target match by the score of 150 to 132. The match was shot in the face of a rain and hailstorm, which made good shooting difficult. In the team shoot each club was represented by ten men. The scores were as follows:

Live-bird shoot, Keystone vs. Shuler, for teams of ten men each, each man shooting at 10 live birds, 28 yds. rise, 50 yds. boundary:

Keystone—Capt. Smith 10, Langdon 5, Bates 8, Reinohl 7, Bollman 9, Gruber 9, Witters 8, Trafford 10, Shoemaker 10, Zellers 10—86.

Shuler—Sheeler 7, Benner 8, Trumbauer 7, Capt. Cole 7, Yerger 9, Slonaker 9, Urner 9, H. Wien 9, Pennypacker 10—84.

Dead out of bounds: Keystone 7, Shuler 9.

The target match, Keystone vs. Shuler, teams of ten men each, each man shooting at 25 targets, over the mautagtrap:

Keystone—Trafford 17, Shoemaker 15, Witters 18, Capt. Smith

13, Zellers 9, Gruber 7, Bates 13, Bollman 10, Langdon 12, Shoe 4—118.

Shuler—Sheeler 16, Taylor 16, Trumbauer 16, Benner 19, H. Wien 17, Urner 10, Miller 15, Slonaker 16, Jenems 15, W. Wien 10—150.

Special event, 5 continuous targets, for Winchester repeating guns: Langdon 3, Miller 5.

Boyertown, Pa., Dec. 29.—The Boyertown Rod and Gun Club held their annual target tournament to-day, and a better day could not have been selected, as the sun shone brightly and there was no wind blowing, which made it very pleasant out of doors, and at least 400 spectators watched the different events during the day. The shoot was under the management of Arthur A. Fink, of Reading, who succeeded in throwing over 5,000 targets from 10 A. M. to 5 P. M., when darkness set in and stopped shooting. Two traps, set close together in a pit, were used to throw the targets, and gave entire satisfaction to all. This event was the largest shoot ever given by the Boyertown Club. The scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17
Targets:	10	10	15	10	10	10	15	15	10	10	10	10	10	10	20	10	5p

DUSTER.

East Side Gun Club.

Newark, N. J., Dec. 26.—The Christmas shoot of the East Side Gun Club was well patronized. There were nineteen who shot through the main event, the conditions of which were 15 live birds, \$5 entrance, birds extra. In events Nos. 1 and 2, 5 birds, the entrance was \$3. No. 3 was 7 birds, \$4. All stood at 28 yds.

The birds were a good lot, though the absence of any wind was an advantage to the shooters. The air was cold and bracing. Feigenspan was the only one who made a straight score in the 15-bird event, though six landed in the 14 place. Schortemeier was in good form, killing 31 out of 32, Feigenspan having a similar score. The referee was Mr. H. P. Fessenden. Scorer, J. H. W. Fleming.

Poughkeepsie Gun Club.

SOUTH MILLBROOK, N. Y., Dec. 26.—Inclosed please find scores made by members of Poughkeepsie Gun Club on Christmas Day. Each member shot at 25 single targets, unknown angles. The Poughkeepsie Gun Club has over 100 names on its roll, all members in good standing, and still there were only nine men put in an appearance to shoot for the 500 loaded shells, which were to go to the five high guns:

Perkins	1111001011111111010001111110-18
M. Spencer	011101100001011011001000-13

Ramblings in the South.

CINCINNATI, O., Dec. 26.—*Editor Forest and Stream:* I have just read a book! To a man who has been reading books of various kinds in three or four languages for the last forty years one would naturally suppose that going through one more or less could not in the end make much matter. Such, however, is not the case, for the book in question is one which will always remain in my memory as alone in its class, and so far beyond any book of same character that it stands apart, towering above all others just as Diomed, the dog who wrote it, must have stood in his day. Diomed the peerless, Diomed clearly one of the grandest and most magnificent dogs that ever lived! It was a quaint conceit of the Hon. J. S. Wise, of Richmond, Va., to originate the idea of having his own dog write a life of himself, his travels and observations, and also give so accurate, albeit most modest, sketch of his master; but, if ever a book containing as much genuine love for his cherished, faithful, glorious companion has ever appeared, then I want to read such, for one always feels kinder toward mankind at large after such occupation. There is something so genuinely real about the whole volume—so utterly and absolutely sincere—that one could as well deny the existence of Mount Hood when viewing it from afar, or the Mississippi River while standing on its bank, as doubt the bred-in-the-bone, un-failing love and admiration for each other that existed (and may still exist) between dog and master, between this genuine old-school Virginia thoroughbred sportsman and his noble companion, who “from day up to day down, week in, week out,” never faltered, forged ahead. Ouida, in “Under Two Flags,” has given us some scenes between Bertie Cecil and his horse that are in my humble opinion the greatest masterpieces of her prolific pen—scenes which appeal to any man who at one time or another of his life has felt that all in this world depended on his mount, that his horse was his only means of salvation. A plainsman and a soldier know what I mean, and as such I hope I appreciate Ouida’s magnificent tribute to the valiant high-spirited horse.

Hon. J. S. Wise, in his most touching and beautiful essay on his friend Diomed, gains absolutely nothing by comparison with any writer, so far as I know, living or dead. Still it is human nature to link ideas, thoughts or scenes one with another, and fondly review them in quiet moments when apart from the howling mob. At such times I will be the better man by contemplating both horses and dogs, patient, obedient servitors both, seeing them in their true light, as shown by those peerless writers, and ever thank them for the masterly gift of showing with true reflection what the mirror of nature would have us see! Well, I am so brim full of Diomed that I had to say something, more particularly nowadays, when one reads so much trash and gush that is such thin veneer as to be quite transparent. Children and dogs know who loves them. Sportsmen—I mean men who shoot afield for pleasure—know the genuine article, and I know all will say with me, after reading Diomed, “All hail, John Sergeant Wise! Salute!”

Well, I intended writing a short note, telling your readers something about my last Southern trip, so it is about time I commenced.

At Knoxville I had the pleasure of being with my good, warm-hearted friend Frank S. Mead, who is keeping bachelor’s hall in the old mansion, his father and mother being away in New York. Ah! what a home that is! What a peaceful, refined, elegant abode! Books, pictures, bric-a-brac, objets d’art. Books by the thousand, the most beautiful editions, and some of the rarest works. Mr. Wm. Mead, Frank’s father, dotes on books and pictures, and his fund of knowledge and lore on such is as the sea, without limit or end; and, moreover, like all really great learned men, so quiet and reserved, that it is only to his most intimate associates that he reveals the depths of his fathomless soul. What a cruel blow it was to deprive such a family of such a son as the lamented Arthur—mourned, yearned for, departed, with prime of youth and life, depriving us of an ornament, a friend, a companion. One of God’s marked and made clean-bred sportsmen! Alas! why are such called away? It was Mr. Mead, by the way, well knowing my genuine fondness for sportsmanship, who gave me Diomed, rendering me, therefore, still under more obligations. Frank is anticipating great sport this season with a dainty little 20-bore I had put up for him, and from all accounts gun and man are en rapport and quite formidable on quail, of which there are so many this year. Good luck, old boy; I wish I was with you oftener, for of such are sportsmen made.

At Memphis I found shooting matters very quiet. Ducks had not appeared in usual quantities at Wapanoca, nor on the other noted lakes near by in Arkansas. It was too early for quail shooting, and pigeons are not trapped and shot by Memphis Gun Club much before February. I had several delightful confabs with my friend J. C. Neely, Jr., Esq., a most enthusiastic sportsman and good trap shot. About the first thing we thought of was the sad death of Judge S. P. Walker, a man so thoroughly well known, loved and respected in all his State that his death comes as a rude shock to the whole community. Judge Walker was a typical cavalier of the old school—one of the Col. Newcomb style—one of those men who meet you with a smile, not only on their lips, but with an open heart and an open hand. Judge Sam P. Walker was simply idolized by the Memphis Gun Club, and his loss can never be repaired! There is no man living who can take his place! There are very few people in Memphis worth knowing who will not bear me out in what I say. Such men are so rare that when met they make an impression on one not easily effaced. And it does seem strange that, with such a job-lot of odds and ends in this world, a pack of scheming, tricky scamps, who live to a green old age, fleecing whom they may—it does seem strange that such jewels as the judge must be called away and such riff-raff remain. Who can penetrate the mysteries of an all-wise Providence? and why should we mourn those who have gone before to their long and well-earned rest?

In February the club will commence operations on pigeons, and the purveyor, Mr. Fred Schmidt, will see to it that they shoot at good birds. The Memphis Gun Club is composed of many of her very prominent men, and numbers in its ranks some excellent shots. We all know that, and we hope to see several of the best taking part in the Grand American Handicap next April.

I would like to have had a day’s quail shooting there with my friend Mr. Will Allen, but unfortunately we could not arrange it. Better luck next time, for here’s another of your clean-bred sportsmen, and one with whom it is a great pleasure to shoot. So I will lay for him on next trip sure; and if he gets away from me it won’t be my fault.

Well, I eventually struck Shreveport, La. Shreveport is the home of Sam Enders. There is just one Sam, and that is the only Enders, and that ends it. Sam was not quite sure about the ducks. He said he was right side up himself, his boat was stanch, his live decoys saucy, fat and charming as ever; his guns o. k., at least one of them was; the other—well, never mind. But the ducks were not there so thick—that is, so many. Too much water, lack of concentration, universal deluge; ducks scattered to the four winds. As the Sioux Indian would have expressed it, “Minnesota—heap water.” But we went at it under his most skillful guidance; had pretty fair shooting; bagged about 150 between us in three trials—black jacks, teal, mallards and canvasbacks, though only four or five of the latter. We were both extremely sorry that our mutual friend Mr. A. F. Jenkins, of Shreveport, could not join us. He is so busy at that season managing an immense cotton compress that he could not get away. This I particularly regret, as I feel under many obligations to him, having always shot over his decoys and used his boat and paddler.

Sam says he will have a few pintails staked out for me when next I go there, which I hope he may, as it is a real treat to double them high up in the air; they fold up so beautifully when hit center with a full-choke gun; and, I say, I have just such a gun—a 32in., that seems to shoot all sizes of shot with great force and wonderful compactness; in other words, a gun that goes about 80 per cent. of its charge in a 30in. ring at 40yds., giving beautiful distribution of its pellets, and when using say 3/4drs. best nitro powder—and that I opine is pretty good—all the same I never have had one before that would do it.

Well, I next shot at Lake Charles, La., with my old chum J. C. Elstner. We did not break any records this time, but just potted about, bagging a few quail, snipe and some doves. Mr. Charles Lyman, a most enthusiastic sportsman, very kindly took me in tow on one day, and a fine time we had of it, driving out to Mr. Nicholas’ farm and kennel, where we saw some splendid work by his dogs. Mr. Nicholas has the ways and style of a very competent dog trainer and handler, and I’m sure will turn out great dogs.

But the day we most enjoyed at Lake Charles was the one we put in prairie chicken shooting. We started out before 6 A. M., drove about fifteen miles to a certain ridge, and then let the dogs range wide, skirting the highest ridges all the time. Every now and then a point would be made, a chicken or two flushed and shot, and then the journey resumed. Joe Elstner and I took one vehicle, Messrs. Moss and Lyman going in the other. Mr.

Moss was pilot, having for many, many years shot over that ground. In the evening we had but fourteen chickens—pinnated grouse—to show, but they were all such fine, large birds, fat, sleek and in prime condition every one, and that was enough. We also picked up a few snipe en route, sundry hawks en passant, as it were, and all in all had a great day, breathing fresh air on that great Louisiana plain.

As a wind-up, I landed in New Orleans, where I found my good friends Messrs. John W. Phillips and Norvin T. Harris. With the latter I went to Baton Rouge to attend a tournament, but it rained so hard we could not shoot. However, it is a great privilege to enjoy the close companionship of such a man as Norvin Harris; so, although we did not smash any targets, which by the way, can be done at any crossroad, yet we chatted along all day, and late into the night, as men who always understand each other can, and had a sociable, quiet, good time by our lones. To thoroughly appreciate Mr. Harris, one should see him at his home at Hurstbourne Farm, Kentucky. There you have him at his best sans flub-dubs, sans fringes, sans tinsel, sans ceremonie—just a country gentleman, and who is never so happy as when dispensing hospitality with a free, open hand, lavish in its prodigality. It is a pity we can’t all know him, for some of us might with much profit and benefit take lessons from such a noble character; and every one who is honored with his acquaintance, from the highest and most exclusive Britisher to the lowliest peasant, will bear out all I have ever said about our Southern country gentleman—our Norvin, as we all love to call him.

And then I had a feast of French opera. Ah! such music! particularly such orchestration as one hears at the French Opera House. It was all a grand treat to me, so fond, so passionately fond, am I of music. With so an fait a chaperon as Mr. Phillips, one must enjoy a performance much more than one could alone. He is so brim full of reminiscence and anecdote of so many actors and actresses that there alone exists a great charm in itself. I am looking forward to February, when I hope to have both of these men accompany me on a snipe shooting trip with our host, Mr. J. C. Elstner, at Lake Charles. We will be sure of excellent food and a most hearty welcome at the Howard House by its proprietor, Mr. Pierre Theaux, and that means a good deal. Then, with my New Orleans men, and Jo to steer things, I don’t see how we can go amiss, for Jo, while he does not say much, generally lands on both feet. Well, it is only a short spell until February, yet the days drag along slowly enough.

At Louisville I no sooner landed than the irrespressible Harry Lyons climbed my collar and challenged me to shoot him at 25 pigeons, loser to pay for the birds. Well, we shot, and the scores were not good, so we will let that pass. But the birds were good enough, and we had out some of them pass too. So now in matches I think Harry may even; but I know he is laying for me when he gets his next gun.

I no sooner got home than I was attacked by the gripe, and so could not go to Indianapolis tournament, much to my chagrin. Affairs at the Cincinnati Gun Club seem to be going on as usual. One thing, however, looms up, and that is the great, steady and strong shooting of Maynard, an old-timer, with whom I used to smash Ligowsky clay pigeons fifteen to eighteen years ago at Price Hill. Maynard seems to have found the place. I only hope he may keep it. But it is an illusive grasp most of us ever fasten on the evanescent blue-rock; even when we think we have it throttled, it may glide away most serenely; and many a man has bobbed up and down so often in his scores that he has given it all up in despair. But I think Maynard will stick. He is that sort.

With very best wishes to all my friends for the coming year, and wishing them happiness, health, prosperity and peace, I subscribe myself now, as always,

GAUCHO.

Buffalo Audubon Gun Club.

BUFFALO, N. Y., Dec. 24.—Subjoined is the official score of the Burkhardt-Besser match, which was shot at Audubon Park, Thursday, Dec. 22. Mr. Besser won out, making a grand score of 93 to Burkhardt’s 59. Mr. Burkhardt was handicapped very much by the breaking of his gun on the 8th bird of the match. He had to finish with a strange gun. A noticeable fact was his ability in using the second barrel with this gun, owing to the difference in the pull between his and the one he was obliged to use. It was almost useless to him. About 500 people witnessed the match, and considerable money changed hands on the result. Immediately after the match Mr. Burkhardt challenged Mr. Besser for another match for from \$100 to \$500 per side, which in all probability will be accepted. As they have each won one match apiece, the deciding one no doubt will be a very interesting affair, and would be worth going miles to see.

Barker Talsma, referee; Wm. Daw, judge for Besser; C. J. Moyer, judge for Burkhardt; F. P. O’Leary, scorer.

Clinton Bidwell Trophy.

The conditions governing the Clinton Bidwell handicap, for the Clinton Bidwell trophy, as drafted by the committee—Messrs. Edwin N. McCarney, C. S. Burkhardt and Leonard W. Bennett—are as follows:

First—All contests must take place on grounds of the Audubon, Bison, Buffalo or Cazenovia gun clubs, holder of trophy to have the selection of grounds and name date of contests, but must name date not later than two weeks from date of challenge.

The first contest will be on the grounds of the Buffalo Audubon Club, on Jan. 2, 1899, beginning at 10 A. M. sharp, and will be at 25 live pigeons. The final contest will be on May 30, 1900, and will be held on the grounds of that one of the clubs specified which offers the largest amount of privilege of contest. Surplus money over amount paid to the holder of cup at that time to be added to sweepstake. This final contest shall be at 50 pigeons. Birds for all these contests must be furnished at 30 cents per pair, dead birds to the ground.

Second—Any resident of Buffalo, or member of any regularly organized gun club having its headquarters in Buffalo, is eligible to shoot in these contests, subject to the following conditions: The committee on arrangements has the right at any time to exclude any person or persons from entering in competition for the trophy. It shall not be required of them to make any necessary explanations or say why they wish to regard any one as not eligible.

Third—Latest revised American Association rules to govern, with the following exceptions: All contests subject to handicap rise. Black powder and 10-gauge guns barred.

Fourth—Clinton Bidwell is to name referee, providing competitors cannot agree on same.

Fifth—The amount of entrance money in open competition shall be \$10 to the sweepstake and \$3.75 for birds. All contestants in open competition must send \$3.75 to E. N. McCarney, No. 14 West Swan street, with entry. This amount represents the cost of birds, and should individuals not compete, the money will be added to sweepstake. This deposit must be made with entry at least two days prior to date of contest, in order to enable handicap committee to arrange handicaps. Post entries must pay \$1.25 extra, which will be added to the sweepstake. Balance of entrance money, \$10, may be paid on day of competition. Any person who has entered in advance for open competition must be on hand

and ready to shoot before the end of the fifth round. Should he fail to be at the score at that time, the advance entrance, \$3.75, shall be forfeited and be added to the sweepstake. Post entries allowed only up to the end of the second round.

Sixth—The cup shall go with first money. Should there be ties, the money will be divided. Ties for first place shall immediately shoot off for possession of the cup. All moneys will be divided, “class shooting,” as follows:

Three entries or less, one money.

Four to six entries, two moneys, 60 and 40 per cent.

Seven to ten entries, three moneys, 50, 30, and 20 per cent.

Eleven to fifteen entries, four moneys, 40, 30, 20 and 10 per cent.

Sixteen to twenty entries, five moneys, 30, 25, 20, 15 and 10 per cent.

Over twenty entries, six moneys, 25, 20, 17½, 15, 12½ and 10 per cent.

Seventh—Winner of cup in any contest must defend the cup within two weeks if challenged, or forfeit cup to challenger. Priority of claim of challengers to be decided by scores in opening contests. Challenges must be within twenty-four hours after last contest in order to hold right of claim to next contest. No person having once competed in match contest to have claim to another contest while others are waiting. Challenges must be sent to E. N. McCarney, No. 14 West Swan street, accompanied by \$7.50 to cover cost of birds for both contestants. Challengers must also pay to referee \$10 on day of contest, which latter amount shall go to winner.

Eighth—If there be no challenge for two weeks, any regularly organized gun club of the city of Buffalo to have the privilege of calling in the cup for open competition, under same conditions as opening contest by paying the holder of the cup \$15; privilege of challenge after that time to be awarded same as after first contest.

Ninth—In the event of circumstances preventing any contest on date named, committee to have privilege of naming another date, or awarding cup, at its discretion.

Tenth—On May 30, 1900, all who have won cup either in open competition or by challenge will be entitled to compete for final ownership; holder of cup at that time to receive the usual compensation from club wishing contest.

CHAS. J. MOYER.

Remington Gun Club.

ELION, N. Y., Dec. 27.—The Remington Gun Club held a shoot on their grounds, Dec. 26. Nine members of the Richfield Springs Gun Club attending and taking part in the programme. There were eight target and one live-bird events. Nos. 1 and 2 were the club badge shoot; Nos. 3, 4, 5, 7 and 8 were sweepstakes, 15 targets; No. 6 a team match, Remington vs. Richfield Springs, nine men on a side, 25 targets; Nos. 9 and 10, live birds. The team match was won by Remington Gun Club; score, 154 to 152.

Baltimore Shooting Association.

BALTIMORE, Md.—The weather was favorable for the Christmas shoot of the Baltimore Shooting Association. The live birds were first class.

From morning until early in the afternoon the clay target traps were used. Capt. James R. Malone, of the Shooting Association, had perfected arrangements for the shoot, with the result that the crowd of gunners and their friends found no interruption to their desire to try their luck. The chief event of the day was the 10 live-bird handicap, \$5 entrance. Fox and Johnson were the only ones to kill straight, and they divided first money.

At both targets and live birds there was uninterrupted practice, and a long string of sweepstakes and miss-and-outs were shot. Dixon and Hood shot a 10-bird race, both tying at 9 birds. Hood won the miss-and-out shoot-off, as Dixon missed his third bird. Fox, Malone, Hood and Mitchell tied in one live-bird miss-and-out, and then Hicks, Malone and Hood tied in a similar event.

The principal event with the targets was a 25-target handicap, \$1.50 entrance. The scores in this event, with the number of birds shot at, are as follows: Hood, 25, 23; Thomas, 33, 11; Starr, 26, 20; Greiner, 35, 17; Gent, 28, 20; Dixon, 33, 22; Harrison, 28, 14; Hicks, 27, 23; Malone, 25, 22.

The scores in the Christmas handicap, 10 live birds, are:

Harrison, 281110022111	8	Hood, 300221212111	9
Mitchell, 292012122100	9	Malone, 301211021112	9
Linthicum, 281002122100	6	Gent, 281011220022	7
Hicks, 301212121201	9	Starr, 280222121112	9

Dixon, 280121121111	9	Brewer, 282000120222	6
Greiner, 262010021111	7	Fox, 302211212111	10

Meyer Defeats Lane.

ROCHESTER, N. Y., Dec. 22.—Mr. Ed Meyer, of the Rochester Rod and Gun Club, was an easy winner in the match shoot with Clarence Lane, of the Hilton Gun Club, shot to-day on the grounds of the Hilton Gun Club, and was witnessed by most of the expert shots in the county. The contest was the outcome of a challenge recently issued by Lane, offering to shoot any trap expert in the county 100 targets for \$100 a side. The challenge shoot was preceded by a merchandise event, which was open to all comers.

CONVENTIONALISMS.

MR. WILMOT TOWNSEND'S record of observations at Bay Ridge of the southward flying birds is of peculiar interest, because it exhibits the resources even of the city for natural history study, if only one have for this the bent and the intelligence. Bay Ridge is a part of Greater New York. It lies on a high ridge, as the name imports, whose bold bluff faces New York Harbor and overlooks the Bay to Staten Island and the Jersey shore. It is directly in the line of migration, and gives rich opportunities for study of bird life, how rich and varied Mr. Townsend's record printed to-day and other recent notes from his pen amply attest.

There is a generally accepted conventionalism which deprecates the lot of the city dweller as of one shut off from nature, and those phenomena of earth and air and sky which are supposed to belong exclusively to the privileges enjoyed by those who live in the country. But as a matter of fact the case is quite contrary. Nature in its beauty and glory, with its ever varying moods to engage the attention and divert the mind, and with its influences to depress the spirit or exalt the soul, may be as real, as ever present and as potent in the city, and as much a part of one's life there, as in the remotest wilderness. Indeed, with some whose daily round is in the town, nature—the trees, the clouds, the sky, the tints and tones of the atmosphere, the mist and the haze, the sunlight, the storm, the lightning and the thunder flash, the enshrouding fog, the snowflake and the ice crystal, every phenomenon of the changing seasons—is as well noted and as powerful to excite the same emotions as with one whose surroundings are wholly rural. For him of the town and for him of the country there is, after all, practically the same outdoor world if one have the eye to behold it, the ear to hear it and the nostril to inhale it. The grander phenomena of the succession of day and night—the melting of darkness into the soft gray of the morning, the rosy flushing of the clouds, the lighting up of the eastern heavens, and the majesty of the rising sun—may quicken the heartbeat and the breathing of one hurrying from city home to city task, and give inspiration and mean as much to him all through his day as it does to the dweller in the country who goes the round of chores by lantern light on the farm. As with the coming of day so with its going. A sunset is so transcendent that it matters little whether he who regards it looks out from city windows or from country hill crest. And as for the moon, if you would know the majesty of the lunar orb watch from the windows of FOREST AND STREAM its climbing of the eastern heavens above the silhouette of the great buildings and the mysterious city spread out below. Or, standing on Fifth avenue, opposite St. Patrick's Cathedral, look straight up beyond the lofty spires to the scudding clouds with the moon bursting out now and again through the rifts, and let imagination picture in the apparent movement—not of the clouds, but of the spires and the cathedral and the earth itself—the revolution of the

globe upon its axis. Or again, looking west through a cross-town street, get glimpse of the moon as dipping on the horizon formed by the Palisades it broadens and expands until the sphere fills the full width of the street from house to house. In the country one may watch the moon descend behind the mountain top, or at sea sink into the ocean; but neither of these spectacles so effectually enlarges the disc and brings it close to earth as a sister orb.

As for the minor and simpler things of nature, it would be a mistake to assume that the city dweller has not his share in these two. The trees in city streets and parks perhaps are few, but one may note the swelling bud and the unfolding leaf of springtime, the full foliage of summer, the changing tints of autumn, and the naked limbs and fretted tracery of branch and twig against the winter sky. The city man does see and note these things. They make a part of his life, and in his way and with his restricted opportunities (if any one will have it so) he gets as much and more out of nature than does many a brother in the country. And if there are those who have no eyes for nature in town, it is because they will not see; like that old man who goes scuttling along the gutters of downtown streets gathering bits of tin foil for a living, their attention is concentrated on something else.

There is another conventionalism, perhaps as widely accepted, which assumes that whenever a person goes camping or fishing or shooting he is bent on communion with nature and on looking "through Nature up to Nature's God." Sometimes he may be and sometimes not. When an enthusiastic camp-hunter talks about communion with nature, and lets on that his method is to strap a jack-light to his head, load up the old gun with buckshot, and go prowling through the brush trying to shine the eyes of a buck, the correct diagnosis of his case is that he is impelled not so much by fancied necessity of communion with nature as by a hankering after deer meat. "The depths of forests, the summits of hills, make not a man blessed, if he have not with him a solitude of the mind, a Sabbath of the heart, a calm of conscience and inward aspirations," wrote Ivo de Chartres of the anchorites and hermits of his day; and the words have a certain applicability to your fire-hunter and what he calls his communion with nature.

CONGRESS AND THE BIRDS.

As reported in another column, by courtesy of Mr. Fred Irland, Mr. Lacey's bill, to enlarge the scope of the National Fish Commission so that it shall include game interests, was adopted by the Senate on Jan. 7. It had previously been passed by the House. The Senate incorporated with it Senator Hoar's bill, previously approved, for the protection of birds by prohibiting their introduction into the United States for ornamental purposes, and forbidding their transportation between the States. The Lacey bill, as amended by the incorporation of the Hoar bill, was sent to a conference committee of Senate and House; and there is reason to believe that it will find approval.

The section of the new bill which relates to transportation reads as follows:

"Sec. — That the transportation of birds, feathers, or parts of birds, to be used or sold, from any State or Territory of the United States to or through any other State or Territory of the United States is hereby prohibited. Whoever shall violate the provisions of this section shall, upon conviction in the district where the offense shall have been committed, be punished for each such offense by a fine of \$50."

This wording is so general in terms as manifestly to include game birds; and the question arises whether, in event of the enactment of the law, it would be held to forbid the transportation between the States of game birds. If such a prohibition extended only to game birds shipped for traffic, there could be no objection to it; but the clause, "the transportation of birds to be used," goes beyond the sale provision, and if upheld as constitutional by the courts would prevent the sportsman from carrying home his game. We refer to the constitutional aspect of the question, since the United States Supreme Court has held that the regulation of the export of game is something which belongs to the individual State concerned as a part of its police power. In certain States it is expressly provided, as in Wisconsin, that persons may take limited quantities of game birds out of the State. In this the Na-

tional law and the State law would clash; and according to the Supreme Court the State law would prevail. We infer, however, that Senator Hoar has considered the proposed law in its relation to State laws and its bearing on game protective interests in general; and we assume that it is not his intention to cut off from the legitimate sportsman the privilege of bringing home his birds.

GAME PROTECTION A PUBLIC CONCERN.

MR. E. C. FARRINGTON, Secretary of the Maine Sportsman's Association, in his report to that organization urges that a license fee shall be exacted of big game hunters, \$2 for citizens and \$5 for non-residents. He gets at the justification of this measure by a very curious course of reasoning, which is to the effect that as only a small number of the citizens of the State hunt large game, the people of the State at large should not be called upon to support game protection for the benefit of the few. Mr. Farrington finds that a larger proportion of the citizens of Maine indulge in fishing, and reap advantage from angling interests. But no one can pretend that all tax-payers are fishermen or are immediately concerned with fishing. To be logical, then, the advocate of special taxation of big game hunters should extend his system to a special tax for the larger but nevertheless limited class of fishermen. Indeed, if a scheme of taxation is to be developed on these lines, it cannot logically be restricted to hunting and fishing, but must extend to all the other varied interests and privileges enjoyed by "classes." It is mistaken and futile to endeavor to set the citizens of a State who hunt and fish apart in a class by themselves as having interests distinct from those of the people at large. If Maine's fish should be protected, as Mr. Farrington rightly says, by the public, game protection should have support in the same source and for precisely the same reasons. One interest is in principle just as much a public concern as is the other. We are not now dealing with the question of the desirability of a game license system as a protective measure or as an expedient for raising revenue; we are simply pointing out the untenable ground upon which this Maine license is suggested. The game is a resource of the State, and of the whole State; as such it should be protected by the State and by the whole State.

SNAP SHOTS.

It is not yet too late for New Year's resolutions, if the resolves be of a practicable and practical nature. Let us all then take a solemn vow not to transmit money to publishers for books or papers unless we sign our names to the letter so that the recipient shall know to whom to send the things ordered. We owe it to ourselves always thus to add the address essential to our getting what we pay for; and quite as much do we owe it to the publisher so that he may send the things paid for, and not incur the bad opinion which we must have of him in default of receiving something for our money. The Forest and Stream Publishing Company is at this moment holding various sums of money sent to it for books and subscriptions by correspondents who neglected to sign their names. In some cases, by sending the letters back to the local postmaster and asking him to identify the writing, the sender has been discovered, and his wants filled; but this is not always successful. No doubt some of these careless folks are thinking hard thoughts of the publishers when the fault is entirely their own—whoever they may be.

The report of the Maine Fish and Game Commission this year is illustrated with plates of moose, caribou and deer. The portraits have the merit of originality and novelty; and doubtless are intended to be taken as accurate and official representations of Maine game. They do not, however, represent the several species familiar to the hunter as inhabiting the game country. Indeed, one who was fortified with the report might kill game out of season, and when brought to book, prove by these official pictures of moose, caribou and deer that the animal he had killed was none of these; and on this evidence the court would not fail to acquit him.

The Amateur Photography Competition report will be given in an early issue.

The Sportsman Tourist.

Yukon Notes.

FROM the 7th to the 17th of November, 1897, McKercher and I occupied a cabin at Fort Selkirk, and busied ourselves searching for two of the lost boats which still remained to be accounted for. Mr. Pitts gave us the use of the best cabin at the post, which was provided with a good cast iron cook stove, and he would accept no rent in return. Knowing the great scarcity of food in Dawson, the agent anticipated a great rush of refugees out on the ice as soon as the Yukon closed, and he stipulated that when this occurred, if we were still at Selkirk, we should exchange our cabin for a smaller one, then used as a storehouse.

Mr. Pitts also stipulated that we should provide our own firewood. Firewood is scarce around Fort Selkirk, and is best secured in the summer time by rafting it down from the islands above. In winter one has to go a mile or more to get anything at all, and the best wood is not found short of a distance of two miles.

Mac and I took turns getting the wood. We laid out a snowshoe trail with easy curves and the best obtainable grades across the plateau back of the post to the nearest spruce forest. All the dead wood near the outskirts had been cut, and we had to go into the timber a considerable distance before we found anything fit to burn. A little clump of dead pines, 6in. in diameter and 30ft. or so in height, was a bonanza. The wood was resinous, and though it burned quickly, it made an elegant hot fire while it lasted.

Our time was chiefly occupied in the search for the lost boats. We traveled up river and down for miles, and spent much time fruitlessly in running to ground rumors originated by enterprising Indians.

We had posted a reward of \$25 for information which would lead to the recovery of the boats, and while none of the Indians really took the trouble to look for them, all were perfectly ready to earn the \$25, provided they could do so without inconvenience to themselves. It may have been that they relied on second sight, or that their medicine man went into trances to locate the whereabouts of the boats, or it may have been simply that the wily tan or black brothers hoped, by a lucky gamble, to guess the information that would bring them the silver. Be that as it may, the Indians were prolific in furnishing positive evidence that cost us much trouble and loss of patience to investigate and prove false.

On one occasion we beat a snowshoe trail and hauled a boat on a sled three miles through the woods to reach a point up river opposite an island, on which an Indian was positive he had seen white men in the act of removing supplies from one of our boats. There hadn't been enough new snow to obliterate man's footprints, and we were able to prove the Indian an unmitigated liar. Afterward, when this same gentleman came to our cabin with his hand on his stomach and the "no-muck muck-fraid-poor-Indian-die" story on his lips, we experienced less regret than usual in refusing food.

Like other aborigines, these Selkirk Indians are thoroughly unreliable. They are not as yet, however, affected to any great extent with the vices of the outside world. Some of the Indians have more wives than is considered proper in the best circles, and their code of morals as regards the sexes is about as low as one might expect, but we saw no very flagrant cases of immorality, and still more remarkable, we never saw a drunken Indian. We once saw whisky offered to Indians, but no one of them bit at the bait. Instead, the spokesman shook his head and said, "No good for Indian." Several years ago there was a Church of England missionary at this place, and the refusal, no doubt, was a result of his teaching. It is sad to contemplate the almost inevitable certainty that his work will be undone. There are practically no restrictions on the liquor traffic in the unorganized northwest territories of Canada, and the time has come when the man who has whisky to sell will set to work to cultivate in the Indians the taste for it.

Frozen Patches on a Leaky Boat.

The day after our arrival at Selkirk was memorable for an experience with robbers. Mac and I went up to the cache at Wolverine Creek and packed the articles we had left there in the boat we had saved from the ice jam with a view of conveying the things to Selkirk and also at the same time making a closer examination of some of the river bars on which it seemed the lost boats might have stranded.

Before launching the boat we took an axe and chopped off a portion of the thick ice with which the bottom was covered. In doing this a miss stroke was made and the axe cut clear through the canvas covering of the boat below the water line. We looked at the boat and then at each other. It was a slow job patching by the usual process, for it involved building a fire to thaw out the canvas so that an awl or needle would go through, and the thing had to be done just right or there would be trouble.

Finally Mac brightened. "How would it do to freeze a patch on it?" he suggested. The idea would have been ridiculous anywhere else than on the Yukon. There it was the acme of good logic. The temperature of the water was below the freezing point, and objects immersed collected ice in a way diametrically opposed to facts as commonly observed.

The outside of the boat was too rough with ice splinters to apply the patch, so it had to be put on the inside, where the pressure of the water would have all the greater chance to displace it. We were confident, however, that our plan was a good one.

The patch was pressed close against the cut and held in position by two wooden splints inserted behind the longitudinal ribs, and a dash of water thrown against it served to seal the edges. When the boat was launched a covering of ice formed instantly on the outer side, and the patch required no further attention.

There was much less ice in the river than for several days past, and it seemed the cruellest irony of fate that we could not take advantage of the opportunity to continue our trip down the river.

We were, of course, unaware of the fact that the Yukon was then closed at Dawson, and that the jammed ice was

backing up toward us at the rate of twenty miles a day. A cake of ice, floating unimpeded with the current, will run five or six times that far in a day. This means that it takes on an average five or six cakes of 20in. ice piled on top of each other, or pushed up on edge out of the water to form a barrier capable of holding back the rush of ice above. No wonder when the river stops its surface is a jagged panoply of broken stratas, and that the walking is the worst that weary man ever dragged his bones over.

Cold-Blooded Robbers.

We pushed off with Mac at the oars, and aided by the setting pole with which I was provided, were able to work our way laboriously among the ice cakes. The current hurried us along and in an hour and a half from the time of starting we came in sight of the network of bars, on one of which we had left the boat recovered the day before. Just then an Indian appeared on the shore waving his arms excitedly. He called out something in which we caught the words, "white men" and "steal," and following the direction of his gesture we saw, with a sudden sinking of the heart, that this time there was no guesswork about the information. A large boat was drawn up in a little cove just below the point, and near by was our boat. Several men could be seen carrying bundles on their shoulders to the large boat, and it required no second glance to tell us we were being robbed.

As the quickest way of reaching the spot, we ran our boat up on the nearest bar, and I waded across to the cove where the strange boat was. The men did not seem at all ashamed to be caught red handed, and I have no doubt their easy assurance was strengthened by the fact that there were four of them, each provided with a revolver of heavy caliber, while we were unarmed.

They said they had found the provisions and proposed to keep them, and that might have been right. The things in the boat were worth a good many hundred dollars, as prices ran on the Yukon last winter, and the thieves knew the booty was worth fighting for.

I told them the boat contained every pound of provisions we had in the world, and that if they took the food we should starve. "Starve and be damned," was the reply.

Under the circumstances it wasn't worth while to waste time arguing with words. Guns had the call in the game, and no other argument remained. I turned abruptly, waded ashore without interference, and set off on the run for our cabin. There I knew I could find an argument that would match theirs.

When I struck the snowshoe trail used by the Indians hauling wood, I looked back and saw that the men were tracking their boat up against the current in an effort to get her around the bars and into the main channel of the river. I felt sure they could not succeed against the downpouring flood of ice, and if they failed I should have no difficulty in heading them off when they attempted to pass Fort Selkirk in the inner channel, which was scarcely more than 100ft. wide, and ran close in under the bank.

When I reached the cabin I began searching for Mac's rifle, but to my dismay I could not find it. I kicked over the few articles of furniture which the room contained, scattered the bedding and upset the provision sacks, but nowhere could I find the gun. Finally, by the merest accident, I kicked the baseboard at one side of the cabin; it fell forward, and there was the rifle where Mac had hidden it for fear the Indians would steal it.

I caught up the gun with a handful of cartridges, dashed out the door and up the trail. The boat had not yet passed—that much was certain.

Our Argument Prevails.

It was late in the day and fast growing dark, and no doubt the robbers had come to the conclusion that it would be safest to wait till after nightfall to pass the collection of cabins they could see on the bank below.

Fortune favored us in more ways than one. When I got back to the cove the party had separated, and only two were in the boat. The others had probably gone ashore for a reconnoissance. The men in the boat were looking out in the river intently watching Mac, who was working his way toward them in the eddy of a sand bar. If the thing had been planned it couldn't have been better arranged, and I had no difficulty in wading out and getting the drop on the men.

I was so angry with bottled up indignation I could scarcely speak, but I managed to impress upon the men the necessity of sitting still. I wanted in the worst kind of a way an excuse for shooting, but they offered no resistance. They sat there with their hands on their knees looking straight ahead like graven images, and they did not even open their lips.

Back on the Skagway trail the subject of punishment to be meted out to thieves had often been discussed, and the majority of men who expressed an opinion had said they would shoot in their tracks any one caught tampering with their supplies. I had never been able to agree with this view of the case, for robbery seemed a trivial offense compared with a human life. Now I realized that circumstances alter cases.

Here were four strong, able-bodied men with plenty of provisions of their own turning to and without the slightest compunction robbing two poor devils of their all. The meanness of the thing was galling, and particularly so seeing it was our ox that was gored.

Mac came over and began taking out of the boat the things bearing our names. It occurred to me that the other men might return and pot us in the back, and after that I kept one eye on the shore. We were not molested, however, in the work, and Mac had gotten everything safely ashore and piled up on the bank before we sighted them coming back.

These men were much more voluble than the others. When they discovered the turn affairs had taken, hell broke loose in the torrent of profanity that fell from their lips. They swore at first more at the men in the boat than us, wanting to know why they had let the things be taken from them.

Their partners replied very meekly that they were not responsible—that a man was holding a gun on them at that moment and that they were in peril of their lives.

The newcomers looked over at me, and realizing that at any but the very shortest ranges a rifle is a more conclusive argument than a pistol, they waded out and got in their boat. As they pushed off into the darkness they

called back: "Wait till we catch you down the river. A man that's had the drop on him never forgets."

"Yes, you'll be glad to see us," said Mac, nonchalantly. "Dawson's a hot place for thieves, and when we meet again it'll be at a necktie party organized for your benefit. Man! man! Ye'll make a lovely picture treading in the air."

Other Robberies.

Our experience was nothing out of the common. We heard of half a dozen wholesale robberies, of which the following are samples: Three stowaways on the Rosalie who were put to shoveling coal to pay their passage from Alaska to Seattle had gone in over Chilcoot a short time before with unusually complete outfits. They left their cabin unguarded while on a trip up to Juneau, and on their return found the place gutted and not an article of the slightest value left behind.

Just before we started from Bennett we saw a good deal of a Hudson's Bay man named Cameron. Cameron had earned an outfit which included a year's supply of provisions by the hardest kind of work packing on his back, and earning by his great strength and endurance as high as \$25 a day.

When we came out we ran across Cameron at Sheep Camp. I told him I thought he was in Dawson City. "I should have been," said the poor fellow, "for I was ready to start before you were, but just as I had everything cached at Lake Bennett somebody come along in the night and stole the entire outfit. Here I am stranded at the start, as you might say, with nothing to show for a year's work but a lame back and a broken constitution."

J. B. BURNHAM.

Belvidere.

ALL summer long the spell of the mountains had been growing stronger upon us, until at last we could no longer resist their invitation to climb. The decisive moment came one evening while the Professor and the Lawyer were seated on the veranda of our little boarding house, in that reminiscent and imaginative frame of mind produced by a good dinner. The conversation turned on mountain climbing, and naturally, for green summits lay all about us, conspicuous in the clear Vermont air. The Lawyer had recently "done" a few minor peaks in Switzerland and the Tyrol, and several months of constant devotion to the law had filled him with a desire for loftier things once more. It was he who remarked at length, "Why not try one of these peaks?" And truly, why not? The Professor was at once seized with the spirit of adventure, and by the time I appeared the project had taken such definite shape that they were already at work making out a list of the necessities for a two days' trip, including a night on the mountain. For even the peak had been selected. Almost directly to the north of the little lake, by whose shores we were, and within easy driving distance, Belvidere lifted his graceful head, not so high as Mansfield, to the south, or Jay Peak, still further north, but a mountain more symmetrical and more beautiful of outline than either. Comparative obscurity added to his charm, for we knew that we should have him entirely to ourselves.

It was our plan to drive to the foot of the mountain, leave our team, and spend the night upon the summit, returning the next day. The Professor at once sallied forth to engage a satisfactory vehicle, while the Lawyer and I, by the aid of our list, collected the necessary "duffle" in preparation for an early start. We tried to exclude all but the essentials, and even then we found that we had an average of some 20lbs. to the man. The evening passed merrily amid these preparations, and after making some arrangements with the cook about the important item of provisions we retired early.

The sun rose clear on the following day, and our team was early at the door. After a substantial breakfast it required but a few moments to stow our chattels and ourselves in the roomy buggy and to drive away amid many good-byes and much waving of handkerchiefs. Vermont is not an easy country for a horse, especially if he has to draw three fairly heavy men, and ours, though a willing animal, was soon inclined to take matters easily. In this we humored him, for we were in no hurry, and we would descend two at a time on almost every hill, thus lightening his load and at the same time stretching our own legs a bit.

We had started for the mountain with no information as to how we might reach the summit, but this uncertainty only added to our pleasure. We enjoyed inquiring our way to the top of Belvidere. A mountain, like most important things in this world, possesses what may be called circles of influence, and it is one of the interesting things about such a trip as ours to note the gradual but inevitable way in which the information about one's objective point converges upon that point as one approaches nearer and nearer. The first village at which we stopped was clearly in the outermost circle. Two of the three men whom we questioned knew nothing about the mountain, although it was in plain sight; a third knew only that it could be approached from the village of Eden Mills. And so for a time we ceased asking about the mountain and inquired the best road to Eden Mills. Another five miles and we met a man who had heard that the mountain could be climbed, and shortly afterward a second, who had heard where the path could be found. We were evidently getting "warm." Finally, not far from Eden, we fell in with a man who had actually climbed the mountain. "Oh, yes," said he, switching the flies from his horse as he spoke, "there is a sorter path part of the way, but it's a pretty stiff climb. The best way to go is by Tucker's Mill, out beyond Eden; and say—when you get up there, I'd like to have you look at that spring on the top and tell me the reason of it. I don't see how water can flow out of the top of a mountain like that." We promised, and moved on our way rejoicing.

For some time the peak itself had been hidden by intervening spurs, but after mounting a tremendous hill a mile or two from Eden it loomed suddenly on our view with the little village nestling apparently at its very base. Though five or six miles away, the mountain seemed so near that a drive of fifteen minutes would take us to it; but a number of steep hills had to be surmounted first—for Vermont roads have a habit of going over instead of around the hills—and the fifteen minutes were stretched into a full hour before we reached

Tucker's, a lumbering station at the very base of the peak. From this point radiated a network of lumber roads, many of which extended far up into the dense forest on the high shoulders of the mountain. At Tucker's we found a comfortable stable for our weary horse, and after a hearty lunch, washed down with cool spring water, we set about preparing our burdens for the upward tramp. Each had two blankets (rubber and woolen), a sweater, and his share of the provisions and cooking utensils. Finding milk obtainable at the house near the mill, we procured a bottleful, although such a luxury was really unnecessary. Water was likely to prove the most necessary thing on the summit, and we carried an empty pail, which we intended to fill at the highest point on the mountain where good water was to be found, for we were skeptical as to the existence of the spring, about which our friend of the morning had spoken, on or very near the summit. Our methods of arranging the packs were marked by individuality. The Professor slung his across his back by a trunk strap. I attached mine to the axe and swung that instrument over my shoulder, much to the later discomfort of the shoulder. The Lawyer was more scientific, and arranged his blankets in the regulation army roll, so that they passed over his left shoulder and met beneath his right arm.

Thus equipped, we started forth, like a trio of campaigners, up the steep, half-obliterated lumber road, through the fragrant woods. We had started at 2 o'clock and had estimated that it would require three hours to reach the summit, a calculation which proved almost exactly right. It required but a few minutes to start the sweat pouring from our bodies, in spite of the coolness of the woods. The packs, too, increased steadily in weight, so that halts were called not infrequently, for we were not out to break a record. But despite the hard work, we still had breath enough for conversation, and now and then a burst of poetry, for there is a quality about a virgin forest that causes one to recall—yes, and repeat—all the moving verse he knows. It is the subtle power of nature working on minds ordinarily removed from her influence. Let that man whose system is stale from much work in one of the many prisons so common among the dwellers in cities hie himself to the country and climb a mountain three-quarters of a mile high, if he wishes to purge himself of all the poisonous elements of mind or body. There is no medicine like it.

The loss of so much liquid through our pores produced a corresponding thirst which we were glad to slake at each of the sparkling brooks that crossed our path. We kept bearing off in the general direction of the summit, as we had marked it by the compass, bent on following the wood roads as long as they would serve us. At last, when occasional glimpses of the valley told us that we were getting pretty well up, our particular road began to lead in an unsatisfactory direction, and we held a council of war, the result of which was a determination to strike directly up the side of the mountain. There is one simple recipe for climbing such a peak: Keep going up and you are sure to reach the summit. We advanced, maintaining considerable intervals, so that if there should be a possible trail we might run a better chance of striking it. And here began our hardest work, for our progress was barred by thick underbrush, fallen trees and boulders, and was necessarily very slow, hampered as we were by our unwieldy packs. It was breathless work. Sometimes one of us would fall, but the ground was so well carpeted with moss and creepers that no bruises resulted. Soon we saw by the more stunted appearance of the trees that we were nearing the summit. And here I may remark that the growth on Belvidere is much more sturdy than that on Mansfield, perhaps owing to lower altitude, but more likely to better soil, for I have been on many mountains not nearly so high, on which there was scarcely any vegetation for some distance below the summit. Belvidere has some respectable trees on the very summit, while the Dome of the Berkshires, for instance, a mountain far to the south and probably over 1,000ft. lower, has nothing but dwarf evergreens and a few scraggy birches. This feature of the mountain rather discouraged us, for it caused us to think the summit more distant than it really was. At last, after half an hour of hard scrambling, the Professor and I, who happened to be near together, reached a sort of shoulder of the mountain, where we paused to reconnoiter. While we were speculating as to the shortest way to the summit, we heard a shout of triumph from the Lawyer away to our left. We shouted an answer, and knowing that he was nearing the goal, set off without a thought of weariness. We fairly raced through the brush, and in a few minutes reached the point where he stood, fanning himself with his hat and absorbing the magnificent view to the east afforded by a break in the tree. There is always a point in the way up such a peak at which one is pretty firmly convinced that it is hardly worth while to work so hard for a mere view, and half decides that the valleys are beautiful enough for him, but all such faint-hearted weaknesses are forgotten as soon as he stands upon the summit and surveys with a sense of victory the beauty which his perseverance has enabled him to behold. Just so in life—but I will not moralize.

We found the summit, which might have been 70 or 80yds. in length by 30 extreme width, well wooded, except on the south, where ledges of rock prevented vegetation, and allowed an unimpeded view in every direction save the north. And what a view! Belvidere, thou art well named! Hardly anything after all can excel New England scenery for well-balanced loveliness. There are many grander prospects, but none more satisfying in their beauty than those commanded by scores of New England mountain peaks. To the east lay the network of Vermont meadow, forest and hill, with the dim forms of the White Hills for a background; to the south and north, billow on billow of the Green Mountains dominated by the huge bulk of Mansfield; to the west more Vermont meadows and the sheen of Lake Champlain, backed by the clustered peaks of the Adirondacks. And over all spread the beauty of sunlight and cloud and sky, while about us was that peculiar, peaceful stillness that dwells on mountain summits.

On the borders of the ledge we kindled our fire, and while the Lawyer tended it and the Professor gathered material for a balsam bed, I scouted unsuccessfully for the spring of which our friend of the morning had told us. My search was far from thorough, and it may be that I missed it. I was encouraged in my quest by the recollec-

tion of the well-known spring only a few yards below the summit of Whiteface in the Adirondacks, at the top of the slide which gives the mountain its name, and of which this trickling water was doubtless the cause. At length, however, I gave up the search and aided the Professor in his bed-making beneath the boughs of some protecting firs. When we had constructed a large, even pile of balsam twigs we spread over it our rubber blankets and our bed was ready for us. We had scarcely finished the work when our friend called us out to watch the shadow of the peak retreating across the valley. The sun was fast nearing the horizon, and threw the silhouette of our mountain far out over the eastern valley. There we could mark it as it crept steadily on, a huge cone of shade, up the sunlit slopes, until the sinking sun left all alike in shadow.

Not one of us was an adept in the art of cooking, and I will not relate all our tribulations in the preparation of supper. Once the wood shifted beneath a pan of salt pork, which was just getting browned to a turn, and tilted it so that the flames lit the pork and a conflagration ensued. I seized the pan and made a vain effort to extinguish the flames, but succeeded only in getting some hot fat on my fingers. Then came a war dance in which by dint of much hopping about on one foot and violent blowing on my fingers, I restored them to their normal state of feeling. I am afraid that the other two enjoyed the dance more than they regretted the loss of the pork! Suffice it to say that, though the potatoes were slightly scorched, and the fried eggs were not things of beauty to the eye, the requisite taste was there, and more important still, the supply held out. And after our climb our appetites were ready for anything. Supper over and the tin plates scoured with paper, for our supply of water was too precious to waste, we settled about the fire, pipes lit, and enjoyed such a chat as only congenial spirits about a camp-fire can enjoy, while far below in the valley twinkled the lights of numberless villages and farms, and about us sighed the cool night wind. Such an evening was well worth the toils of the day, but, enjoyable as it was, we could not prolong it indefinitely, for it was our purpose to be up in time for the sunrise. And so at about 10 o'clock we turned in.

During the afternoon a few drops of rain had fallen, but the wind had shifted to the north and everything promised a fine night. Our bed proved surprisingly comfortable, and the night was so mild that there was no fear lest our supply of clothing prove insufficient. At first, indeed, I was uncomfortably warm. We drew lots as a convenient way to decide our positions. The Professor drew the center, and after he had comfortably settled his 6ft. and more of length the Lawyer and I anchored ourselves on either side. How delicious it was to lie there on those fragrant boughs, above us a canopy of dark evergreens through whose branches the white stars gleamed and disappeared amid the scudding clouds, listening to that indescribably mysterious sound, the murmuring of the wind through the firs. Now it would sink to a whisper, again gradually increasing it would rise to a moan. To me it is one of the most fascinating sounds in nature. Once during the night I was aroused by a few drops of rain, which fell on my face from a passing cloud. I started up on my elbow, but the brilliant moonlight, which almost immediately flooded the mountain, reassured me, and I dozed off once more. The next time I awoke I felt that inexpressible change in the night which betokens the coming of the dawn. The Lawyer, too, was awake, but in a whispered dialogue over the body of the Professor, who was making the woods resound with his snores, we agreed that it would be still some time before sunrise, and so lay down again. Soon, however, the decided increase in the grayness warned us that the sun was coming. We aroused the Professor, and walking out upon the ledges whence an unimpeded view of the east could be had, it was our lot to behold the finest sunrise I have ever seen, although I have witnessed several from such vantage points. There were just the right elements of mist and cloud, and for a long time we were treated to a gorgeous display of changing color.

When the sun was fairly up we set about the preparation of breakfast. Our bill of fare included coffee, eggs, fried potatoes, sandwiches, and one or two minor items. We packed them all away with immense gusto. Such a meal naturally produced a disinclination to immediate action, and for the better part of an hour we lolled about, taking parting glimpses of the view and lazily making ready our packs for the descent. The success of the Lawyer's army roll as a method of carrying blankets had converted both the Professor and myself, and we adopted it now with great subsequent relief to our bruised shoulders. At about 8 o'clock all was ready. On the ascent we had purposely followed a roundabout course in order to avoid the steeper pitches of the mountain. For this there was now no occasion, and we determined to strike almost directly down the side of the mountain toward our starting point at Tucker's.

So down we scrambled, slipping and falling through the dense bushes and over the mossy boulders. Soon, by means of the half-obliterated "blazes" on the trees, we discovered the semblance of an ancient trail. The marks led in the desired direction, and we followed them for some time toward a large clearing of which we could catch occasional glimpses far below. From this clearing we knew that we should find a lumber road leading down the mountain. But it required still three-quarters of an hour's hard work before we reached the clearing. Close to its upper edge, where we emerged, we found a delicious spring in which we fairly wallowed with delight, for we had tasted no fresh water since the preceding afternoon. We needed all the refreshment it afforded, however, for immediately after resuming our march we found ourselves in an inextricable tangle of dead limbs, useless logs, blackberry bushes, and in fact all the refuse of a deserted lumbering camp, which is the most untidy spot on earth. "It only needs the zip of Mausers," said the Professor, up to his neck in brush, "to make us fancy ourselves in some Cuban chaparral"; and he spoke the truth. Cuban jungles, though differing in vegetation, can scarcely be more impenetrable. And there is likewise no hotter place than a clearing in the woods, where the dead brush is thick and the sun pours down on one's defenseless head, while the taller trees about shut off any possible breeze. We struggled through at last and halted in the shade of one of the lumbermen's

huts to cool off a bit. We were now at the lower edge of the clearing, and the rest of our tramp was performed by easy stages down the cool forest road to Tucker's, where we arrived at about 10 o'clock.

Of our homeward drive little need be said. The hills were generally in our favor, and our steady course was broken only by a halt for lunch beside a clear trout stream. At about 3 o'clock in the afternoon we drove up to the door of our summer home, with the conviction that our trip had been a complete success. In Belvidere we had made a friend worth knowing, and we promised ourselves that another season should see us again his guests, should the fates allow.

A. L. W.

Just About a Boy.—XV.

THE day came when the snows were melted and the river ran bank full with a murky flood. The south wind was full of the earthy smell of spring, and robins and bluebirds flitted up out of the sunny lands below the southern horizon. There is something about the awakening of a new summer that makes men restless, so I was not surprised when the boy burst into the workshop like a runaway cyclone and said, "Say, gee!"

"What is the matter, now?" I asked.

"Less git ready 'n' go t' th' mountains. I'm juss dyin' to git out o' this old flat country. Gee! I feel 's if I c'd climb forty mile to-day. Whut's th' use o' us foolin' away our time here—less git th' outfit together 'n' git a hike on us!"

"Now, see here, son," I answered, "you just use a little horse sense and see where you would come out if you started to-day. You know grass won't be big enough for horses to feed for a month yet, and up there your horses have got to have grass, because you cannot carry feed all over a thousand miles of wilderness for them. Savvy?"

"Yep. Less git things ready, anyhow, 'n' start juss 's soon 's ever we can. You tinker up th' wagon 'n' I'll git th' campin' part o' th' outfit in shape, nen we'll have the whole thing ready soss t' leave 'bout th' first o' May—whut d' yeh say?"

"Well, that will do. Suppose we use the shop for a headquarters and bring all the outfit here. You can come here and we can talk things over and decide on any point that may happen to be in doubt, so that when we start we won't have to come back for anything."

"That's a go, then. I'll go 'n' overhaul all th' stuff I got 'n' see what we want to take, 'n' what we don't. I'll fetch 'em in as I come. Goodby; I'm goin'."

Then came thirty days of suppressed excitement and anticipation for the boy, and at last it was over. One bright May morning we drove down through the town, out across the iron bridge that spanned the river, and slowly up the long slope of hillside where the road climbed to the high "divide."

The boy looked back from the hilltop and waved his hand in a good-by to the little river where he had lived so many summers and was now leaving to explore other and unknown lands.

Our outfit was a light spring wagon with a canvas cover and a first class pair of tough little bronchos that would pull, buck, kick or run off with equal vehemence. Packed away in the wagon were all the things that make a camper's heart glad, but there was a conspicuous absence of the many useless and cumbersome things that are made for and used by the would-be camper who expects cream in his coffee in the wilderness and kicks if he has to use a saddle for a pillow.

There wasn't much weight in the wagon, but the boy and I made a good many hundred miles with what we did have. This voyaging across the grass land was a joyful experience for both, and the boy found so many new things to ask about and want information on that it kept me busy answering him.

Up along the divide we journeyed until it was time to head northwest, and then we wound down among the cut clay cañons and entered the great wide valley of the Platte.

"Say," said the boy, as he saw this strange river, "this is a funny kind o' river, ain't it? I've heard about it lots, but I never saw it b'fore, 'n' I reckon I don't think much of it, now't I have seen it. What's th' use o' a river t' ain't got any trees 'long it 'n' nuthin' but sand bars with a little water 'round 'em fr'm one bank t' th' other? Hump! Why, a blamed ole catfish 'd have more sense 'n to live 'n such a place, seems t' me!"

"That's where you don't know. Now, let me tell you something about these sand rivers, because you may want to know before we get back. There are plenty of fish in all of them, but you must understand that they stay in the deeper places, where a current swings around a bend and undermines the bank, for instance, or where a log happens to make a 'bore' in the sand by swinging the current into one place and making it wash the sand away. Now, when you know this, you will not have much trouble in catching a mess of catfish in the Platte or either of the Loup rivers, if you use frogs, minnows or grasshoppers for bait, depending on the season of the year, you know."

"I'm goin' to try 'em first chance I get, 'f that's th' case. I'd like to fool some of 'em just fer fun," he answered.

A few days afterward, when we crossed the South Loup, the boy made his promise good, and we feasted on catfish to our hearts' content.

One evening, as the sun went down, it threw a long, low line of hills into blue relief in the distance, and the boy noticed it.

"What hills are them, 'way off yonder—hain't the mountains, are they?" he asked.

"No; those are the sand-hills, and before noon to-morrow we will be driving over a strange country—one that is always moving toward the southeast."

"Ah, g'won! What yeh givin' us?" said the boy.

"It is a fact, nevertheless. You see that range of hills is nothing more or less than great heaps of sand, partly grassed over and so dry that the wind always blows the northwest side over the top of the hill and leaves it to sift down on the southeast. You see the edge of the desert country up there, and by noon to-morrow you will have seen the hills move and will know how it is done

without any telling. This country stretched from here to the Niobrara River, and after we cross the Dismal River we will follow the Middle Loup right through these sand-hills to the other side, where we will come out at the Pine Ridge country, and that is the last outlying spur of the Black Hills, where they peter out and come down to the level of the grass country. From there the hills get higher and higher, until you get up near Deadwood, then they begin to slope the other way again. You will see all these things as you go along."

"Ain't they any water 'n these sand-hills, only where the rivers cut through?"

"Yes, they are full of little lakes of the finest kind of water, and in season they are alive with ducks and geese. It's a great game country all through—plenty of deer and antelope and a good many elk in parts yet. It used to be a great buffalo country, too, but they are all gone further west or northwest now, and what few are left are pretty wild. It's a Sioux country, too, so we may have a chance to see what a war party looks like before we get back."

"Well, I dunno 's I'm lookin' fer any Injuns to speak of, 'n' I didn't come out here to do any scrimmagin' 'round 'mongst 'em, but I reckon we kin show 'em some fun if they come 'round lookin' fer a fuss."

There was a jolly smile on the boy's face while he spoke, but there was a glitter in his eye and a flush of color on his cheek, too, and I knew how well he could shoot, so I concluded it would be pretty unhealthy for a small war party of Indians if they met those repeaters of ours in a fair open fight—the boy would be apt to think he had struck a diversion and shoot and laugh at the same time—he was built that way, and was a Western boy, who naturally figured on a good Indian being a dead one.

However, no one got our scalps and no war bonnets came within our range of vision on the trip, and the boy found plenty of new and wonderful things to keep him busy asking questions, and me equally busy explaining. It would take too much space to tell you how he thought a soap root was a kind of a palm tree, "er palm bush, like," as he expressed it, and how a mirage fooled him into looking for a lake one afternoon, how he wondered what horned toads lived on and was puzzled about what kind of a bird a young curlew was—he "reckoned it might be some kind o' a ostridge or somp'n o' that breed, on'y they wasn't no ostridges in th' United States, t' he ever heard of 'ceptin' them 't was brought here fr'm Africky."

He even went out and climbed among the sand dunes the first night we camped on the edge of the sand-hill country, just to satisfy himself what kind of sand they were made of. He was an inquisitive, wide-awake, growing boy, with a thirst for travel and the knowledge it brings with it in those days, and gave no promise of developing into the staid, steady man of to-day, who talks good English, albeit there may be a good Western word crop out now and then when he gets into a thoughtful mood and talks of the days that are gone, when we have watched the golden sun sink into the purple west and leave the sky a burning wilderness of color against which our white-tilted wagon stood in bold relief and our camp smoke twisted a thin blue spiral. EL COMANCHO.

In Canadian Woods.

Editor Forest and Stream:

I have not had a word to say to you or your readers for a long time. My all-summer, every-day experiences in canoeing, camping, fishing, etc., seemed not worth reporting, however interesting to the participants. We had a very pleasant and busy summer, but nothing at all out of the ordinary until in September I made a trip to some waters little or not at all known to me up to that time. The story of this even will, I fear, be commonplace and uninteresting to outsiders, but you shall have it.

The passengers were my young friend Merrill and myself. The crew consisted of Pierre Kiolet, guide and sailing master; Hippolyte (Poleet for short), now ten years in my employ, and Eugene, a new hand. The start was the usual one, across Lake Clair, down the 250ft. cliff to Lake Long, where the two canvas canoes were in readiness, up that lake, up its inlet to Lake Montauban, up another shallow and crooked stream to and then across Lake Nicholas, three and a half hours' steady paddling at the best. We had expected to meet another man at a certain point, but he was not there. Dinner and waiting for him used up two hours. I knew he must have had good reason for disappointing us, and this we afterward found to be the case. He might have served as guide or canoe-man, but for heavy portaging, which was what we wanted of him, he was entirely incapacitated. A few years ago I would have backed him against any man I ever knew for that work, but those days are past.

So we went on without him.

One thing surprised me. Pierre, with a stroke that seemed to cause him no exertion, and that he could keep up for hours at a stretch, got his canoe along as fast as the two others, who were no more heavily loaded than he. His two passengers were useless. The young man, unused to such labor, would have been completely exhausted in ten minutes, and the old one had been positively forbidden by the power behind the throne either to paddle or carry. Poleet was strictly charged to see that this order was obeyed, which he did. Now either Poleet or Eugene weighed 15 or 20lbs. more than Pierre, and Poleet we know is good for a lift of 400 or 500lbs. any time. He reminds me sometimes of Porphyos in "Vingt ans Apres," where he raises a stone that seven men could not stir. When we are handling heavy timbers and two or three men are fooling around and not half trying to lift, he pushes them away, saying, "*Lachez. Laissez venir le bonhomme,*" or, as we might say, "Get out of the way. Let your uncle take hold," and up comes the stick. But, except for an occasional spurt, the two could not get ahead. Of course, this is the result of lifelong habit and experience. Pierre is a half-breed, and inherits the good instead of the bad qualities of both races. Once, before I knew him much, I asked if he was a good canoe-man. The reply was, "*Sacre, il était eleve ta de dans* (Sacre, he was brought up in one.) When I tried him, his handling of a canoe was almost a revelation to me.

Another thing I had noted in the amount of power and energy that our visitors put into an out of a paddle when they take one, as compared with the regularly employed men. The regulars expect to work all day and not be too tired to dance or frolic half the night while the transients work to get the job done. It happens that many of my visitors are professional men, who perhaps were college athletes in their day, though now long out of training. When they put a paddle into the water the canoe jumps. Once in a while we get hold of a younger man, who is still more or less in athletic form. Poleet knows what to do with those. He gives them the bow of the canoe and lets them work, while he sits in the stern, making believe to paddle, but doing nothing except steer.

But where was I?

At the far side of Lake Nicholas we "took to the woods." With our loads we had to make two trips on each portage, of which there were three before reaching Lac à la Truite, one up hill and long, the other two shorter, but through swamps, with mud to our knees. We took the precaution to get a canoe and fishing tackle over first, so that Merrill and I might get some trout for supper, which we did, enough for the party. Nothing extraordinary, an average of about $\frac{3}{4}$ lb. By the time we had done this the men had got the baggage over and the tents set up, and in the beastliest kind of a place. No getting in or out without climbing over a stump, but it was too late to change.

It was just then and there that Jupiter Pluvius took charge of the weather department and administered it without the slightest regard to our wishes or to any of our remarks. We worried him a little by turning a canoe up side down, supporting it on some forked sticks and hanging some of our clothing under it. As for the rest of our clothes—well, they were wet anyway.

Next morning early we started Pierre off to a settlement six or seven miles away for another man, the rest following later. We reached our agreed meeting place on the River à Pierre about noon, and a couple of hours later Pierre came with his man, who proved a very good one. Rain? Why, yes, of course it rained, but it didn't quite exactly pour until about the time Pierre arrived. As one of our old camping grounds was near by and all ready for use, we decided not to try to go further that day. The tents were pitched in a regular downpour, which never let up till toward evening. A jolly big fire dried us out in part during the night, and the next morning was fair.

We started a little late, going down the Pierre and making three portages, not very long nor very bad, though requiring two trips each. Instead of following the Pierre to its mouth as I have done before, we went across country, reaching the Batiscan River a couple of miles or so further up. This was a good two hours' very hard walking, but we cached a part of our provisions and made only one trip.

But here we met our mishap. Arriving at the bank of the Batiscan, my young friend came limping up from the rear and reported that he had just stumbled and fallen into a hole and strained a ligament, already once injured in a football game. This was a serious matter, and how serious he knew far better than I. The poor fellow said but little, but he knew that the trip that he had anticipated with so much pleasure for the last two weeks was ended, and that recovery even with the best care would be an affair of weeks and possibly of months. And here he was in the wilderness with no knowledge of how he could get out short of being carried back bodily over the road we had just passed. Knowing less about such accidents, I did not at once realize how serious this was, and still hoped that a day or two of rest would set him to rights. We were two miles or more below our intended camping ground, and the river here is almost a continuous rapid. After a little rest and a light lunch, we got the poor chap into a canoe, and Pierre and Poleet paddled and poled us up to our destination. It was hard work, and all of Pierre's skill and dexterity in handling a canoe were brought into requisition. The other men succeeded at length in getting all the baggage up safely, though with a great deal of trouble, for the river, although mostly rapid as a sluiceway, was in many places very shallow and full of boulders of all sizes. They grounded often, and finally reached the shore with several inches of water in their canoe. Here, at the foot of the Rapid à Thifant, our tents were soon set up, and after helping Merrill to bandage his knee, Pierre and I pushed out for some trout. I had no such luck as I have had there before, one story of which I told in FOREST AND STREAM some years ago, though I got what trout the party could eat.

The next day was Sunday and no work was done, except to make a pair of crutches for Merrill and a couple of men went in the afternoon and brought up the provisions we had left behind the day before.

There was a question whether we should all turn back with Merrill or arrange to have him go alone, which was quite possible. He decided it. Although he could not walk, except a very little on his crutches, he had no pain and was quite able to care for himself. We were within four or five hours of the lake that was the immediate objective point of our expedition, and he would not hear of my turning back. He would either stay where he was with one of the men while I went to the lake with the others and came back, or he would go down the river to the nearest railroad station with two of the men, who would leave him and come back to me. I could then go on and follow the route we had intended to go together. The lake was without a name, except the common one of Lac à la Truite, or Trout Lake, and we had agreed that when we arrived there we would rechristen it with the name of a certain young lady. I had for years wanted to visit it, and a year and a half before had sent up by the lumbermen's winter roads a canoe and some tinned provisions, hoping to go there in the following summer. In winter it could be reached with comparative ease, but in summer the route we were taking was the most feasible one. I had heard extraordinary stories of the trout in that lake from two of my intimate friends, who had come on it when caribou hunting, and I had once tried it myself in winter—under a special authorization from the Government, as regarding fishing laws—with most encouraging results. Now I wanted to throw a fly on it, in all probability the first man to do so. The only advantage to Merrill in our turning back would be that we should bear

him company for a few hours. It was decided that I should go on.

Monday morning we put him nicely into a canoe and started him off. It was six miles or more down that Mechant Rivière (wicked river), the Batiscan, with many small rapids to be run, besides that—to me—very ugly one, Les Trois Roches. But with Pierre and Hippolyte I had no fear, Pierre having positively promised me that he would take no risks, and while Poleet was no such canoe-man as Pierre, he was strong and able, and I knew that I could rely on his faithfulness.

The disappointment was hard on poor Merrill, and his eyes were not dry when I gave him the parting handshake. Were mine? I cannot say. They are old and weak at the best.

I reckoned up the time I thought the trip should take and began to look for the canoe at 11 o'clock. At 12 I began to be uneasy. At 1 I sent a man to the opposite shore, from which one could see further down the river. Once he came back and reported nothing in sight. I sent him again, to a point still further away. It was not until after 2 that I saw the welcome signal that a canoe was coming.

All had gone well except for some delays on shore. The passable rapids had been safely run and the impassable one portaged, Poleet carrying Merrill on his back. He was left in the care of acquaintances of mine, who would put him on the train and see that he wanted for nothing. Some ladies to whom he had telegraphed of his return met him on the way, and he was under a friendly roof that same evening.

While Pierre and Poleet were taking their dinners the rest of us struck camp, putting nearly all the baggage into Pierre's canoe, the other we hid in the woods. Pierre poled his canoe a mile and a half up the rapids, declining help, while we walked through the woods with only trifling loads, arriving at the designated point a few minutes after him. Here the portage promised to be a hard one, and there was a dispute about loads, in the midst of which Pierre picked up his canoe, axe and rifle and went about his business, leaving the others to settle affairs as they liked. The discussion was not bitter, being more as to how three men could carry five men's loads than how any man could avoid taking his full share. I was at length obliged to interfere, a thing not often necessary.

The road proved indeed even harder than we expected. It was up hill, of course, and followed a long disused lumberman's road, crossing and recrossing a score of times a Laurentian Mountain stream from which the bridging had been carried off or had rotted away. Many readers of FOREST AND STREAM know what these streams are, and have passed through these same experiences time and time again. Ours were not worse than hundreds of others, probably not much worse than the average. We endured no serious hardships, nothing worse than discomfort and hard work. These any man who goes into the woods for pleasure must expect to meet—and enjoy.

In about half an hour we rejoined Pierre, quietly waiting and smoking. Eugene came up last, grumbling and swearing at things in general. His load was rather lighter than the others, but not being willing to take the advice of more experienced men, he could never get it to ride well. All the loads were indeed too heavy for such rough ground, where a slip or a misstep might mean a broken leg or worse. I had from the first advised making two trips—never liking to see a free horse driven to death—but all the men preferred trying to do it all in one. There was as much more of this same kind of ground to be got over, and the afternoon was advanced. A peremptory order was given that all stores beyond a day's supply should be left behind.

With lightened loads we went on cheerily, although Eugene continued to grumble and swear until it became necessary that he should be "sot on," after which his usual good humor returned. By and by Pierre struck off into the woods, and we presently came to a more level country and more practicable road. It was nearly dark before we came near enough to the lake to see trout rising in the distance, and too dark before Pierre and I could get equipped for them to do more than take a few for our supper, none very large. We ate them by the light of our camp-fire, after which I formally renamed the lake, as well as proxy for my unfortunate young friend as for myself. My tent had been set up, but the men slept in an old lumber camp, a kind of accommodation that of late years, having had experience, I avoid whenever possible.

For the last two days we had had but little rain, although getting heavy showers at night, and this night was no exception. We had thunder, lightning and rain in abundance. In the morning Pierre and I were out early, but had no great sport. Later he and I with Simeon went to the other end of the lake to look for the canoe and provisions I had sent up a year and a half before. The lake is a very pretty one, some two miles in length and half a mile wide, with pleasant looking shores, and being on the top of the dividing ridge between two rivers; the mountains about it are not very high. We found the canoe all right, stored as directed, but the tin boxes had been opened, and except the hard tack, which was as good as ever, everything was spoiled. Nothing had been taken, and we judged the opening had been done in search of liquor. My experiment of keeping cooked pork in hermetically sealed boxes failed on this account. I had not placed too much reliance on its success.

There is another smaller lake about half a mile away according to our maps, where the trout are said to be even larger and more plentiful than in this one, and I had proposed to go there. But by this time the sun was blazing out red hot, and there were heavy white clouds in the west. Moreover, I was either lazy or tired, or both, so I contented myself, while Pierre was gumming up the old canoe a bit, with sending Simeon to investigate the portage. I do not know how far he went, but he returned and reported that the lake was a good deal further away than we had thought, and that the road was swampy and very bad. We returned to camp, where we arrived just in time to escape the worst of a heavy shower. Pierre took his rifle and went off to try and find a short cut to a point on our further journey. He came back late in the afternoon, unsuccessful, the ground being wet and rough. But he reported finding a great lot of very fine timber, which was of more importance. We heard several shots, but he brought in no partridges, at which he was greatly cha-

grined, until he examined the rifle and found it was sighted for 200yds. Then he was not surprised at his ill luck. After he had taken some dinner, having eaten nothing but a single biscuit since our early breakfast, we went fishing again, but had no greater success than before. We came back discouraged and disgusted, this being our last chance at this lake, but we had hardly got the rods taken down and packed away before we saw the fish rising by dozens—and evidently big ones—right in the part of the lake we had just left. It was about the time at which we came in sight of the lake and seen the same thing the day before, and now, as then, it soon grew too dark to fish. It was aggravating.

Meanwhile Poleet and Eugene had brought up the provisions left behind the day before. It was no hard job, and the men were all in good humor.

After supper Pierre and I consulted. I had a positive engagement on the following Saturday morning. We figured up time and distances and found it would be impossible to meet it if we followed out our original plan. But we could go over a part of the route and then by cutting across by a perfectly practicable way, through a country equally new to me, and likely to be equally interesting, it could be done. So it was resolved.

G. DE MONTAUBAN.

[TO BE CONTINUED.]

Cruising on the Florida Gulf Coast.

TARPON SPRINGS, Fla.—I believe I promised you the earliest news from old John Gomez. The yacht Maud, Com. Knapp, has recently returned from a cruise to Miami. She brings word that old John is not only on the face of this earth, but is very much alive, and notwithstanding his 117 years can still paddle his own canoe.

He is still able to manage his own boat, fishing and turtling, and bids fair to do so for some time to come.

It is easy to see he has failed somewhat, but his courage is such that he will not admit any weakness. I shall try and get down to see the old man some time this winter.

The Maud was gone about eight weeks. She reports a very enjoyable cruise. She went up the inside passage from Cape Sable to Miami via Cards Sound. Although the prevailing northerly winds caused low tides, they made out to get through. Perhaps they did a little poling and wading; most folks who cruise in Florida do. Still they had a good time. Fishing was good; but they report a scarcity of bird life, as the plume hunter has been everywhere.

The town of Tarpon Springs is wearing mourning. The Tarpon Springs Hotel was burned. It gives Tarpon a black eye, as without tourists things will be dull.

Most of the winter residents are here, and doing their best to catch all the fish in the river. Trout and red fish are biting freely, and every day is a new story of some big catch.

Deer are reported plenty, but hard to get. Turkeys—lots of 'em.

I was much interested in Mr. Burnham's sketch of his visit to Rowland Robinson. I shall not accept Mr. Robinson's statement that Sam Lovel is a creation. No, sir! Sam Lovel just "grewed," and I know him. We all know him. When the last Sam Lovel goes over the river, I want to go too.

I have often thought of asking the readers of FOREST AND STREAM to name their favorite character in the Danvis books. I have tried to decide myself, but every time I read about them I fancy each in turn. I think though that Sam Lovel and John Dart get the most of the honors. Supposing you put the question in FOREST AND STREAM?

TARPON.

Natural History.

Cross-Fires from a Skunk's Battery.

THE trapper learns many secrets in the economy of our furred and feathered friends to which the average sportsman or lover of nature is a lifelong stranger. I was never more forcibly impressed with this fact than during a recent hunting trip in the Alleghanies of Clinton county, Pa. During the six weeks of camp life spent with my wife among these mountains last fall, I was again favored with the occasional company and services of my friend, Seth Nelson, the veteran bear trapper of Round Island. To his forty years' experience with gun, rod, trap and axe in the wilds of the Sinnemahoning, and his ready courtesy in loaning all he had and imparting all he knew I owe much that is related in this article.

Incidental to our bear baiting and deer stalking, I experimented on snaring smaller game from the size of a shrew upward, fox trapping consuming the greater part of my ingenuity and patience. But chestnuts, wild grapes, pheasants and mice were too easily obtained in those glorious October days to insure success in amateur fox trapping. One young fox, however, fell a victim on the last day of our outing, as if to both confirm and deny Nelson's statement that "you might trap for foxes five years and then have to own up that them chaps is one too many for you." As usual, a good many four-legged beasts came along and "put their foot" into our schemes for wily reynard. Porcupines, rabbits, mice, chipmunks and skunks often stumbled into the snares set for nobler game. To the last named animal I was undesignedly led to devote no small attention. My previous experience with this truly beautiful, elegant and useful quadruped in life had been secured at gunshot range, or at that indefinable distance which reveals itself solely through the medium of the nose, in one's woodland rambles. In death I had known it as one of the most pesky, greasy, odoriferous beasts that ever defied the arts of taxidermy. But now I was to see, handle, absorb, and devour this much despised and misunderstood *Enfant du Diable*, or "Child of the Evil One" (as the early Canadian settlers named him), in a fashion more instructive than pleasing. Of course, if skunks did not have the ability to raise a terrible stench on short notice, they would be less talked about and better understood. Their very existence depends on this faculty to such a degree that the more typically carnivorous weapons of tooth and nail have degenerated in the family *Mephitidae* to mere

organs of subsistence, long, straight claws for digging and small, weak teeth for chewing the insects, mollusks, reptiles, birds and mice on which they subsist. In other words a skunk is such a harmless, confiding, well-fed animal, so conspicuous and tempting withal to the uninitiated beast of prey and so poorly armed for an encounter, that we can easily believe the whole tribe would speedily become extinct if they were suddenly deprived of their scent bags. On the other hand, did not man and some of the lower animals, as owls, hawks, dogs, wolves, wildcats, and starving foxes, overcome their prejudices and prey occasionally upon the skunk they would become a nuisance.

The once popular idea that a skunk urinates on his long, bushy tail and then distributes the ill-smelling fluid by a vigorous swish of this member into the face of his antagonist, while largely dispelled, dies hard. The fact that this animal in its unprovoked state is one of the most cleanly and inoffensive of quadrupeds, unsuspicious, courting inspection, intent on its own business, yet sometimes approaching a human being out of pure, confiding curiosity, is something not so well known. In this regard the unreasoning popular horrors of skunks and of rattlesnakes are strangely analogous. In both the up-lifted tail is a timely warning against too close approaches; both prefer flight to resistance; neither acts toward man on the offensive.

It was a long while after the Pilgrim Fathers first came in offensive contact with the Massachusetts skunk that one of their descendants ventured to set himself up against the popular ideas of the animal's economy. Thousands, nay millions, of the skins of this animal had mean-

THE SKUNK AT HOME.

From Audubon's Plate.

while been shipped from our ports before an American anatomist named Wyman* tackled a skunk's carcass in the same spirit that Luther faced the Diet, and by wary strokes of the scalpel extracted the secret that the American Indians had tucked away in their sleeves for ages.

It was no great secret after all. Wyman first published the simple facts that in the skunk those same glands found more or less offensively developed in the mink, weasel, otter and other members of the great fur-bearing family *Mustelidae*, are increased to extraordinary proportions, so that it has the power not merely to secrete a few drops of foul-smelling liquid when assaulted, but to eject large quantities of it to a distance of from 4 to 10 ft. against its enemies. Wyman's experiments, as well as those of subsequent investigators, were made with the dead animal. The observations of Dr. Elliott Coues† and Dr. C. Hart Merriam‡ throw much light on the habits of the living creature, but as I find no detailed records of experiments on the live skunk in action, I venture to present some personal experiences with four of these animals trapped this fall in Clinton county, Pennsylvania. Incidentally these touch upon several debatable points, brought up by the able authors above cited. As is usual in experiences of this sort, even if the personal equation is removed the individuality of the animal in question makes it impossible for us to set a hard and fast rule or venture to predict the results of fooling with such explosive material.

The inconsistencies of a skunk are inexplicable enough. For instance, not one in twenty discharge any odor when the trap nips their toes, nor during their struggles to free themselves, though bones may be broken and feet gnawed off during the struggle. Let a human being approach them in this plight, they immediately raise the warning tail, and if incautiously dealt with give decided notice of "hands off."

In his "Biography of North American Quadrupeds" Audubon relates how he stood by the burrow of a colony of skunks and successively killed several of them with a shotgun as they emerged without causing them to discharge the feto. I have been able to kill them instantly in the same way with a like result, but that this is not the invariable rule may be seen by the following: My Clinton county skunk No. 1 was caught in a steel

* Proceedings of Boston Soc. of N. History, 1844.

† In Monograph of the *Mustelidae*, or Fur-bearing Animals.

‡ In Mammals of the Adirondacks.

rat trap set in a runway for rabbits. It had torn up a small circle of earth and bushes, and was half-dead with cold and exhaustion, but no odor was perceptible. Thinking to kill it so instantly as to prevent a discharge, I dispatched it with a load of shot at close range. Two grains of No. 6 shot broke the skull, one passing through the brain. To all appearances death was instantaneous, but there was a heavy discharge of the fluid. The action in such cases must be purely spasmodic, but why not always so is a problem, unless the exceptions are due to paralysis of the spinal cord, as suggested by Dr. Merriam. This leads us to another problem, the automatic or sympathetic (?) relation of the position of the tail to the action of the scent glands. The tail of skunk No. 1 was lying on the ground in line with the back when the shot struck, but in the death struggle it was erected at right angles to the back. This was in full accord with Mr. Nelson's and other trappers' experience that it is impossible for a skunk to discharge the feto against its tail. In spite of Mr. Merriam's contention that a skunk discharged into his eyes and mouth while he was holding it up by the tail, and a dog was worrying its head, we may safely assert that Nelson's experience is in line with a physiological fact, and that Dr. Merriam and his dog did not succeed in keeping the spinal column of his animal in a straight line during the fracas.

Let any one who is skeptical of this rule and has not been favored to closely observe the glands of a skunk in action manipulate the battery of a dead animal. As the tail is drawn at right angles to the back the movement likewise acts automatically in protruding and constricting the scent glands one on either side, and in exposing the teats of these glands, so that they may be directed backward at the will of the animal in the normal position for a discharge. The raising of the tail in itself cannot cause a discharge. It is analogous to the cocking of a gun; the pulling of the trigger depends on the volition of the animal. An artificial discharge may be performed on the dead animal by raising the tail and applying external pressure upon the glands. Reversing the movement, the glands retreat, the pressure upon them relaxes, and when the tail is at an angle of about 40 degrees they are entirely concealed, rendering an external discharge impossible. To emphasize his theory, and at the same time show his faith therein, Nelson declared he had more than once picked up an over-confiding skunk by the tail while it was innocently prowling about the woods and killed it without evil consequences. Happily I have had no chance to test my faith in this trick, but my firm belief in Nelson's statements led me into other experiments, both entertaining and instructive, demonstrating the individuality of certain skunks and the honest fallibility of the most truthful trapper that ever lived. These may best be told in the words of my journal: "Oct. 17.—Seth says it is easy to get a skunk out of a trap without making a smell of it. 'Just play with him awhile, till he gets used to your being around, and then pick him up by the tail and give him a whack with a stick over the small of the back. Then strangle him. No trouble at all. Why, I've gone up to one on the road and picked him up by the tail and killed him.'" A week later I note: "I had agreed with Seth to meet him early at the bear traps, and then hunt for deer. First I visited my nearby traps, and found a very spirited skunk in the one where the rabbit had been eaten the night before. I fooled with the pesky thing a while, and then decided to test Seth's magic on this one, so left it fast."

Came back to dinner by way of skunk trap, and Seth vainly tried to coax the spiteful beast to let him take hold of its tail. It would hold the tail up in a most convenient position for handling, but that was not reassuring, as its battery was always trained on the enemy. Seth declared he never saw one so frisky. At last he made a stroke with a stick across the animal's rump to deprive it of the power to shoot, but struck too far forward and the crisis came quickly. We were on the windward side, and the spray only reached about 5 ft. from the animal against the light breeze. Its yellowish green color could be distinctly noted. The form of the jet was like that from the nozzle of a lawn sprinkler, set to make the water spray very fine over a circle 5 ft. in diameter. At first it came directly backward, but the last part of the discharge was directed from one of the nipples sidewise, being aimed at Nelson, who had stepped aside to avoid the first onslaught. Neither of us were hit, but the trap and the skunk both got well scented. The next stroke of the stick broke the animal's skull. It had been caught by the hindfoot, the part below the jaws of the trap having been entirely devoured by the imprisoned beast, at least I could not find any trace of the missing fragments."

Evidently Nelson was quite as fallible as other great men. Nevertheless I could see both science and common sense in the idea that even "a bold, bad man" could persuade a trapped skunk to let him whack its spine in such a way that it could never raise its tail again, and so silence its battery forever. It was desirable, too, for scientific and æsthetic reasons, that I should secure my "Alaska sable" with least breakage of bones and smallest quota of perfumery. How this idea was persisted in and practiced upon is narrated in the following journal entry, penned by my wife, because of a little trouble I had just then with my left eye: "S. concluded to visit the traps near camp, which Seth had him set for rabbits in a runway between two huge rocks. In one he found skunk No. 3, and having been so heartily assured by Seth that a whack across the base of the tail would paralyze the stink nerve, he tried it, first coaxing around the animal until it seemed friendly. Then came the blow fair upon the spot—result, just a little smell. Then the animal seemed quiet enough, but to make very sure, he whacked again. This time no more smell, so he loosened the trap chain and carried the whole outfit along gingerly about half-way to the shanty. Coming to a flat rock, he determined to end its sufferings, so placing the outfit on the rock he began to hold the beast down with a forked limb until he could set foot on the right place to suffocate it, when, lo, the nerve worked! Not blindly nor at random, but most accurately did it work. With a sudden right-angled twist of its body the poor beast shot the lovely yellow fluid into my husband's eye and well over his left side. He says he jumped around lively, and is glad there were no spectators, and that he had something of a

private nature to say to that skunk before he was able to see again just what had become of it. Its skeleton was not preserved! I'm thankful to record that in spite of eyes, nose and throat being filled with skunkishness, he ate a hearty supper of stewed bear ribs and baked potatoes."

When my vision returned I could not refrain from jotting down a few items on the affair, as follows: "Seth Nelson is an honest man; he has had lots of experience, but—when it comes to infallibility the Pope can give him some pointers. When I see Seth and Seth smells me, he will gently smile in such an exasperating way that I can't help laughing outright. His rules and regulations for keeping a live skunk sweet are 'subject to change without notice.' I have proved that an '*enfant du diable*' can fire his gun at an angle of 90 degrees to his lumbar vertebrae and hit a man fair in the eye quicker than a wink. As for the odor, it is losing its terrors; I am getting used to it, and somewhat saturated withal, so that I have to get my wife to smell things for me to see if they are bearable before I enter the shanty. In short, the odor of a skunk is not what it is cracked up to be, and I realize how some wild animals kill and eat him in spite of his gunpowder. I shall eat this one myself, to get even with him."

In the final experiment, conditions were most fortunate for determining the manner in which a skunk can train its breechloader, also the amount and quality of the ammunition at its disposal. It occurred the next day and is thus recorded: "The trap set yesterday among the rocks for a porcupine contained skunk No. 4. As usual, it had eaten the caught foot off up to the jaws of the trap. No odor was perceptible. It could get just far enough under the rocks to hide all but its extreme hind parts, and there the trap held it. Perched upon a big boulder, directly above and out of range of the excited animal, I was master of the situation. At this juncture a loosened stone rolled against its hind leg in such a position as to receive the full force of the resultant discharges. As the stone made no objection, and the air was clearer for its service, I let it alone until the magazine should be exhausted, meanwhile watching the process of expulsion and nudging the beast with a stick to expedite matters and test its powers of manipulation. Perhaps it fired off a tablespoonful under these conditions, and then the stone was removed, and a closer inspection made of the movements of the depleted glands. The animal could discharge from the right or left teat separately, according to the side touched, in such a way as to foul the stick in nearly every instance, whether above or on either side of the orifice, so that I soon saw how the one killed yesterday had served me such a dexterous trick. When the supply of fluid was exhausted it ejected with decreasing power a dense yellow substance, which appeared to be the dregs of the normal fluid, resembling drops of curds. These amounted to about 1/4 oz. before the supply was exhausted, and were not expelled more than 1 ft. from the glands."

This experiment was of great interest in its conclusive proof of the independent action of the glands, their mobility and capacity for intelligent directive effort on the part of the skunk, and the ability of the animal to work his battery intelligently against an invisible enemy.

ACADEMY OF NATURAL SCIENCES, Philadelphia, Dec. 19.

The Seaboard Air Line.

THE migration during the fall of 1898 was unusually large as compared with that of any year during the last ten. It began in late September with the passing of hundreds of the charming bird families that real estate agents never see, though at times for days together the low coppices and fragments of natural coverts (always the last to fall before the ruthless advance of a city) fairly swarmed with their restless forms, while the still air held the music of their voices for a space in these localities. In early October their tiny voices floated down to me at night as they swept along under the stars. Bunting, finch, warbler, all were there, traveling in the dark. Plover, sandpiper, ayé geese and swans. They must have known I was listening, for they called to me as they passed, just as they have done year after year for half a lifetime. They could not see me, so they called, and oft I answered. Many a ringing response has come to me from out the chill of the starlit sky. Oh! the mystery of it! the witchery of these night migrations! I wonder if they appeal to others' of your readers as they do to me.

I saw an unusual number of bluejays en route this fall; one still, misty Indian summer day, thousands of them crossed the lower bay bound for Staten Island and Jersey. The cause of the fall migration is always the same. During the last twenty years I have not known it to vary. The flight comes from northward and extends along the Bay to Bay Ridge and Fort Hamilton, where the main body cross via Staten Island to Jersey, and so on down the coast. Highholders were here in myriads for at least a week, when one golden morning they started high in air; all day long they were crossing; I saw thousands go by from my vantage ground on Van Brunt's Point (which, by the way, is the most westerly point of Long Island), all bound south.

As I have said, the smaller varieties were in large numbers during all the fall migration. As for the geese and other wildfowl, I have heard the bugle calls of a still night as they drifted over from the men-o'-war anchored off Tompkinsville, answered by the trumpets of a gang of wild geese as they swept by far overhead. The geese have passed in large numbers. I saw many and heard more, and have to chronicle the unusual incident of a large wild goose alighting in the grounds of the Crescent Athletic Club, where it was secured by the superintendent, Mr. Kerr. We had a three days' flight of hawks Sept. 26-29, heaviest on the 27th, when, look where you would in the clear sky, their circling forms were seen in numbers.

In these low barometer days a few woodpeckers, with an occasional solitary hen hawk, serve to emphasize the dreariness of the unimproved town lots that still remain. Meadow larks, starlings, and a few odds and ends are still fairly plenty in the vicinity of Bensonhurst. But I must conclude.

I had thought of heading this desultory chat "Bird Life in Greater New York," but older than Greater New York,

dating way back among the hills, the Seaboard Air Line was established and thousands of feathered travelers take this "route" twice each year in preference to any other. Having lived my life at one of the way stations on this old and reliable line, I have taken stock in it, and yearly receive a large dividend of pleasure from my holdings. Next spring when the travelers return, and call down to me in passing, D. V. I will answer them, and wish them "godspeed," for I know many of them.

WILMOT TOWNSEND.

BAY RIDGE, N. Y.

Caribou in Maine.

It is very uncertain at what time caribou first appeared in Maine. John Josselyn in his "New England's Rarities Discovered in Birds, Beasts, Fishes, etc.," published in 1674, from voyages made from 1638 to 1663, says: "The Maccarib or Caribo, a kind of Deer, as big as a stag, round hooved, smooth haired and soft as silk; their Horns grow backwards along their backs to their rumps, and turn again a handful beyond their nose, having another Horn in the middle of their Forehead, about a half a yard long, very straight, but wreathed like an Unicorn's Horn, of a brown jettie color, and very smooth. The Creature is nowhere to be found, but upon Cape Sable in the French Quarters, and there very rarely, they being not numerous; some few of their skins and their straight Horns are (but very sparingly) brought to the English."

Again he says it "is not found, that ever I heard yet, but upon Cape Sable, near to the French Plantations."

In his two voyages to New England (1672) he gives six names of the deer tribes, several of them duplicates. He seems to have known the Virginia deer and moose intimately, but the caribou only by hearsay and by sight of their skins. It is very evident that although he mistook the horns of the narwhal for a middle horn of the caribou, that he had seen the skins and heard a good description of the animal. From this it would seem quite certain that from 1638 to 1672 there were no caribou in New England, and as both Wood and Roger Williams speak of the Virginia deer and moose, and neither of them make any mention of having ever heard of the caribou, there seems to be good reason to suppose that up to the time of their writing none had come to New England. The first mention of the caribou being found in New England is in "The American Universal Geography," published in 1802 by Jedidiah Morse. In giving the list of the animals found in the United States, he says: "The importance of this part of our natural history has induced the author to pay the most assiduous attention to it, and to seek information from every authority on the subject." He also says: "The caribou is distinguished by its branching, palmated horns with brow antlers, and that it is found in the District of Maine."

My father has often told me of finding caribou on the Passadumkeag, some thirty miles northeast of Bangor, between 1825 and 1830, but at that time none were found lower down on the river. Some time about 1840 they began to appear in large droves on Chemo bog, some fourteen miles from Bangor, and on all the large bogs to the east of us. I used often to hear the hunters tell of seeing from twenty-five to fifty in a drove on Chemo bog, and also on the Cherryfield barrens. I well remember one hunter bringing in three skins, which he said he shot from a herd of at least seventy-five in Chemo. Just when they began to migrate I cannot tell, but they must have all gone in a very short time, as I do not think there were any as late as 1845. In 1852 I hunted six weeks between the head waters of Union River, Passadumkeag and Naraguagus, but the caribou were all gone years before, although I saw two shed horns, not mates, which, having been shed on a bog, the mice had not eaten.

Now where did the caribou go when they left Maine? One would naturally suppose that they would go east, as the country there is well suited for them, but I think I can show very strong proof that they did not go east, or if they did, that they did not stop this side of the St. Lawrence.

Early in the fifties two Maine hunters, Henry Clapp and R. B. Philbrook, of Brownville, Maine, reached the Restigouche, by way of Grand River and Wagon Portage, and went down that river to the Kegwick (Wetomkegwick), and going up that some miles stayed nine months, hunting over a large territory, and in March moved their camp a long distance. I afterward hunted with them both separately, and both told me that they saw but one caribou track. This one kept round a mountain, and they finally shot him. In 1858 the writer, in company with three others, went up the Tobique, and we were a month traveling in the vicinity of Bald Mountain, some of us a good way down the Barthurst. We were nearly over to the head waters of the Miramichi and a long way to the northeast, toward the Restigouche, and from the forks of the Tobique to Nictor Lake, a distance of forty miles, we explored back in many places, but none of us saw any signs of caribou except the tracks of two on Bald Mountain. Several months later one of the party shot two near the forks, but up to that time they could not be called plenty in New Brunswick. The first any one in this State heard of caribou returning was in the fall of 1859, when a large bull was shot by a man named Morrill, near Guilford, Me. This was shot a little southwest of Moosehead Lake. In February, 1861, another was shot at Eliotsville by A. B. Farrar. This is nearly south of Moosehead Lake. In March, 1861, R. B. Philbrook and T. W. Billings shot another on Alligash Lake. This was a cow, and although late in March, had quite large horns. I was there a few days after this was shot, and saw the skin, as also the other two. In 1857 and 1869 I was in the woods a large part of the fall, and was over a large territory. Also in the spring of 1861 I traveled over many townships on the heads of Penobscot, Alligash and St. Johns, and in the summer and fall of that year went by canoe from Mattawamkeag to the north corner of Maine at the foot of Boundary Lake, but did not see the track of a caribou or see any hunter who had seen a sign of one, except the three already mentioned, and those as near as could be told all came in from the west. As they began to increase they became plenty in the country to the west of the East Branch of Penobscot, before they worked their way further east, and in fact only a very few ever reached their old haunts on the Mattawamkeag, Machias and St.

Croix. Now that they seem to be slowly leaving, there seems to be good reason to believe that they are going east, from the fact that they are reported as being so abundant in New Brunswick. Cannot Mr. Risteen or some of your other correspondents tell us about when they began to increase in New Brunswick, and from what direction they came, and whether they now seem to be located or are still moving gradually east or north?

M. H.

"Old Red Legs."

Editor Forest and Stream:

Feeling myself to be in a position to give Mr. Townsend the information desired regarding "Old Red Legs," as I have under continual observation a number of wildfowl of several species, among them a flock of black ducks of various ages, I feel free to assert that the bird in question is the *Anas obscura* fully matured, and in winter plumage, and two years old at least. His bill is pale olive, head and neck light gray, stopping sharply in the brown body feathers, legs almost vermilion in color, weight in good condition over 3 lbs., female slightly smaller, other markings identical excepting bill, which is much darker olive barred by broad black smooch across the middle, the above difference being the only distinguishing mark I have found always existent. Contrasting this bird with those shot earlier in the fall, which for the greater part are young ducks, drakes having slaty bills, hardly to be distinguished from that of the female, legs of both a dusky red, I find them to tally absolutely with young birds bred by these same "old red legs" under my observation. The species breed to a feather. A reason for the late migration of the mature birds, which to me is convincing, is the fact that the mother duck does not moult and shed her pinions until the young can fly. I can also assert that they undertake their fall migration regardless of their mother's feelings in the matter, that is, whether her pinions are strong enough.

Birds having mallard markings are probably the result of a cross while Mrs. Black was accumulating her setting, the accident influencing the fertility of an egg or two; and the accident would not have occurred had the master been about at the moment, for there would have ensued a battle royal on the first manifestation of anything improper on the part of the mallard, ending possibly in the drowning of the strange drake. That such crossings under natural conditions are rare is proved by the very infrequent specimens observed by gunners. They are possibly the result of matings of cripples of two species, but more probably the result of accidents as pictured above. For the female is at once an extremely jealous and faithful consort, always scolding frivolous sisters to whom her spouse may incline to extend civilities. May I add that the mating seasons begin in the early autumn, at which time ducks will decoy to almost anything alive—separating into pairs or trios in the spring. I strongly advise spring shooters to make doubles, for if the female survives she will not take unto herself another mate that spring, though assaulted by bands of desirous drakes. I fear I wander from the text, though I could tell of other things about ducks than mark right, mark left. W. L.

BOSTON, Mass.

Feather Tracts of N. A. Grouse and Quail.

IN the Proceedings of the U. S. National Museum, Vol. XXI., Dr. Hubert Lyman Clark, of Amherst College, publishes a paper on the feather tracts of some of our game birds, which is of interest to sportsmen. Dr. Lyman has been able to examine in the flesh sixty-five specimens of grouse and quail, representing eighteen species, and all the North American genera. The paper is distinctly technical, but certain points of general interest may be mentioned. Thus in all the genera of quail, except *Cyrtonyx*, it is to be noticed that the thumb of the wing carries a well developed claw. The quill feathers of the tail (rectrices) are remarkably constant in number, usually only twelve and never more than fourteen.

On the other hand, the grouse all lack the claw on the thumb, the number of rectrices is very variable, being constant within some genera while in others it is very variable. Thus in three different subspecies of the dusky grouse the number varies from fourteen to twenty-two. The details of Dr. Clark's work are interesting, but they do not go far to indicate the origin or relationships of the larger groups of the North American Gallinae.

White Crows.

WEST WINFIELD, N. Y.—During the past fall I discovered near this place a flock of crows. Nothing peculiar about that, save that out of the seven three were perfectly white or nearly so. Having never seen one before, would ask you if they are frequently reported. Of the three, two were killed, the remaining bird now being here and occasionally seen. W. E. A.

[Albino crows are so rare that their occurrence is well worth noting. Several have been recorded in our columns in past years.]

Caribou Horn Measurements.

BURLINGTON, N. J., Jan. 5.—Editor Forest and Stream: I see in your issue of Jan. 7 the record of 13 in., and the remarkable record of one 16 in. plow on the horns of a caribou. I am the proud possessor of one I killed in Newfoundland, of which the plow measures 17 1/4 in.

Elk in the Mountains.

THE month of November came around, which meant that the ranchmen of Big Creek Park begin to "rustle" for their winter's meat or go without.

Two of my neighbors—Harford Loucks and Harry Baugh—agreed to make up a four-horse team and take one heavy wagon and go together, providing I would go along and help to hunt, as neither of them had sufficient record as hunters to give them any comforting assurance of a load of meat to bring home. I had already killed enough deer and antelope near the ranch to feed me all winter, but I agreed to go for what fun I could get out of it, as I was through with my fall work.

The weather looked threatening the morning we were preparing to start, and by the time we had everything loaded up, about 9 o'clock, it was raining. Although we knew by past experience that rain at that time of year in that locality meant plenty of discomfort, there was no stopping at that stage of the game, and we started. When we got to the McAnulty ranch, which was the last ranch before entering the woods, we stopped and ate an early dinner; then continued our course, heedless of the cold and fast-falling rain.

Just as we were about to enter the woods, and at the same time commence a long mountain climb, the wagon went over a big rock and dropped into a deep mud-hole. Harry, who was perched up on the high seat beside the driver, lost his equilibrium and started to earth, head first. The driver caught the skirts of his old overcoat, to preserve as much of him as possible. Harry kept on in his downward course, regardless of friendly hands extended to help him, and landed squarely in the mud-hole in the attitude of a first-class performing clown, while the driver retained a goodly portion of his coat. All persons cannot see things alike, and there were only two of us who could see the funny part of the incident, but it aided us greatly in the next few miles in keeping up good cheer, which is a better preventative against exposure than warm clothes. We reached Hog Park late that evening after a twenty-mile drive through a cold rain, and set about making camp on the thoroughly soaked ground, under circumstances which only well "seasoned" mountaineers could make any pretense of enjoying.

Our beds were wet, our clothes, spruce "feathers" and firewood were all wet. Nine o'clock found us in bed trying to sleep. I had, as I supposed, a fairly good night's sleep, and awakened up, and looking out saw everything white with snow. That was to my liking, and as the snow made everything appear light, I thought day was dawning, and rolled out, started a fire and prepared a hasty breakfast, then shouted to the drowsy sleepers to hustle out to breakfast, that we might get an early start and make good use of the snow while it lasted, for there was only about 2 in.

There was not a time-piece in the crowd. We gulped our breakfast down in a hurry and still the daylight was not increasing. We commenced to wait; we replenished our fire, which we had allowed to burn low. We continued to wait, until the right of more sleep began to assert itself. Conversation almost ceased, and nothing broke the painful silence save now and then a remark tending to destroy any aspirations I might have had for reckoning time. Daylight came, as all things do to those who wait. As nearly as we could tell it was about 2 o'clock when I got up.

Anyhow, we were ready for an early start, and left camp before it was clear daylight. We started out together, but in a few minutes I wished them success and struck out for myself. Before I was out of their sight, and when it was just clearly daylight, I found the fresh trail of seven elk. The conditions were all favorable for still-hunting, and my anticipations far surpassed their realization. I followed carefully for two hours, when I sighted one of them feeding. It was on the brow of a very steep, timbered mountain-side, and the others had moved over the brow of the mountain and were out of sight. I crawled up within easy range and then reasoned with myself thus: "If I shoot that one through the shoulders it will go tearing down through the bunch before it falls, and they, knowing by instinct that the trouble must be coming from behind, will leave at once and I will get no more shots. If I can break that one's neck and drop it, I can hasten over to the brow of the hill overlooking the bunch and perhaps get several shots." Feeling confident I could carry this out, I took careful aim at the neck and fired. It fell on its knees, but recovered immediately and went tearing down through the bunch, which joined in its flight, and left me standing there wondering whether a "bird in the hand" wouldn't have been worth about six in the bush. The one wounded bled freely, and separated from the bunch, followed by one other. I followed for miles until they crossed the Grand Encampment, which was very high and impassable for man. It took all the remainder of the day to get back to camp, where I found the others already in, and one of them had killed an elk.

The next day we hunted some, after packing in our meat, but the snow was about all gone, and we found nothing. The next morning we broke camp and moved about ten miles further west to the headwaters of Snake River, and camped near where four of our neighbors were camped who had gone in while we were in our first camp. We hunted the first day without any success. I found a trail of elk which must have numbered at least three or four hundred, which had been moving westward about three days before. I had been unwell for two days, and decided I would have to give it up and go home. The boys insisted that I go with them next morning and show them where the large band of elk had passed, so that they might follow them, in the hope of finding some stragglers.

We started out, and when near the place where I had seen the trail, as we were going up a ravine, with dead timber ridges on either side, I saw a band of eighteen elk standing away up on one of the ridges looking at us, perhaps 200 yds. away. I called a halt and tried to show them to the other fellows, but as the surroundings were all

covered with dead timber, which was the color of the elk, which were standing still, they could not see one of them, although several were in full view. When they failed to see them, I directed that they should get ready, for I knew they could see plenty as soon as I would shoot. Taking a careful shot at the one standing in the best position, I saw it was hit hard. Then the shooting commenced right lively, but owing to the distance and thick timber it was not effective. We went up and found the one I first shot at lying about 200 yds. from where it had been shot. I went after it, and after some exciting chasing and shooting "bagged" it. They voted unanimously to follow the bunch, while I started for camp, thinking to go home, as I was feeling very much "hors de combat."

When near camp I saw a very fresh deer track, for there was still a little snow in the timber and shady places. I had to follow it through force of habit; couldn't help it, you know. It led me up a very steep mountain about half a mile, where the snow was all gone, and with it all chance for a shot.

The sun was shining warm, and I sat down to rest. I always had a sort of mania for cutting my name on trees, away in some unfrequented haunts of forest. A smooth-barked quaking aspen tree stood near me; I took out my knife and was in the act of beginning my autograph, when I saw at a long distance what I took to be a deer and just supposed it to be the one I was trailing. It was feeding along the edge of green timber, and the space between us was mostly open country.

I started directly toward it, keeping under cover of alders, willows and such bushes as came in the way. When half the distance was covered I got sight of the game again, and saw at a glance it was elk. There were then two in sight. I made my way to the green timber and crawled up within 50 yds. of the two that were in sight and made a successful "double," killing both with two shots. Hearing others on the other side of a rise of ground, I ran ahead and saw five more making off at a lively gait. I got one shot, but missed. As I had not started out to hunt, I did not have my hunting knife with me. As I had often done the work with my pocket-knife, I set about cutting into the neck of the first one. The hide on the neck of the elk is as thick as that of a beef. I gave a vigorous slash with the knife and the rivet holding the blade and handle together broke, letting the blade and handle separate. There I was, quite a long distance from camp, with two dead elk, and a small knife blade to do the work of dressing them, and I was sick into the bargain. I commenced with the knife-blade between my thumb and finger to disembowel those elk, and got through the same day. Any one wishing to know how long it takes may try it. I reached camp at dark, to find the others there empty handed. Of course I was elected to stay another day to pilot them to my last kill.

Going directly there the next morning, we skinned and packed the meat, and I continued my search for more game, while they went to camp. Next morning there was a good fresh snow, and I twisted up my nerves for another day's hunt, although I was a fit subject for a bed and dozer. Out about two and a half miles from camp I found a trail of six elk, and followed it less than 100 yds., when I saw one at close range and killed it at the first shot. I also got a running shot at another, but missed. I followed the rest of the bunch till dark without seeing them, except to get one glimpse in the thick timber.

I was many miles from camp when night came on, but the night was clear and the moon was full. I scared up an elk on my way, which ran off some distance and stopped. I could barely make out the outlines of it as it stood in an open, fallen-timber space, and took a shot just for luck, but there was no luck in it.

The next morning everything was enveloped in a dense fog, and it was snowing. The weather looked treacherous, and we concluded to let the meat stay out which I had killed the day before, and try to get some more. I started out, and only went a short distance when I found a fresh trail of a fine bunch of elk, perhaps twenty. I followed about a mile, when I found where one of the other fellows had come in ahead of me. Thinking to overtake him before he would come up with them, I hastened on, hoping by being together we might finish out our load. I had not gone far when I heard him shoot about half a mile ahead. I went direct to camp and put in one of those days which are not pleasant to recall. Harry came in at about 3 o'clock, empty handed. Harford did not get in till about two hours after dark, and from the rambling and confused account of his travels it was very evident he had been lost or badly confused most of the day, but it was no discredit to any man to get lost such a day. However, he had killed one of the elk and had followed the rest a long distance.

That evening about dark two of our neighbors, who were camped near us, came by our camp with the report that they had killed a bear some miles west.

The next morning there was 10 in. of snow, and it was piling down in great chunks. I wanted to get home that day, but I first had to guide the boys out to where I had killed my last elk. I started out on horseback as soon as I had breakfast, saying I would ride to it, and then come back and they could follow my trail at their leisure and find it. When two-thirds of the way back I met them going with a horse in harness to "snake" the elk out whole, which was the favorite way of moving them when there was plenty of snow. When I got back as far as the camp of our neighbors, they insisted that I stop and spend the day with them. Since it was getting well along in the forenoon, I tarried with them. The boys got in about noon with the first elk, and then started out for the one Harford had killed the day before, as they wanted to get started home next day. About dark I went to our own camp, attended to the horses and cooked supper to have it ready when they came in. I kept up a fire and their supper hot till I judged it to be 9 o'clock, when I rolled in. After I had been sleeping some time I was awakened by their arrival.

They were a sorry looking pair. It had been snowing hard all day, and they had been wading in snow knee-deep since daylight that morning without anything to eat. I had surmised the cause of their delay, and my first question was: "Did you find your elk?" The reply was "No!" and so decided that I changed the subject to that of something to eat, on which I found them more approachable. When Harford had come in the night before

with his random description of where he had been, I had feared he would never find his meat, and so it proved.

As it was snowing continually, we were obliged to make haste in getting out. Accordingly, the boys set to work next morning loading their meat, and I started for home on horseback without waiting for them. After a thirty-mile ride over very mountainous roads and through deep, untrodden snow, I pulled up at my near neighbor's, Elick Hilton's, at 4 o'clock, having my feet frozen some and feeling generally used up. Instead of going to my bachelor quarters at my own ranch I accepted the hospitable invitation to stop, where I laid up ten days for repairs.

After two days of very hard work the other boys got home with their meat, and the hunting for that year was at an end.

EMERSON CARNEY.

MORGANTOWN, W. Va.

A Deer Hunt in the Adirondacks.

THE first of November seemed very slow coming, but it came at last, and then I packed my hunting paraphernalia, and, in company with a friend, set out for the Adirondack Mountains. November 2 we put up at the house of a lumberman, in the forest solitudes of Hamilton county, there to pass the last two weeks of the deer season. Fortunately, however, we did not go so much for game as we did for a vacation. Like Gen. Harrison, we went for sport, and any game we might get we counted as surplus.

We had several days of unsuccessful hunting for deer, it being so dry that the leaves rustled and the twigs cracked under foot, making still-hunting next thing to impossible. The lumbermen explained to us the futility of trying to hunt deer under such circumstances. As one hunter expressed it, the deer had "nothing to do but hark," and could not very well be approached when we made so much noise walking. We therefore gave up deer hunting till we should have rain or snow, and devoted ourselves to hunting small game. One night, after we had been there five or six days, the rain came. It was one of those few occasions when I was glad to see rain. The next morning was ideal in every way for deer stalking. The leaves were well soaked, so we could move through the woods silently, there was not any wind, and it was still cloudy. "This is just the day for still-hunting," said one of the men, and indeed it was.

I went out with a son of the lumberman with whom we were stopping, and saw many deer tracks, all quite fresh, but the deer seemed to be able to prove an alibi. We went along very cautiously, expecting to see one any minute break from the tops of the fallen trees that were lying around. Finally we came to the trail of a large buck and started to follow it. Soon we came to some fresh sign, and not very much further we came to a little brook he had crossed, the water being still muddy where he had stepped in it. We knew we were close to our game, and moved along with panther-like stealth. The nature of the country was such that we could see but a little way ahead, and we peered cautiously over every knoll before exposing ourselves to open view. Occasionally a partridge would get up close to us and fly off with a noise that was exasperating. Whether a deer will heed the flush of a partridge or not I do not know, but it seemed as if they were trying to give the alarm. We found some places where the buck had pawed the leaves under the beech trees, and we tried to guess his weight by the size of his hoof-prints. At length we came to a low ridge, up which the trail led. My guide explained to me that the deer was probably on the other side of that ridge "harking." We proceeded up the ridge, my heart thumping against my ribs with such force I was sure the deer would hear it and make off. Before we got to the top my guide decided that we had better separate, one to swing off to the right and the other to the left, instead of going over where the deer had. We therefore went in opposite directions for a short distance, then went over the crest. Very soon after we went over we started the buck. I caught a glimpse of him as he ran quarteringly past my guide, and heard his rifle crack. I could not see whether the buck fell or not, but the guide held his rifle at his shoulder a few seconds, then called to me that it was down, and started to run toward it. I hurried to the spot, and was much pleased to see a fine six-prong buck lying prostrate on the ground. Then came the work of dressing it and carrying it out to where we could get it with a horse. We tied its legs together and put a pole through them, and took it on our shoulders. The going was rough, and it was after taking many tumbles that we got it down to an unoccupied shanty, where we hung it up to get next day with a horse. By the time we got it to the shanty it seemed to weigh nearly a ton. We sat down a little while to smoke and talk it over, then began our long walk home.

Deer are not so plentiful in the Adirondack region as they should be, and must ultimately disappear entirely unless given proper protection. True, in some localities they are fairly numerous, but on whole they are not holding their own against the army of hunters. The non-hounding law is a step in the right direction, but should be made permanent, not for five years only. In my judgment, the open season should be from Oct. 1 to Dec. 1, instead of from Aug. 15 to Nov. 15, as it now is. All the laws that can be enacted, however, will avail nothing if not enforced. Dogs are still used in the Adirondacks to run deer, and although many people there are hostile to it, they do not like to complain, because it is a very mean thing to do—at least it is generally considered mean.

I hope the time will soon come when we will have game laws that are just and fair to all and that they will be enforced to the letter.

F. L. DECKER.

Three Turkeys at one Shot.

THE old-time stories of wild turkey shooting are not surpassed by the actual occurrences of to-day in the same line. John Gatlin was in the city yesterday with three fine wild turkeys, averaging in weight about 9½ lbs. each. These turkeys were shot by Mr. Gatlin at a point below the mouth of Swift Creek, and were three of four turkeys in a single bunch. The best part of the shooting was that these three turkeys were all brought down by a single shot by Mr. Gatlin.—New Berne (N. C.) Journal.

Maine Game in Boston Markets.

BOSTON, 1899.—For a long time it has been perfectly well understood by persons interested in the matter that an unusually large quantity of venison was being received in Boston. Venison may be legally sold here in the winter season, though illegally killed in Maine and shipped out of that State contrary to law. Jan. 1 the close time begins on Maine deer, and the penalties are heavy for having in possession, whether in transit or otherwise. Shipments of game are forbidden by the statutes of that State, though the hunter returning may bring out his one moose, one caribou and two deer in a season; properly tagged and marked with his own name, but not otherwise. It is a punishable offense to bring game out of Maine for another. These non-transportation laws were designed to prevent deer and other game from getting onto the Boston and other markets. But early in September last year—the open season does not begin till Oct. 1 on deer, and not till the 15th of that month on moose—deer began to come into the markets here, and by the last of the month I had noted more than twenty carcasses of venison. The salesmen did not deny to me that it came from Maine. Before the 15th of October at least one moose had been in this market, known to have come from Maine. Ever since these periods venison has been a drug here. Tuesday, Dec. 6, I counted twelve fresh arrivals of deer in and about Quincy and Faneuil Hall markets, and on North and South Market streets. Part of this venison was in a clump of saddles, in a way that it could not have come through with sportsmen. A day or two before a couple of Maine guides, from Aroostook county, landed here with at least a moose and two deer apiece. People whom they have guided this fall say that they had three moose. They sold their venison for barely enough money to pay their expenses. I am told that they are registered guides, and if the Maine Commissioners desire their names, they can have them.

Last winter, in the midst of the Maine close season, deer were coming into the markets here in quantities far exceeding any previous winter since the non-transportation law went into effect. They come to commission houses and are sold by these houses. Later returns are made to the shippers or owners, after deducting commissions for selling, freight, etc. The Maine Fish and Game Commissioners, when here attending the Sportsmen's Exhibition in March, were apprised of what was going on, and immediately Messrs. Stanley and Oak began investigating the matter, and they then unearthed a system or systems of underground railroad, big game shipping business, very cleverly planned, and sufficiently intricate to greatly interest them, or anybody else, even not interested in game protection.

They first called personally on some of the principal receivers of this venison. They found them gentlemen, and really somewhat interested in the preservation of game in Maine. They have also the word of honor of some of the principal receivers of this game, prominent in their business, that they will do all in their power to break up the practice of shipping game out of Maine in close season; everything that they can honorably do that is consistent with business principles. They express themselves emphatically that they much prefer nice, fat venison in season to the stuff that was then coming—"All hair and bones," as one of them expressed the case at that time.

The shippers of this venison out of Maine, illegally, may rest assured that the commissioners of their State are getting "on to" their methods, and that they are nearer to detection than they may be aware of. If suddenly they are called upon at any time to settle for their illegal shipments, by officers in their own State, they need not blame the FOREST AND STREAM for not having given them fair warning.

Thirty saddles of deer were received in Boston, March 19. None were addressed to a firm dealing in game, but to shoe dealers, dry goods dealers, druggists—friends of the dealers in game. Once in this State the game comes to the dealers here, from these friends—legally—and they see no way but to sell it. Invoices will come a few days later, through similar channels, but not mailed at the post-office where the shipper lives.

Indeed, so well planned is the "underground railroad" for shipping Maine big game in close time that not even the checks of the firms selling it are made out to the name of the shipper, but the checks are "swapped" around till traces of that sort are covered. In some cases the shippers are so cautious that they do not permit the firms selling the illegal venison to address them by mail, lest the firm name on envelopes should lead to detection. Checks in payment are not to be sent in the envelopes of commission men; the State of Maine backwoods postmasters being pretty sharp.

Provision men tell the Maine Commissioners that some years winter venison is fairly good, but last year it was extremely poor. The remarkably deep snows in the big game country prevented the animals from getting food. Dealers would much prefer good fat animals in open season, such as they could keep in cold storage, but they cannot prevent foolish shippers from sending in that which is undesirable. They are aware that every poor and undesirable deer or moose killed takes away one chance or even more of their getting good ones. They say that they are obliged to sell undesirable goods that come to them, for the reason that others will if they do not, and trade will be lost. They are obliged to take the "bitter with the sweet." The shippers have been repeatedly advised that the market is being greatly harmed by the poor stuff creating the impression that venison is always poor.

The Commissioners found that the methods of the shippers are peculiar and well planned. They rarely ship by the same conveyance more than once at a time. Schooners bring in an invoice; the next one will come by steamer; then another by rail. They pack in many varieties of ways. Frequently the saddles are hid in the middle of barrels of vegetables, with holes in the heads or staves, showing the vegetables plainly.

Sometimes the venison is in the middle of boxes of other meats, such as mutton, lamb, or veal. Then egg cases are employed, with even a few eggs that show from the outside. Every possible means is employed to get the venison out of Maine. This is not pleasing to most of

the dealers in game here, and they would gladly give information that would lead to the detection of shippers, but for the fact that they consider it dishonorable to give away business transactions. They say—some of the best of them—that they will gladly join with others in adopting some means to stop the illegal shipping of venison out of Maine; in creating sentiment that shall lead to the stopping of the business altogether.

Later last spring it seems that "something was given away or let drop," for Warden French captured a lot of venison in the hands of shippers, in the neighborhood of Wesley, Washington county, and traced the shipment of fifteen saddles of venison to Boston March 12, which corresponds with the receipt of about the same number of saddles received here a few days after; and concerning which the Maine Commissioners were soon after informed. The same warden then discovered the shipment of about thirty saddles to Boston March 19, which will account for the same number of saddles received in Boston a few days after, mentioned above, and concerning which the Commissioners had information as noted above. Some good work was put in last spring by the Maine game wardens in stopping this terrible shipment of game to Boston, but this fall, even before the open season on deer, the shipment began again, as noted above. I cannot learn that any special effort has been made this fall to stop the shipment. The business has grown this fall with rapid strides. As I have already stated in the FOREST AND STREAM, Boston markets have been ornamented with Maine deer all the fall, and a good many moose have been here. I have taken pains to write the Commissioners of at least one moose case, and laid out a plan of detection of the shipper which seemed to me feasible. I have not yet learned that the shipper has been detected. At one time in November every store or market window in Boston of any pretensions had one or two deer strung up in it, as an attraction. I then stated that 1,000 deer would not more than cover the number on sale in Boston. Since that time not as many deer have been in sight, for they have been put into refrigerators. Still a great many are to be seen. The last days of December I counted one day thirteen fresh arrivals of deer and deer saddles in front of one store in Faneuil Hall market, all plainly Maine deer, some of them the largest bucks I have ever seen. In one case the brother of a certain salesman in a house here shipped from Maine two very handsome bucks to that house, and they were sold at 12 cents a pound whole, when venison was generally bringing but 10 cents. I know of two Boston sportsmen who could not get away for a deer hunt in Maine this fall, but each has had a deer in cold storage, from which he could cut as desired. They tell me that the deer were sent them by friends. In one case I am sure that the friend is a registered guide, for the receiver of the deer told me so, but declined to give me his name or address. Why should he give away such a friend?

After all, for the risk the shippers run in getting venison out of Maine illegally—subjecting themselves to a fine of \$40 for every deer shipped, and imprisonment for shipping moose—they get a ridiculously small return. The winter venison sold here last year at 8 to 9 cents per pound, and one day four saddles sold at 5 cents. The saddles did not average better than 70lbs. weight, and hence the value of the deer sold in the market here was from \$3.50 to \$6. Deducting freight and carting, certainly not less than \$1 each, and commission for selling and other expenses, at least 50 cents each, and the shipper got from \$2.50 to \$4 for his illegal transaction. This fall he may have been getting more for his deer, but only a trifle more, and certainly not enough to pay him for the risk he runs of detection and punishment. To the city sportsman his proceedings look exceedingly foolish. It costs the hunter who goes to Maine from \$35 to \$50, or even much more, for the deer he kills, to say nothing about the unsuccessful ones. All this money is dropped in the State and with the transportation companies. It frequently costs from \$200 to \$300 to secure a moose in Maine, and I know of men who have paid more than \$1,000 trying to secure a moose there, and yet have not succeeded. This money goes to benefit the people of the State. For the big game of the State to be seriously endangered by market hunting that is almost worthless to everybody concerned seems very unwise. Two years more of such crust hunting and forwarding of deer to this market, followed by the tremendous shipments here that have been detailed above, will put the deer of Maine into a rapidly declining quantity.

Will the present Maine Legislature take means to stop this market shipment of deer? Or is there law enough already, and will they take means to enforce the law? The Commissioners are perfectly well aware of the shipment I have described, and yet I see by their report that they have expended but \$8,000 for the protection of game and the enforcement of the game laws, while they have spent nearly \$30,000 for the propagation and protection of fish. Whether this expenditure covers one or two years I am not aware, since the Legislature of that State convenes biennially. I have no interest in the matter beyond the desire to see the big game of Maine protected as it should be protected, and I will gladly render the Commissioners or the present Legislature any assistance in my power. Any facts I have are at their service.

BOSTON, Jan. 9.—The Maine Legislature has assembled in biennial session, and appearances indicate that the tinkering of the game laws will be the most interesting matter to come before that body. It seems altogether likely that a tax will be put upon non-resident sportsmen in some form or other. One of the fish and game commissioners at least is in favor of it. Governor Powers is pronouncedly in favor of such a tax, if we may judge by the tone of his inaugural. Treating upon the subject of fisheries and game, he said, after expatiating upon the beauties of the State, and the thousands who annually come to enjoy them:

Doubtless other and further legislation will be sought in reference to this matter, in respect to which the Commissioners will more fully inform you, but in any legislation which you may deem it proper to enact I hope you will bear constantly in mind the desirability, so far as possible, of compelling those who enjoy the privileges and pleasures of these fishing and hunting grounds, to so contribute to the expense of maintaining them as to relieve the taxpayers and the State in the near future from any further large appropriations for their benefit and support, and make this industry, if I may be permitted to call it by that name, self-sustaining.

That the guide law is a success there can be no doubt in the mind of the Governor of Maine. He says:

The guide law, so called, against which, in some sections, when it was first enacted, there were some very strong protests and clamor, has been found, after due trial, to be of great value in preserving the game, preventing fires, and furnishing strangers and sportsmen who come from other States with competent and efficient guides, and all classes now interested recognize that the enactment of this law was a wise step in the right direction.

The Governor also takes occasion to remark:

Under the vigorous and also economical management of the Inland Fish and Game Commissioners, who have so very generally and effectively enforced the laws for the preservation of fish and game, and prevented illegal hunting and fishing in close time, and in prohibited and protected sections of the State, thereby putting an end to the indiscriminate slaughter of game at any and all times, once so prevalent, the quantity of game is very rapidly increasing, and poaching is fast becoming a thing of the past.

Comment on this latter paragraph is unnecessary. As for the guide law, sportsmen who have employed registered guides can speak. As for the taxing of non-resident sportsmen, the Legislature will do well to take into consideration that more than half of the big game killed—more than half the fish caught—the past season is set down to the credit of resident sportsmen, to say nothing of the vast amount of which there is no record. The returns from registered guides show that these guides have guided nearly twice as many residents of the State as non-residents. The great number of resident hunters and fishermen whom no man has guided must be remembered. Non-residents spend fully ten times the amount of money per man in Maine that residents do. To unjustly tax them may not help the hotel and camp people, and it is possible that the railroads may have something to say.

SPECIAL.

Congress and the Birds.

OFFICE OF OFFICIAL REPORTERS OF DEBATES, House of Representatives, U. S., Washington, D. C., Jan. 7.—*Editor Forest and Stream:* In the Senate to-day Mr. Hoar secured the passage of the substitute for the House bill to extend the powers of the Fish Commission over birds. It consolidates with the House bill the measure prohibiting the importation or sale of ornamental feathers, etc. The following were the Senate proceedings in detail:

Game and Song Birds.

Mr. Hoar: I ask leave to report back from the committee on the judiciary the bill (H. R. 3589) to extend the powers and duties of the Commission of Fish and Fisheries to include game birds and other wild birds useful to man, which was referred to the committee the other day. I wish to amend it by passing the Senate bill and send it into conference. It will take, I suppose, but a single moment. I will state, in order that the Senate may understand it, that the Senate passed, after some discussion and with a unanimous vote, I think, with one exception, an act for the protection of song birds. The House has now passed an act to extend the powers and duties of the Fish Commission to include game birds and other wild birds, simply giving them a general jurisdiction over the matter, and in order to get the Senate bill taken up in the other branch it is now necessary to put it as an amendment on this bill. So I ask that the Senate bill which we passed be substituted for the House bill, and that it be sent into conference. I move to amend the bill by striking out all after the enacting clause, and inserting the text of the bill (S. 4124) for the protection of song birds, which passed the Senate at the last session.

Mr. Bacon: I am in sympathy with the desire of the Senator from Massachusetts that the bill which has already passed the Senate shall become a law, but I do not understand that in order to accomplish that purpose it is necessary to strike out the House bill after the enacting clause. Why does the Senator object to the bill which has passed the House? It seems to me it might be a very desirable measure.

Mr. Hoar: I do not object to it. I would as lief have it done the other way, by adding the Senate bill as an amendment. I think that is better.

Mr. Bacon: I very much prefer that course.

Mr. Hoar: I move, then, the Senate bill as an addition to the House bill.

The President pro tempore: The Senator from Massachusetts offers an amendment to the bill, which will be read.

The Secretary: It is proposed to add the following as additional sections:

Sec. —. That the importation into the United States of birds, feathers, or parts of birds for ornamental purposes be, and the same is hereby prohibited: Provided, however, That nothing herein contained shall be construed as prohibiting the importation of birds for museums, zoological gardens or scientific collections, or the importation of living birds or of feathers taken from living birds without injury to the bird. The Secretary of the Treasury is hereby authorized to make regulations for carrying into effect the provisions of this section.

Sec. —. That the transportation of birds, feathers, or parts of birds, to be used or sold, from any State or Territory of the United States to or through any other State or Territory of the United States is hereby prohibited. Whoever shall violate the provisions of this section shall, upon conviction in the district where the offense shall have been committed, be punished for each such offense by a fine of \$50.

Sec. —. That the sale, keeping, or offering for sale, within any Territory of the United States, or within the District of Columbia, of birds, feathers, or parts of birds for ornamental purposes, except such as are excepted in the first section of this act, be, and the same is hereby prohibited. Whoever shall violate the provisions of this section shall, upon conviction, be punished for each offense by a fine of \$50.

Mr. Hoar: In line 8, section 3, where it reads "such as are excepted in the first section of this act," it should read "the preceding sections."

The President pro tempore: The amendment to the amendment will be stated.

The Secretary: In section 3, line 8, strike out "first" and insert "preceding," and strike out "section" and insert "sections."

The amendment to the amendment was agreed to.

The amendment as amended was agreed to. The bill was reported to the Senate as amended, and the amendment was concurred in. The amendment was ordered to be engrossed and the bill to be read a third time. The bill was read the third time and passed. Mr. Hoar: I move that the Senate request a conference with the House on the bill and amendment. The motion was agreed to. By unanimous consent, the President pro tempore was authorized to appoint the conferees on the part of the Senate; and Mr. Hoar, Mr. Teller and Mr. Bacon were appointed. FRED IRLAND.

A Missouri Outing.

Our little club of royal good fellows have just returned from a ten-days' camp on Little River, in Dunklin county, Mo.

We left the railroad at Kennett, and went in wagons six miles to Coker's Landing, on New River. Here we employed boats, into which we piled our camp equipage and ourselves, and going down New River about two miles we came to its junction with Little River, and we turned our boats up stream for a distance of about twelve miles. We passed through what was called the Willow Shoot, where the water runs like a mill-tail for a distance of some four miles, and the royal work we had to do was enough to prove that we were made of heroic stuff that did not flinch before difficulties. We succeeded in reaching Snake Den Camp in good time, and got everything in good shape for comfortable quarters in camp, and then we began to inspect the territory to see what our chances for sport would prove to be.

The water was up high. The river was out in all the low lands, and we soon saw that we were surrounded by water on every side. But, as we were equipped with gum boots we boldly waded in. After a wade of about two miles we came upon a big "deadening," where we found such droves of turkeys as were utterly confusing. One of our boys got so bewildered that out of eighteen shots he killed but two turkeys, and every shot should have been effectual. The turkeys were on every side of him, and in nearly every tree over him, and flying back and forth before his eyes.

We got nineteen of the bronze beauties, and had a royal feasting season in camp for several days. Some of the boys were specially anxious to kill a deer, and to that end they waded those sloughs for miles around. They saw several deer, and got some reasonably fair shots at some of them, but they failed to ever bag their game.

Just above where we were camped is a magnificent range for ducks; and, of course, we could not fail to take that in. We killed lots of ducks and squirrels, and when these were added to our turkeys we had royal entertainment.

There is no doubt that Little River offers to the sportsman a place for genuine pleasure for many years to come. The vast wilderness of swamp can never be anything else but a range for game. Wild turkeys are in great abundance, deer are also plentiful, and there are few better places for wild ducks and geese.

Our entire crowd counted themselves well paid for their trip in the sport they had, and the pleasant renewal of annual fellowship in camp. J. N. HALL.

FULTON, Ky.

Notes on Iowa Game.

DURING the season of 1898 game has been unusually abundant in northern Iowa.

The season has been dry and hot and favorable during hatching and breeding time for prairie chickens, and as a consequence they have been unusually abundant; although as a rule sportsmen have not been able to secure any of the "old-time bags." One of the main reasons for the small bags reported is the many large cornfields which the chickens have learned to frequent for protection.

A very large amount of corn still remains unhusked in the fields; and many of these fields the chickens are now (December) frequenting in flocks varying in number from five to more than 100. The presence of these large flocks with us is indeed a most pleasant sight to all the old-timers who remember so well the myriads of prairie chickens which inhabited the country in early days.

Sometimes a large flock of chickens are seen to fly over, and sometimes alight almost within the borders of the town.

Quail have also been unusually abundant this year all over northern central Iowa, and portions of central and southern Minnesota. They were favored, like the prairie chickens, with a dry, hot season, and have thus rapidly increased in numbers.

They are seen more frequently around artificial groves surrounding former homes, and along hedges which border roadways, rather than in the main bodies of native timber.

The present game law has worked well in aiding to protect this splendid bird; but more has been done by the farmers themselves, who rarely permit this bird to be shot on their land, and who generally in other ways do what they can to protect and preserve them.

Ducks and geese have been a "good crop" in the extreme northwest portion of the State, but as a general rule have been quite scarce elsewhere in the region considered.

Rabbits are also unusually abundant, and they, together with the gray squirrel, practically furnish all the hunting the sportsman has here in winter. An abominable method practiced here, and one which no true sportsman would for a moment be guilty of, is the capturing of great numbers of rabbits by the aid of ferrets.

The method employed is to send a muzzled ferret into a rabbit burrow and drive the rabbit out and into a coffee sack held wide open over the mouth of the burrow, and then kill the rabbit with a sharp rap over the head or back with a club.

It is reported that in a swampy tract of land on the Wapsey, a few miles east from Waverly, two or three young men with ferrets captured, a few weeks ago, 500 rabbits in two or three days.

Where the object sought is the extermination of the

rabbit, then perhaps the use of ferrets may be excusable; but under other conditions it is an inexcusable injustice to every true sportsman whose equal rights should be respected.

The gray and fox squirrel (the fox is only a variety of the gray form) is also unusually abundant in northern Iowa this year, and furnishes fine sport for the hunter. Good bags are obtained where formerly it was the rule to return from a day's hunt with but few if any "tails" to show for the effort.

Red squirrels do not appear, so far as my observations have extended, to have held their own with the grays this year.

During this season fishermen have met with unusually good success with the rod, especially in the Big Cedar and Shell Rock rivers. The main catches have been black bass, pike, pickerel and red horse. In spite of the stringent and pretty well enforced game law of this State, a few "game hogs," it is reported, still persist in violating the law by the use of seines and dynamite.

CLEMENT L. WEBSTER.

CHARLES CITY, Ia.

Four Days at Quail.

CAMDEN, N. J., Dec. 19.—My friend, Mr. Jno. F. Starr, Jr., and I left Philadelphia Dec. 13 for Morgantown, N. C., arriving the following day minus our dog. Be sure to tag your dog for destination; otherwise you may meet our fate. For much to our sorrow, the dog kept on going, and perhaps would be on the train yet if it were not for the hot pursuit of telegraphy. How provoking, after giving every baggage-master instructions and extra pay for the good faith in him. Through the courtesy of the telegraph operator he overtook the first section of our train at Asheville, N. C., but too late to get the dog forwarded for the day, hence our discouraged feelings. The train going our direction was too late for the afternoon start of our first venture for quail.

We, however, had acquaintances, who came to our rescue by producing two supposed-to-be very finely broken dogs. So off we started over hills and valley. After about two miles' walk we found the little dog "Hick" smelling and trailing, when, behold, he came to stand. I signalled Mr. S. to my side, when up flew one poor lonely bird, which I understood had been sent his way for the escape of a rabbit hunter. I had not finished the charging of my gun when the dog went pell mell after the dead bird. In doing this he spoiled our sport, running into a dozen or more scattered birds. Imagine our feelings. We marked a few of them, and landed four to our credit. Over another hill, on an angle of no less than 95 degrees, we reached a fine stubble field. Off went our dogs for a sure find. No more than five minutes had expired when we saw one of the dogs standing, tail up, not down. We hurriedly came to quarters for more of it. Finally I stepped in, and up went about twenty fine big fellows. We bagged two of them. Off goes our dog, my throat commencing to get hoarse from calling to him, so finally I landed a shell of No. 8 at him; but he did not mind it. This got worse than I cared to endure, and we finally agreed to hold our dog when we found he scented the birds, allowing him limited privileges. The afternoon drawing to a close, on our way homeward we accidentally ran into a fair-sized bunch, and secured two more, making it eight for our first quarter-day.

On Wednesday the weather is fine, brisk and frosty. Off we go, repeating the same journey, with our own reliable dog. No more had we gotten out of the woods when to our joy he stood as if anxious to shoot at them himself. Up they get; there are three reports and one bird. The others go into a very dense growth of pine on one of those hills where one requires spikes to keep from sliding down. However, getting near our view of where they landed, we found our dog standing. Up goes one and down he comes. The dog still points to my left; I move backward and up get another. Down he comes. "Dead bird, fetch." But he refused to move when I urged him to fetch, and up got another bird—wrong side up—a miss. Coming in with the first bird he stands near by on point, and I score another. Finally they flew, about six in all, over the hill to another stubble, a distance of a least a mile. We came to a ditch, and as we were jumping across up flew a fine big covey, but I lost my balance and went backward into the ditch. Being unable at that time to locate where they went, I worked hard to find them, and scoured the woods with no signs. We went back to the field, and around the volcano hill; our dog stood; up went another, and another, and on a little further goes another. Well, I may keep on writing and tire you of the same thing, but I want to say any good strong man able to rough it can get all the quail shooting he wants in any part of Burke county, N. C.; but prepare for good dogs. We reached our homes amply justified with the sport and hardship, Sunday at 8 A. M., with eighty-six quail to our credit and our dog feeling the effects of it. G. E. RHEDEMAYER.

Killed by His Dog.

E. K. BLADES, one of the best known members of the legal profession in Los Angeles and an expert marksman, was accidentally shot on the afternoon of Dec. 27, and died of his injuries at midnight. Blades left Los Angeles Sunday evening for a duck hunt at Almitos Bay, near Long Beach. Blades passed most of the day on the bay hunting from a boat, with his dog as his only companion. He reached the shore about 2:30 P. M., and was in the act of pulling his boat out of the water. The dog was leaping about in the boat, anxious to reach the shore, when one of his paws struck the trigger of Blade's shotgun, which was discharged. A charge of No. 4 shot struck the hunter in the fleshy part of the left thigh. Blades gave a cry and fell into the water. The report of the gun and the cry of the wounded man were heard by the McGarvin boys, who live near by. They ran to the shore and dragged Blades from the water. The injured man was taken to Long Beach, where several doctors attended him, but he died at midnight. He retained consciousness long enough to tell how the accident happened, and to give directions concerning the conduct of his personal affairs. —San Francisco Chronicle.

CHICAGO AND THE WEST.

Big Hunts.

CHICAGO, Ill., Dec. 31.—It has been a year of big hunts. Never before in my connection with sporting journalism have I noted so many side-hunts, drive hunts and other field operations by large bodies of men. The Western Slope Hunting Association, the big jackrabbit drives of California, Utah and Colorado all come under this head, as well as countless side-hunts, attempted wolf round-ups, etc. Even in the Old World, though perhaps this may not classify under the head of Chicago and the West, the record runs into large figures. Thus I notice that a big rabbit drive took place this week at Osthausen, Hesse, in which a baron, a grand duke, a prince and a count were among others who formed the firing line. They killed 2,900 rabbits, and I presume thought they had broken the record. In the latter supposition they figured without returns from the New World, where there are more rabbits, bigger rabbits, more hunters and better hunters than anywhere else on the globe. The paltry 3,000 rabbits killed by the noble Germans dwindle into insignificance before the 4,328 jackrabbits which Parson Tom Uzzell distributed on Christmas morning to the poor at Denver, the product of his big seventh annual jackrabbit hunt at Lamar, Colo. This record is only one of several as large, or almost as large, which have been made this fall in those portions of the West frequented by the long-eared hares, which love the short grass and the cold breezes of the upper plains.

There was a modest little side-hunt at Oketo, Kan., last week, with thirty-nine men on the side. One commission firm in St. Joseph, Mo., purchased of these side-hunters 1,360 lbs. of dressed rabbits, which is mentioned as but a small part of the net results.

There was a big side-hunt, of similar nature with those above mentioned, held this week by shooters of Baxter Springs and Galena, Kan., with something like seventy guns in attendance, though I have not yet heard of the results of the enterprise. If this thing keeps up, and if also the rabbits keep up, we shall after a time have fixtures of rabbits shooting for sweet charity's sake, which in due course shall attain the social importance of the charity ball, and which methinks will be of greater benefit to the poor.

I presume I have heard of a dozen big wolf round-ups in Illinois, Iowa and Kansas this fall, but I do not recollect to have read yet of a single wolf being killed. Fort Dodge, Iowa, is the last to undertake a wolf drive. These big round hunts are all pretty much alike. A lonesome little prairie wolf comes into a farming county and kills a chicken or two. He is seen or suspected, and a hundred farmers unite to exterminate him. They have a pleasant day out of doors, and go home each with a sore throat, perhaps an aching head, but they rarely take home any wolf with them. The side-hunt, the round-up hunt and the drive hunt all seem to be institutions of civilization, and may be called the department stores of sport. In the early days in a wild country, when game is really abundant, you do not hear of any such undertaking. Each man does his hunting for himself, and he has his sport alone and in solitude. Although he may hunt for reasons other than those of sport, he is none the less typical of that amateur form of sport which has always seemed to me the backbone of national manhood, and our national sportsmanship. Yet this is a time of trusts and of department stores. Perhaps the solitary man with a gun is a passing figure on our page.

The side-hunt idea seems to be the product distinctly of the Northern commercial spirit. I do not remember to have read in my time of a single side-hunt ever held in the South. Upon the other hand there obtains in the South one peculiarity we do not note to a similar extent in the North. This is the practice of camp hunts, usually made by large parties of sportsmen. The Southerner is gregarious in his sport, but I do not think him so grasping as his Northern brother. The big Southern camp hunts are usually made seasons of jollity and good fellowship, with abundance of good cheer, good service and good sport. It seems to me that in the South, that is to say, in the States to be called purely Southern, there is much less of market hunting than in the West and Northwest. The great markets have been fed mainly from the States west of the Mississippi River, Texas, Missouri and Arkansas contributing perhaps three times as much as all the rest of the South. The scientific market-hunter, who followed the wildfowl from northern Minnesota to Paw Paw Bluff, New Madrid and Galveston, was a purely Northern product, and introduced Northern methods among a people less disposed to utilize, to the limit the bounties of nature. Sometimes such men met opposition from local sportsmen, and often they have been compelled to leave localities where they were shooting for the market. It has always been my belief, ever since I have known the South, that that region will hold its game long after the North has been depleted, and I must pay the Southern brethren of the rod and gun the compliment of saying that it is most likely among them that we shall find enduring the idea of purely amateur and temperate sport. There seems to have come down from some ancestral source in the South a very good idea of the combination of a gentleman and a fowling-piece, of a gentleman and a horse, of a gentleman and a dog. These things appertain also to the North, and they come more and more to be valued all over the West, so that we may not be accused of making odious comparisons. I am only reflecting, as I look over the record of the fall, that in the West I have heard of many side-hunts, and from the South not one.

Southern Hunting Grounds.

I have received the following communication from Mr. F. A. Whitman, of Macon, Ill., who wishes to know something about a good Southern country for turkey and deer:

"Have you any information that you are not using, if so could you spare me a little, on where to go hunting. I would like to know of a place in Arkansas, Mississippi, Tennessee or Louisiana, where a party of three or four could spend a month this winter, with a possible chance of getting a shot or two at deer, turkey and bear. We would want to camp, not stop at a hotel. I have made

five trips to Arkansas with more or less success. The last time there were two parties of us from Illinois, three in each party; we killed fifteen deer, before dogs, but there was no other game, and shooting a deer before a dog is not just the proper thing, I think. This was in January, '97, about ten miles above Clarendon, Ark."

In reply to the above, I wrote Mr. Whitman that I thought he might get good country out at Texarkana, Ark. Now comes friend Joe Irwin, of the Capital Hotel, Little Rock, Ark., with one of his interesting budgets of Southern shooting news, which I give below. Perhaps this will be of use to Mr. Whitman, as well as others. It is my wish to make this office a clearing house for shooting news, and I am always very much obliged to friends who will send information such as that given by Mr. Irwin, who writes as follows:

"A party of four of us went down to Fenton, La., last week, where the shooting on quail last year was very fine, but it had evidently been shot out the year before, as we found them very scarce. Saw millions of ducks in an open lake (Serpent Lake), three miles from Fenton, but there was no cover that we could use to any advantage, though we managed to pick up some fifty or sixty in a couple of days. En route we met our friends Dick Merrill and Frank Parmelee, going to High Island and Port Arthur on a duck and goose hunt.

"At Texarkana we also met Mr. Gray Carroll, of Little Rock, with a party of English friends, returning from a short trip above Texarkana, and they had with them four bears, eight deer and twenty-three or twenty-four turkeys, and as it should be, they were a very happy party.

"I had a little turkey hunt over in St. Francis the first week in December, and was lucky enough to kill six fine turkeys. I called them up as they are called in the spring. I carried three of them on my back about four miles, that made me quite weary.

"Quail shooting has been quite good in Arkansas this year, and ducks too, in some parts, but I have not hunted ducks much yet."

What Ails Wisconsin?

CHICAGO, Ill., Jan. 7.—Yesterday afternoon the FOREST AND STREAM office was favored with a visit from Mr. John Stevens, a wealthy sportsman of Neenah, Wis., who spends a great deal of time in pleasant trips in different parts of the country, especially in the upper part of his own State. Mr. Stevens brings some rather startling news about the state of affairs in Wisconsin. He says that the executive officers of the State entirely fail to give any practical enforcement to the non-export clause of the Wisconsin game law. I have earlier repeatedly called attention to the big game "fence" run under one name or another in the city of Milwaukee. There was some talk about the breaking up of this Milwaukee clearing house for the Chicago game markets, and without doubt a great deal of good was done, yet it would be folly to assert that the clearing house has been abolished or seriously impaired. Not only does Milwaukee act as a blind for the Chicago market, but also for the St. Louis market, the latter one of the largest and most unscrupulous game markets in the world. It is high time that the people of Wisconsin should take it into their own hands to see that the game laws are enforced in this regard, otherwise within the next five years they will wake up and find their State stripped bare, and no better than Illinois or Iowa.

Mr. Stevens was recently in the upper part of the State near Prentice, Fifield and Ogema. He was there not for a hurried visit, but for some time, and he knows what he is talking about. He told me that the amount of partridges that were being shipped from Ogema alone was something almost past belief. He said that time and again he saw heaps of partridges piled up at the station platform in piles reaching almost as high as his head. Shipments of 400 and 500 a day from that one point alone were the ordinary thing during the open season. The express company carries these birds all to Milwaukee. They go into one end of the commission houses at Milwaukee, and out at the other end into a lake boat, which carries them to Chicago. There is no reason or excuse for the denial of these facts, for they are facts. They require no comment other than the reiteration that the people of Wisconsin will do very well to wake up and get their laws enforced.

That so much game should be shipped from one little town, itself only one of many, shows that there has been a systematic and extensive campaign laid out. As a matter of fact, agents of commission houses at St. Louis and Chicago have been out all over upper Wisconsin among the little outlying pine woods towns, and have made business arrangements with local shooters to shoot steadily for their markets. It is not generally known that this plan is pursued by the commission houses, but really this is the way the prairie chickens were cleaned out of the Western country. In the earlier days the commission houses located their shooters, shipped them ammunition and put them on a working footing, one house sometimes having out a great many men. I remember that old Col. E. S. Bond once told me that he had just shipped 3,000 shells to one of his market-hunters out in Nebraska. This same systematic onslaught has been recently transferred from the Western prairies to the Northern pine woods, and the game now marked for extermination is now the ruffed grouse instead of the prairie chicken. The local shooters are paid 40 cents for each bird they kill, sometimes as high as 50 cents. The bags run from twenty to forty birds a day to each man, and the number of men is such as would startle the good people of Wisconsin were it known. A laboring man can make from \$4 to \$6 a day shooting grouse, where he could make perhaps \$1.50 a day at much harder and less pleasurable work. One man said he had shipped 1,500 birds last fall up to date, and he was still shooting, and had seventy-five birds ready to ship. This man said that he had paid off the mortgage on his farm by means of his market shooting.

You may always trust a market-hunter to know the easiest and most deadly way of killing his game. This slaughter of ruffed grouse in Wisconsin is going on in the slashings and pine woods of a logging country. The cover is very thick, and the country is hard to travel. Wing shooting would be too difficult for the market-hunter, nor could a bird dog very well be worked. The market-hunter uses a little yelping cur dog, which trees the grouse, and the shooter has small excuse for ever

missing a shot at a bird, since he simply pots it as it sits on a limb.

It is well known to all acquainted with the Northern woods that much of the shooting on grouse is done along the logging roads, where the birds come to feed or walk around. Often very fair shooting can be had by the sportsman who simply walks along the road and does not need any dog. The habits of the grouse are known very well to these Northern market-hunters, just as the habits of the prairie chicken were known to the Western market butchers. Two men this fall put into practice one of the most deadly schemes of which I have heard. They had a two-wheeled cart, which they loaded up with wild rice and other bait, and they traveled all along the country roads and baited them for miles. After they had done this they began their work along the same roads, and are said to have killed thousands of birds. I am not in the least attempting to be sensational in these statements, but they are all true and susceptible of proof. The express agent at Ogema could tell some startling stories if he could be induced to speak. This is part of the work done by these pious frauds, the express companies, who tell all the game wardens that they are in sympathy with them and want to aid them in their work. They can best aid the wardens in their work by beginning their solicitude at the shipping end and not at the receiving end of the consignment.

Mr. Stevens tells me that a very common method of evading one part of the Wisconsin law is the shipping of deer in barrels, covered up under a lot of partridges. I presume that he may also have heard of the Christmas tree dodge, which has been worked to a very great extent this past fall. Each fall a great many thousand Christmas trees are shipped from upper Wisconsin to the cities, and it has long been the custom of the astute woodsman to conceal a deer or two in the car under the Christmas trees. This is a way they have of saying Merry Christmas to the game wardens. Week before last week there was one arrest made at Pembine of a man who was working the Christmas tree racket.

Mr. Stevens tells me that there is no pretense of enforcing the license clause of the Wisconsin game laws, and he expresses surprise that any one should imagine that there had been any attempt at collecting the non-resident license. He says that the only thing the non-resident hunters need do is to hire a local guide, and he does the rest. At the camp of McCartney and Boyd, near Fifield, last fall, there was one party of twenty-six Ohio men who stayed there for quite a while and shot everything they could. Mr. Stevens does not think that one of them paid a State license, and I am convinced that had they all paid they would have turned in about double the amount of money that was actually collected in the entire State of Wisconsin this year under the non-resident license clause.

The enforcement of the non-resident law in Wisconsin has been worse than a simple mockery.

What ails Wisconsin?

Southern Game.

Mr. Irby Bennett, of the Winchester Repeating Arms Company, with Mr. Charles F. Sylvester, of the same firm, made the FOREST AND STREAM office a very pleasant visit this week. Mr. Bennett went on to St. Louis from this place, but remained here long enough for a good talk about the South and Southern game. He tells me that the shooting at Wapanoca Club preserve, on the St. Francis, near Memphis, has been remarkably good recently. Mr. J. Edrington, of Memphis, on three consecutive days killed the limit of fifty ducks a day, and moreover, killed five turkeys and two wild geese. Mr. J. M. Neely killed 100 ducks in two days. Mr. W. H. Carroll on one day killed fifty ducks and eight wild turkeys. Mr. B. F. Price, the secretary of the club, killed fifty ducks on one day, and Mr. Buckingham and Frank Poston, of Memphis, have each killed the limit on several different occasions this winter. That is really a wonderful shooting preserve, and personally I always liked this club, because it sets a limit to the daily bag, which is something any shooting club ought to do in these days.

The sportsmen of Kansas City complain that the season has been an extraordinarily poor one for sport. The duck shooting was good for only a few days, the quail were shot out pretty badly, and even the rabbits did not seem to have a realizing sense of their duty. Incidentally I notice in the Kansas City Star a statement that during the last week in December the warm weather caused a great deal of game to spoil. The city meat inspector on one day condemned 43 wild turkeys, 980 quail, 423 rabbits, 97 opossums, 27 jackrabbits, 127 ducks, 11 geese and 180 lbs. of venison. Perhaps this is where some of the Missouri game had gone.

Warden Loveday has been getting into the profound dislike of the St. Louis commission men, as it is reported that he has seized several thousand quail intended for the St. Louis market.

In the North.

The wardens of upper Minnesota are having lively times trying to stop the illegal killing of deer by men who hunt for the lumber camps. In the neighborhood of Soltan Springs there have been a number of arrests of the yold hunters. Henry Swenson, John Wade and Edward Orloff are among those who have got mixed up with the meshes of the law.

Quail shooting was good in Minnesota this past fall, but the snow came early, and consequently the number of quail killed has been very large, so that some of the sportsmen fear the supply has been badly cut down. This would be too bad, as these birds are now moving up into Minnesota in great numbers, a fact never before so general and noticeable as within the past two years. I think it undoubtedly true that there has been a general migration, or rather a general extension of the habitat in the West, of the Bob White quail to the northward. The logged-off pine lands of Michigan, Wisconsin and Minnesota are now, and will be still more in the future, among the best quail grounds in America.

E. HOUGH.
1200 BOYCE BUILDING, Chicago, Ill.

JACKSON, Mich.—I get more solid comfort from FOREST AND STREAM than from any other paper I read.

DR. W. W. LATHROP.

A Successful Maine Trip.

NEW BEDFORD, Mass.—In compliance with your requests in asking your readers to report their successes to the FOREST AND STREAM, I'll try to give the main points of my last trip into the North Woods in search of moose. In company with W. M. Stowell, of Dartmouth, my partner of last year, and C. O. Wing, of Westport, we arrived at Swett's Camp, on Lake Sapomeag, Oct. 1. This lake is seven miles in the woods from Oxbow, Me., surrounded by hills and hardwood ridges, making it a picturesque spot amid the most magnificent scenery. Several streams in the vicinity abound in trout. We spent a couple of weeks roaming the woods, endeavoring to locate the most favorable places for calling when the 15th should arrive. It finally got along, bringing with it a thick snowstorm. In the afternoon we started for our chosen spots.

Mr. Wing and his guide, Bert Willard, went up the lake about three miles. Mr. Stowell went over to Carry Branch, three miles to the west, while I started for deadwaters in the north, I went alone to the canoe about a mile from camp. Stowell was to follow in the course of an hour with the camping outfit. I sat down and had a smoke, when all at once I heard a grunt, a bellow and a crash. It did not take me long to locate the sound and to decide that if the moose kept his course in less than thirty seconds I would be face up to a big bull. On he came at a smashing gait down an old logging road. Just across the stream he hove in sight inside of 50 ft., and stopped looking right at me. No one but a moose hunter could begin to appreciate that supreme moment. All the different anxious thoughts that have been chasing each other in mad riot through your seething brain are stilled, the blood that has been rushing and roaring in your ears and making your heart beat as never before has frozen. You are simply carved from stone. All thoughts of the world and yourself have vanished. The critical moment has come. I pity the man who is subject to that common complaint called buck fever, for his chances are slim.

I raised the old .45-90 and taking careful aim placed the ball at the butt of his neck, and as he was standing a little quivering, on through his heart. He simply wilted in his tracks, as dead as a hammer. With exultant thoughts I crossed the stream, to gloat over my prize. He was a beauty, and no mistake. Then I started for camp; on the way I met Swett, and told him of my good luck, and of course he was tickled.

Mr. Stowell came into camp next morning, and after congratulating me in a hearty manner, told of experiences that a tenderfoot is rarely favored with. A cow moose began to call about 3 o'clock, about 500 yds. away, and until dark it was "which and t'other" between Stowell and the cow, which could make the most noise. Before 8 o'clock they had called up four bulls and a cow moose. One of the quartet met the calling cow, but none of the rest cared to come to Stowell. They hovered around for several hours, but notwithstanding all Stowell's persuasive eloquence on the horn, none came in sight. Stowell got no moose, but he had an awful lot of fun that night. Mr. Wing got a small moose by tracking on the snow.

We hunted deer with good success, as they were very abundant around there, anywhere from five to twelve being seen most any day. We came out of the woods the 25th with six deer and two moose, having had a great time. To anyone desiring full information in regard to a good location and a competent guide, I will be most happy to supply both.

MICHAEL SHEA.

Maryland Night Shooting on Ducks.

STOCKTON, Worcester County, Md., Jan. 5.—*Editor Forest and Stream*: This year the wildfowl have been unusually plentiful, and it has been a pleasure to watch the great drifting beds, and the almost countless flights as they pass from one feeding ground to another. Red-heads, bluebills and geese have been killed in numbers not before reached for years, but the brant have behaved very badly. So far we have been unable to break up the great bunches of brant, and as a consequence the decoying has been very poor and but few have been killed. We have had plenty of rough weather, and the bays have been frozen over twice already. The ducks, however, stay with us, and their numbers continue to increase from the Northern birds coming in. In a few weeks the Southern flight will be moving, making the prospects good for plenty of game, and fine shooting will be had until late in March. For several weeks the weather has been too rough for night shooting, so the fowl have not been frightened and decoy well. If this fine shooting were stopped we would have plenty of fowl and good decoying. Night shooting is done very openly here, no one thinks of hiding his outfit or making a mystery of his going out. I am informed, on good authority, that a warden not a hundred miles from here not only shoots at night, but furnishes an outfit for another party to shoot on shares. If the State game warden would do better work on the coast, and give a little more attention to the wildfowl, and a little less to a few stores around the city, much good could be done.

O. D. FOULKS.

Not all of Hunting to Kill.

* * * or worse still, they go out with the idea of killing—no matter what nor how, just so they kill and bring in a big bag.

Which, in passing, is not sport, but mere lust for blood and lacks every element of the keen joy one finds when they have learned to read as they run from the great book Dame Nature pages day after day.

It is this element of love for the outdoor creatures that is so strong in Rowland Robinson and his associates who write for FOREST AND STREAM, and to that is due the high regard held for the paper in the hearts of the old line sportsmen (not "sports") who have the eye to see the great beauties in nature, and the minds which are broad enough to go to the wilderness for other joys than the mere lust for blood. In other words, one head of game fairly stalked and fairly killed with a clean shot, amid the setting of any of nature's pictures, gives a keener joy and a sense of satisfaction and power not to be procured through a big bag and a hot gun. As an exponent of this great principle, I say, "Long live FOREST AND STREAM."

EL COMANCHE.

Good Night, Old Pipe.

By G. H. K.

Good night, old pipe, our smoke is o'er,
Your mission faithfully done;
Don't ask me why, you know it well,
It's January 1.

A new resolve? Sworn off, you say?
Although a slave of thine?
You and I must strangers be
Through this year—'99.

You've served me well, my dear old friend,
And as I part with thee
You bring up scenes which to my heart
Most dear will ever be.

The camp-fire, with its cheerful glow,
The faces, stories—aye,
A thousand fancies to my mind
Which cannot fade or die.

The river, with its roaring falls—
I hear their music yet—
The mighty struggle with the king
To bring him to the net.

The weight—5lbs. 2oz.—yes;
A handsome trout was he;
Again you've taken me far back
That charming sight to see.

The hunt; the chase; the long chance shot;
The satisfaction—all
Come back through your mysterious power,
You necromancer small.

Your curling rings of smoke bring back
The happy days of yore;
And dear old friends, whom you and I
Shall see on earth no more.

But we must part—good-by, old friend—
And as here now I take
A last look at your tempting form
This solemn promise make:

That as I place you from my sight
(What blurs my eye, a tear?),
We'll view these scenes again, old friend,
The first day of next year.

Hunting Licenses for Maine.

In his report of Jan. 3 to the Maine Sportsman's Fish and Game Association, Secretary Farrington discusses the project of a hunting license as follows:

I desire to bring to your attention at this time what seems to me of importance for the future welfare of our fish and game interests. To my mind the time has come for a departure from the former policy of the State in providing for the care of our large game interests. While I have always opposed a license tax law, placed upon non-residents, and would do so now, unless the law was made general in its application, I fully believe that the large game should be protected and cared for by a tax upon those who wish to hunt and kill it. My reason for this is two-fold. First: The State has now to stop and consider just what appropriations are absolutely needed for the actual necessities of the State; that all demands for money which can legitimately be diverted, or where its benefits are not commensurate with the outlay, will be met in some other way, or refused.

Second: To consider if it is necessary to provide for the care of our large game, by direct taxation, or if it pays the State to longer do so, and whether its care cannot be better provided for by adopting another policy. This proposition is expected to be received with hesitation, for we have been accustomed to regard such measures with more or less distrust. My reasons for this view are given in brief, that you may see whether there is sufficient force in them to warrant your consideration.

Why I place this departure upon large game is, that its benefits to the State are less, and widely separated from the fishing interests.

In this connection I want to call your attention to the facts contained in the report of the Fish and Game Commissioners, for the year 1898, just submitted to the Governor. There was expended during the year \$29,632.27, which covers all expenditures of the board, for warden service, attending and advertising hearings, fees of prosecuting attorneys; in fact, all the expenditures of the commissioners. There can be no question but that the amount mentioned was made to go as far as it could, in the care of our game and fish, and that never has the State had the work of this department done with greater zeal and success than has marked the present administration of its affairs.

A careful analysis of the accounts show that \$21,632.27 has been expended for fishculture and matters immediately connected with the fish interests, and \$8,000 for the protection of large game.

The report also shows that according to the report of guides, there were guided 5,820 resident and 7,366 non-resident persons in both fishing and hunting—or 13,186 persons in all. How many of these were in the pursuit of large game? This question cannot be definitely answered, but from the best information attainable the number cannot exceed 2,000 non-residents and 3,000 residents. This gives evidence that the fishing interests are the important interest from which the State receives its chief revenue, for it must be remembered that there are many thousands, residents and non-residents, of those who fish, not recorded as being guided. Thousands of our citizens, who never hunt large game, do more or less fishing in all parts of the State, and the non-resident class, who are attracted to our State by its fishing privileges, not only remain in the State many months, and but few frequent the forests for large game. Our fishing privileges cover all parts of the State, and the thousands of cottages and summer hotels upon the shores of our lakes, ponds and streams give business to many of our citizens and add taxable property to the State. It also gives life and being, and lucrative business to scores of steamers and small boats who attend to their wants.

This cannot be said of the large game interests, the

great domain of which is in unincorporated places, and the lodges and camps inexpensive and beyond the reach of the tax collector.

The report of the guides as to the numbers hunting and fishing, which have been guided—the most reliable data we have—must not be supposed to give a less number than actually frequent our forests for fish and game.

But let us get a little closer to the question. For the care and protection of large game \$8,000 is expended annually, to allow 2,000 non-resident and 3,000 resident sportsmen to hunt our large game, for less than three months in the year. The State has about 160,000 adult male population, and of these 3,000 do more or less hunting of moose, caribou and deer. The State has little trouble in protecting our fish, its main difficulty is to protect our large game for the hunters who kill it. Did it ever occur to you that this is only about 2 per cent. of the male residents of the State? That nearly one-half of these are guides? That ninety-eight out of every hundred of our citizens do no hunting? That we expend \$8,000 annually that these two out of each hundred may hunt our large game? I am aware that my attention will be called to the fact of the employment it brings a thousand and more guides, who get large pay for their guiding, and that to camp owners and remote hotels, railroads and carrying companies, there comes considerable revenues. Admitted. But this proves that the results are sectional and individual in their benefits. I have often heard people express wonder and severely criticize railroad companies for not being more liberal in their treatment of the game question, in contributing money for this and that use, but no longer will it need be regarded as strange when you consider that only 2,000 non-residents come into the State for hunting purposes. It is the fishing, our grand mountains, lakes and sea shores which give the main attraction to the tourist. Let us go further. It is true that 1,000 or more guides receive two or three times as much pay as the common laborer for their work. But is the State to appropriate money to make employment for a class of its citizens that they may get large remunerative wages? One particular class? Where else in this direction does the State look out for its wage earners by appropriating money to establish business? A business which does not accrue to the general good of the State.

But the proposition I make will not in any way hurt or lessen any one of all these interests now benefited. I would not urge it, did I not fully believe it would advance all these interests, and give permanency and stability in the care of our large game.

Without any fear of successful contradiction, I say that with the \$8,000 expended annually for the protection of our moose, caribou and deer, there has been and can be only a show of protection. Thousands of our deer are killed in close time, and there is little gain in putting a stop to it, nor can there be with the money expended. This is no fault of those having this business in charge but the outcome of having this game in the great forests of the State, scattered over millions of acres of unbroken townships of wild lands, where wardenship must be limited, and effective enforcement impossible with a force of less than a dozen wardens. The fact must be recognized that the very men whose own interest and the interest of the State require its care are, as a class, not in sympathy with the enforcement of the law for large game protection. My wonder is that the fish and game commissioners have not been utterly discouraged—less courageous men would have been. It is a humiliating spectacle to see the laws of the State on large game violated as ours are and to my mind the State should adopt a policy which would provide for their better observance and enforcement.

The suggestion I have to make, is to have a law providing that all non-residents who wish to hunt moose, caribou or deer, pay the small fee of \$5, and the resident sportsman \$2 for this privilege, and have the right to send their game to their homes. The non-resident could not regard the law as onerous or partial, for they would realize that the distinction was proper, for the citizen sportsmen in common with others of the State own the game, and have to pay taxes to maintain the fishing interests. The right to send their game home of itself would be worth the amount charged. If the privilege of taking the State's game, the value and the pleasure, is not worth this to whoever hunt it, had it not better be left alone? Let the State give its attention to the care and propagation of its fish. This pays the State in all directions. Let its appropriations be greater than before, and soon all waters in all our towns will be inhabited by such food fish as will be suitable for them. This will be for the general good. The \$8,000, if diverted to such use, would soon make fish abundant in all parts of the State. The people of the State who pay the taxes are outside of these hunting grounds, and not one in 100 of such ever hunt the large game of the State. Put the money where it will do the most good and accrue to the benefit of those who support it, and let this large game matter be taken care of by those who want to hunt it, till it can be shown that it pays the State to do so itself. The proposition is just and equitable, it will relieve the State of this burden, and not keep all interested as well as the commissioners upon the "ragged edge," at every session of the Legislature. The amount thus received would be twice that now expended, and give better protection than ever before.

The idea that the State should expend large sums of money to enforce the law against men who hunt our game and want it preserved—men who, if they were loyal to the State's interest and true to their own, no money would be needed for this purpose—seems to me impolitic and unwise.

Having done this, I would go further, and separate the work of the Fish and Game Commissioners. By force of conditions, they are not to be considered together. Let there be one of the board, named game protector, to have the supervision of the game and its protection, and the other two, the affairs pertaining to the fishing interests. Each may be advisory with the other, and each interest will have the undivided efforts of those in charge. When the "shore fisheries" were made distinct from the inland fish and game supervision, it was thought by many that it would be to the disadvantage of both, but the result has been of advantage to each.

In all States where a tax license law upon those who do the hunting (and that now applies to almost all States where large game abounds) it has worked well, and every year it becomes more popular. Individual effort and individual responsibility always accomplishes more than divided effort and divided responsibility, and in this case the result can but be the same.

E. C. FARRINGTON, Sec'y.

JANUARY 2, 1899.

To Open the Season in Florida.

REPORTS of game being plentiful in the woods so wrought upon my imagination that I could scarcely wait for the season to open, but getting to the deer country seemed impossible till the Doctor used his influence to have me go with him and others on a camp hunt that was to last for an indefinite time. The Doctor, Morgan and Ben were going out with Morgan's brother Joab, who had not hunted for several years, to stay in the woods till the latter shot a deer. All of them were expert woodsmen, and I could not accept an invitation to go with them too quickly.

The afternoon we left Auburndale in two single wagons was like Indian summer at the North, with the same bracing air and sparkling sunlight, and even the animals showed how glad they were to be alive. Doctor's large bay mule, a creature with far-reaching stride, lunged ahead in a walk that lifted heavy sand-cables on wheels and made the horse pulling Morgan's wagon trot to keep within hailing distance. The three dogs, appreciating their importance, traveled with uplifted tails and received friendly advances from less fortunate curs with supreme contempt. Doctor's half-beagle, overcome with exuberance at times, bayed off on trail of wandering dogs; Old Tom, Morgan's spotted foxhound, traveled sedately under his master's wagon, while Pick Up, the black and tan fox hound, searched along the route for bones. All of us were happy.

The course from town to the place we stopped at night lay parallel to the railroad, within sight of numerous shadowed lakes, some of them in groups, and through a continuous pine wood, where the oblique rays of afternoon sun bronzed tree trunks and flashed among lower limbs. At one place we passed from this brilliancy through a deep ford, where night had prematurely settled, into more bright forest beyond.

Our stopping place for the night, near a small lake, was under a grove of live oaks, not unlike large apple trees, with gnarled limbs that were a study in curves and angles, and dense foliage very dark in color. With such protection a tent seemed unnecessary. With a supply of fuel gathered, buckets of water on hand, camp furniture unloaded, the fire burning briskly, and draught animals near by feeding contentedly, our hotel for the night was cozy. The festooned moss ceiling revealed by our fire was beautiful. It gave a flavor to our meal while at supper to study this roof at each swallow of coffee. Afterward, while the others were playing seven-up, my fat wood fire showed the surroundings.

When the cards were at last put away, and we tried to make ourselves comfortable in our bunks, I lay awake for a long while watching the nearby trees dance giddily in the fire light, and the gray beards on mossy limbs giber down at me in a peculiar manner. I heard scratching sounds among the treetops, and afterward saw illumined spots on the bark transformed into flying squirrels peering down with sparkling eyes to satisfy their curiosity, and then to play catcher, a game that was interrupted by screech owls, and once by a larger owl, which seemed to glow from a limb above the fire, to blink wisely at his surroundings for something to seize upon. The stage up there among the crooked limbs, with stars beyond, was interesting; but it was only a part of the great Florida wilderness, and somewhere off in the night the actors were larger—bears, for instance.

We ate breakfast by fire light, then passed through a town of several dozen scattered dwellings about sunrise, into a park-like wilderness, where there were numbers of browsing cattle and glimpses of lakes extending to hazy shores. Further on the deer trails that crossed the road at long intervals aroused us somewhat, and caused our hearts to throb when we saw calves of uncertain color practicing quick-steps. The mule had settled to a stride that ground out sand melodies, dogs strayed less often from their places under wagons, and our party had become taciturn—there was a long journey ahead, and everybody knew it. About midday three of the party hunted a deep bend on the left, while Joab and I followed the road with teams; later all of us raced off on a fresh bear trail; at a point near the end of our journey we shot a number of quail; these diversions shortened the day.

We arrived about 3 o'clock at our destination, a former camping place, near a small lake, recognized from a long distance by Julia with mule shouts that made the wild welkin ring with long-continued gayety, a horrible roar of sound. A large gator appeared a short distance off shore, while we were unloading, that must have been gin, from nose to eye, or gft. by the rule of the woods; a monster to be so near our water hole at night; one whose scent even was dreadful to our dogs, and caused them to carry tails with less uplift. Fear of polluting the water prevented us from shooting this brute. The outlook across the lake, extending a half-mile to saw grass and wild cane shores, backed by pine forest, was distinctly Floridian. Occasional white egrets and awkward sandhill cranes moving about from point to point, and cattle feeding along the lake shore, gave additional character to the scenery. Evidently our camping places were selected with judgment.

A stroll in the afternoon about the surrounding forest revealed the fact that deer were scarce, but that bears were plentiful. The signs of the latter were interesting. At one place bruin had climbed live oaks for acorns, and had torn off boughs as thick through as a man's arm; at another he had gathered palmetto leaves to eat their tender ends; and at still another he had dug deep for one of the large land terrapins. Our friend of the hairy jacket must be an epicure, and believe in course suppers. He observes "good form," I have heard, in various ways, such as sitting up at meals, and etiquette in upper bear-

dom may require smashing land terrapins against a stump and not on your head. He is an interesting creature. For some cause he does not frequent the sand hills in winter.

The next morning, after a chase in which all of us yelled ourselves hoarse, and Old Tom, with a recklessness that disgusted our pick-up hound, hotly pursued a bear that hung tenaciously to the thick swamp on the shore of a large lake, we returned to camp to move to a more promising deer country, twenty miles distant. The trail north of the railroad led for a time along the Florida backbone, a hilly culmination of water sheds unusually rough for this State, then through flat woods, where there were shots at sandhill cranes that approached with loud "karung-karungs," bell-like music, notes of derision when they were safely beyond range. It is said that the meat of these birds, when properly cooked, is equal to turkey—no doubt to persons with vivid imaginations. Progress was interrupted several times on the way to shoot quail, and when we stopped near a grass lake after nightfall the overcast sky caused a pitch darkness that made it necessary to hunt fuel with our feet. The tent was not set up, and when a deluge came about midnight there was wrangling of men and dogs in solid blackness awful to hear. Ben, a hero, at the first sign of light cut a tent pole.

Day broke on a dreary world. Our condition was pitiful; clothing and blankets were saturated, all of us shivered in concert with shivering dogs; mule and horse stood with heads down and feet in a bunch, taking the drenching on humped backs; a blue heron down shore croaked anathemas either at a passing kindfisher for flying so near a gentleman's topknot, or at the weather; the smaller bird answered back sharply, then lit on a snag to mope; the only living creature in sight unaffected was a large gator, that moved about over by the grass island.

When a roaring fire, boiling coffee, and food from the boxes had revived our spirits, we regarded our quarters as very cozy for such a morning. The storm abated after awhile, and three of the party went out to still-hunt, while Joab and I dried clothing. When they returned about noon with a large gobbler, shot by the Doctor, we ate dinner and resumed our journey to regions ahead, where turkeys would be plentiful and deer would run through camp. Joab and I followed the edge of the flatwoods with the teams, while the other members of our party hunted sand hills on the right. My companion had not been in that part of the wilderness for years, but he knew every cow crossing and every dead snag in the swamp to the left; while such mysteries as "upper-cut," "under-bit" and "swallow fork" on the ears of cattle we passed were easy reading, by which he identified each old sukey without hesitating. Men who have spent their lives in the woods are never dull companions.

When we came to the paradise ahead, to insure a camp that would be a credit to our party, all of us went out to select pole and stakes, then Ben cut enough light wood to fill a railroad contract. The clouds, utterly discouraged by such preparations, fled and gave place to a clear sky and shining sun. Clothing of every description was soon drying on ropes about a roar of blazing fat wood, while blankets of startling hues fought wind from the tops of saplings, and men in shocking costumes either moved daintily about the fire or danced lively can-cans on treacherous coals. It was all very picturesque.

The baying of a hound in the distance caused us, clothed as we were, to rush for stands, where we spent a breezy half-hour waiting for a deer that had passed within a few rods of camp, while we were at work. If the signs had indicated a gait faster than an amble, the impudence of passing so near us might have seemed less. Julia, the mule, had noticed the game, or something about that time, but none of us had thought to provide her with a gun. The strange dog fled at sight of us—probably to spread a report in canine circles that some very unusual apparitions haunted our part of the wilderness.

Soon after we had resumed our clothing the breeze fell and trees hushed their musical lull. No bird calls were to be heard then, no insect noises, no songs even of belated grasshopper or early rising katydid, the lowing of distant cattle being the only sounds besides our own voices. Conversation became subdued and laughter seemed impertinent. It was a time to meditate—to recall the past and plan the future—a season, in fact, for quickened fancy to think of supper. The rosy sun kissed earth adieu, then hid behind a cypress swamp. And it was night. And Morgan unmasked a skillet.

The next morning we followed the foot of the sand hills for several miles, and then crossed a wide timbered ford on the left, waist deep at places, where minnows hung suspended in the brown tinted current, and air plants grew from arching moss manes on limbs overhead. The ranks of cypress knees, bottle shape in form, many of them shoulder high, garbed with drab bark, were not unlike stunted pygmies with concealing mantles. Musical echoes of our wading came back to us there as if we were in a cavern, and the voices of my companions discussing the nosing abilities of our pick-up hound had a decided melody in them. We emerged from this into a flat country, where there were a few scattered pine trees and a number of green island-like cypress ponds in sight, the latter promising cover for game and easily surrounded.

Nearly the first of these ponds rewarded us with game. While my companions were rushing for stands, and the hounds were jubilating in the wooded pond, a deer burst from cover within range of where I stood, and after clearing with a few high leaps the surrounding belt of low palmettoes, streaked off at the top of his speed, with two reports of my gun echoing in his wake. At first sight he appeared to be huge; then seen over gyrating gun-barrels he rapidly diminished to the tiniest proportions; resolved into a gray thread after my first shot, his whereabouts became uncertain. I fired my second shot at any place in the gray line. The hounds were soon baying lustily in the swamp, quarter of a mile distant, where the game had disappeared, and afterward we found the deer there with a number of buckshot through him, dead enough after his race. That afternoon Joab made a rice purlew and Doctor treated us to griddle cakes.

Two mornings later Joab and Morgan left in one direction, the rest of us in another, and our division started a large buck near the place where I had made my kill. When we returned about noon Morgan was seen laboring

in the distance under a large deer, accompanied by Joab, who walked with a proud step, for the latter had killed his meat; an event that put an end to our hunt, but one that might induce Joab to go with us on another trip. Striking camp about dinner, and packing wagons for the last time, seemed like the breaking up of a happy family; our surroundings had become so familiar and my companions had been so agreeable that it was with keen regret I performed my part in these final preparations for our departure.

On the way home in the afternoon, through bright forest, we frequently announced the success of our trip by yodelling to log dwellings near cane fields; music that is omitted where there is no game aboard. Those Florida "cow calls" are pleasing to the ear; when subdued by distance and forest they are more delightful than thrush music. Excuse me, I am a little hoarse and cannot do justice to the following "call": "Yi-hi-i-i-e-e, yah-ho-o-o-we-oo-ow-un, yah-hay-ay-ay-e-ow-o-en, ye-hoo-oo-oo-we-e-o-on, yi-i-i, hi-i-i, ye-e-e-ippo!" That night after Morgan and Joab had parted from us on the road their cow calls came back from a great distance in cooing tones that might have been songs of sirens wooing us to a forest life; music, indeed, to dream of later at home, and to recall long after I had told my last acquaintance all about our hunt—and had astonished him.

H. R. STEIGER.

Massachusetts Game Notes.

DANVERS, Mass., Jan. 1.—*Editor Forest and Stream:* Another gunning season is scratched off of our lives as far as game birds are concerned. I think that last fall was fully up to the average. I heard of one large flock of quail seen about a week ago, and unless the snow kills them off there ought to be enough left for seed. The local fox hunters have killed more foxes this year than usual. Messrs. Beckford and Langdon are high men. Mr. Frank Killam, of Topsfield, has killed many partridges, but says he hasn't found many quail.

We have some of the best covers here for partridges of any in the State, but some four or five old worthless reprobates make a business of snaring all the young birds within about three weeks' time, and by the time a man has a chance to go out he will find old snares and no birds.

The Massachusetts Rod and Gun Club, of Boston, sent up some of their officers in the town adjoining, and captured one man and had him convicted.

The gun club I think is dead; we haven't had a shoot for nearly a year; principal cause, no suitable range. Rifle shooting is a thing of the past. We used to have a good club here; but the best shots went into the militia; then the range was transferred over to them, and now they are with Uncle Sam, and the range is going to rack and ruin.

How I would like to be in the South with the wild geese this winter instead of up here North, freezing up.

JOHN W. BABBITT.

Out for Bears.

J. L. K. sends us a recent issue of the New Berne (N. C.) Journal, in which appears this advertisement:

BEARS WANTED.

The State Museum wants two large bears—the larger the better—in good order for stuffing, prepared as follows: As soon as possible after killing remove all entrails and rub plenty of salt on inside of body, and put a lot in the mouth. Fill up the body with hay, straw, shucks or any other material that is quite dry and ship at once by express, charges collect, to the State Museum, Raleigh, N. C. We want nothing under 200lbs. weight. Will pay 10 cents per pound, gross weight, for two bears of over 200lbs. each that reach here in good condition. Money sent immediately on receipt of animal.

H. H. BRIMLEY, Curator.

STATE MUSEUM.

Gangs and Flocks.

BALTIMORE, Jan. 5.—*Editor Forest and Stream:* Noting the purist in your editorial of last issue with his fanciful grievance over the term hunting for shooting, what will he say that when a boy, fifty years ago, in Virginia, we called a flock of wild turkeys a gang of turkeys. We always managed to get one for Christmas and another for New Year's dinner. We didn't know much about Thanksgiving Day at that date down where I was raised, but were always ready to give thanks for the good things, tame and wild, that the good Lord sent us, and which we could procure by our own exertions. What's in a name? A rose by any other name—but that is worn out.

E. S. Y.

[Gang is still the approved term as applied to turkeys.]

Quail in Virginia.

CHASE CITY, Va.—Quail have never been so plentiful as this season. Sportsmen from the North who have recently visited this place pronounce the hunting the finest to be found anywhere. As many as seven deer have been found in one herd.

Polk Miller, in a recent letter, says: "I have hunted quail for forty years, and in no section of the State is the hunting as good as in the county of Mecklenburg. I find more deer, turkeys and quail there than ever before."

Chas. A. Ochen, of Baltimore, who has been coming here for years, says: "I never enjoyed a vacation more anywhere, and as for game, I consider the vicinity of Chase City a veritable sportsman's paradise."

W. D. PAXTON.

New York Forest Interests.

From Gov. Roosevelt's Message.

THE Forest Reserve will be a monument to the wisdom of its founders. It is very important that in acquiring additional land we should not forget that it is even more necessary to preserve what we have already acquired and to protect it, not only against the depredations of man, but against the most serious of all enemies to forests—fire. One or two really great forest fires might do damage which could not be repaired for a generation. The laws for the protection of the game and fish of the wilderness seem to be working well, but they should be more rigidly enforced.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

A Little of Everything.

BY FRED MATHER.

IN a newspaper now before me an unknown writer uses this quotation: "Our memories go back but a little way, or, if they go back far, they pick up here a date and there an occurrence half forgotten." This accords with my present humor, for after writing the heading of this screed I was vainly trying to recall if I first met it in the Rigvedas, the Brahmanas, or in Josh Billings' Almanac. Anyhow, the story ran that a wayfarer seated himself in a gasthaus in the ancient city of Oshkosh and called loudly for the garcon. When that person stood bowing before him in a spike-tailed coat, with serviette on arm, the hungry traveler in a foreign land looked into his "Ollendorf" and asked: "Wat kin yer give me?" The waiter sized him up. The collar had been on duty for three days without relief, he had slept in his cravat and he evidently had no credit with the barber. Therefore he cautiously replied, in order to hedge if he was entertaining an angel unaware: "Sir Knight, our larder is so well stocked that I can offer you a little of everything." Again the wayfarer consulted his book of colloquialisms and read therefrom: "A little of everything is a synonym for hash." And he declined the proffered dish.

This parable has been cited in order to warn the reader who may not incline, in a gastronomic way, to indulge in such things as hash and chowders, that this paper will be "a little of everything."

Frogs.

IN FOREST AND STREAM for Sept. 10, 1898, I wrote about "Our Frogs," and in the issue of Oct. 15 I wrote "More About Frogs." That exhausted the subject as far as my knowledge went. I proved to my satisfaction that frog culture was not practicable. A recent article in the New York Press says that Miss Mona Selden, of Friendship, N. J., bought a lot of swamp land—some 20 acres—at \$2 per acre, and fenced it in. Then she "spent the winter in reading everything she could get hold of that told about frogs, and when she wasn't reading she was out in a barn shooting at a mark with a target rifle."

The story goes on about her marksmanship and shipping frogs to New York and clearing \$1,500 the first season. Again I quote: "Then those who laughed at her went to shooting frogs and sold them to her, while she shipped them to New York at a nice profit. That was five years ago. She has since made from \$3,000 to \$5,000 a year in the business."

Mark you, there is no word of frog culture in this yarn. According to the story, she merely shot and marketed wild frogs. Do I believe it? No, my child, frogs do not attain maturity in a year, nor in four years. A marsh of 20 acres, where no frogging had been done by man or woman, might yield 30 adult frogs per acre, or 600 pairs of legs. These might weigh 40z. per pair, or 150lbs., which at 40 cents per lb. would yield \$60, and this seems to be a liberal estimate. At Blackford's frogs retail for 40c. @ \$1 per lb., according to season, and it is reasonable to suppose that 40 cents is a fair price to the shipper. A little arithmetic is sometimes good to look at. Miss Selden should have marketed 3,750lbs. of frogs to harvest \$1,500, and as it takes a large frog to dress 40z., she must have gathered in her first year at least 15,000 frogs from her 20 acres, which would allow about two and a quarter frogs to 1 sq. ft., which is a more liberal allowance of frogs than I remember to have seen.

There is something wrong in the figures of the Press, or in mine. But facts are what we want when we go out for them, and in the interest of truth it is desirable that either Miss Selden or some one who knows the facts about the frog farm at Friendship, N. J., if there is such a place, write a plain, unvarnished tale about this frog story and put all such skeptics as the writer on the way to believe in "frog farms." I will see that a copy of FOREST AND STREAM containing this article goes to Miss Selden, with a letter calling attention to it. Until then we rest.

Mr. J. H. McIlree, Assistant Commissioner of the Northwest Mounted Police, writes: "In FOREST AND STREAM of Sept. 10 you told us something about frogs, and therein say: 'The frog is a solitary animal, never in the company of another, except in the spring of the year.' I saw something so opposed to that statement that you might like to hear about it. While grouse shooting in the Cypress Hills, a range about 40 miles north of the 49th parallel, and about due north from Fort Assiniboine, Mont., toward the end of September, we always rested for an hour or two at one of the numerous springs to be found all over the hills. These springs are found well up to the heads of all the coulees running into the hills, and are all ice-cold. Around the springs and the little creeks formed by them, as long as they ran above the ground, were literally myriads of frogs. They were 3 to 4 in. in length and were green, with dark spots on the back. They were in such numbers that there was a leaping mass in front of us as we walked, and it was hard to keep them out of the springs long enough to get water. If I had read your article previously, I would have taken particular notice of them as to description, and also what they were feeding on. Pardon me, as a stranger," etc.

There is nothing to pardon. I thank Mr. McIlree for the letter, from which I will again quote, for it gives chance for an explanation. His adventure with the frogs shows that I should have added to my statement the words: "Or when about to bed in the springs for winter." In the lakes and rivers the frogs bed in the mud singly, as a rule, but the last of September above parallel 49 must warn froggie that winter is near and that he had better seek the springs, where there is an even temperature all winter, and I have seen a dozen taken

from a spring in winter, but it is temperature, and not sociability, that leads them to congregate in this way. That is the only answer I can give my correspondent.

Spring Shooting.

In the same letter Mr. McIlree writes: "I have read *FOREST AND STREAM* from its very early days, and have gathered much useful information from its pages. I have been knocking about the Northwest Territories for nearly a quarter of a century, and have seen the buffalo and other large game disappear, to my sorrow. We have nothing much left now, unless one goes far north, but a few deer and antelope, with some sheep and goats in the mountains. We stop spring shooting at ducks the coming year, and I would like to see it stopped everywhere. By reason of our climate, the duck season is short; it begins Aug. 23, and they are virtually gone by the end of October, and in some years earlier. Then they are continually shot at south of us until they return in April to breed. By what I read in *FOREST AND STREAM* it takes a lot of ducks to satisfy some men, and it is a mystery how the supply holds out. We do not shoot snipe in the spring here, but down your way I read that they are then slaughtered by the thousand."

Here is a sermon in a few words, and they are words of wisdom. If there is to be any game left in the year 1925, we must stop shooting it on its spring migration to the breeding grounds, when every pair of birds is ready to go to housekeeping and bring us a flock in the fall. Wherever moose, elk or deer are protected the close time covers the season of rut to the weaning of the fawns. Any change of these times would mean destruction to the animals. Why hesitate to apply the same principle to all game?

I have seen the prairies covered with buffalo as far as the eye could see; the wood so full of the passenger pigeon that they broke great limbs from trees, while hogs below fattened on the wounded. I have seen flights of ducks on the Mississippi that darkened the air, and have flushed a score of ruffed grouse in a day within sound of the town clocks of Albany, N. Y.

Where is all this wealth of game now? Consider the fact and the question before reading the answer.

The hide-hunter sent a dozen riflemen to follow a herd of buffalo, and only let their horses graze when the buffalo fed. They had a wagon-load of ammunition following. The shooters kept on the flank of that herd for weeks until it was shot to death. Then came a wagon-train of skimmers, who took only hides and tongues, and there ended the American bison. I speak of what I have seen, for I was on the plains of Kansas from 1857 to 1860, and have seen many thousands of carcasses festering in the sun and polluting the air for miles. Once I went on a buffalo hunt and killed one animal, when I sickened at the slaughter.*

The wild pigeon has gone, and it went suddenly. There has been an attempt to prove that its food failed; that the beech-nut no longer grew in quantities to supply the bird with food. If that was so, a few would have survived, but I say it was netting the birds in the nesting season for trap shooting that exterminated the wild pigeon. Come down on me, all you trap shooters of twenty years ago; show that I don't know the first thing about wild pigeons; call me names, if you will, and I will ignore personal abuse and give you facts straight from the shoulder. My days for physical fighting are past, yet I confess to liking a "scrap," and have some mental courage left.

Of the great flocks of ducks, geese, pelicans, sandhill cranes and other birds which went down the Mississippi in my time, much less than half a century ago, there are but a few left where I used to shoot, according to my friend, Judge Seaton, of Potosi, Wis.

It is many years since I have shot in the spring, and I will never do it again. The time has come to prohibit it in every State, but in the New York Legislature the members from Long Island will vote for any sort of law provided that the island is excepted from its provisions, and the members from other parts who want the Long Island votes on other questions give in to them. The laymen and market shooters thus carry the day and shoot in the spring.

Fish Poison Again.

A man in Millville, N. J., writes: "Your article on Skates in *FOREST AND STREAM* of Dec. 17 had an item in it about poison from fish wounds. Next day after reading it I heard of a singular case, which you might wish to record, as it is a curious one. A friend, with whom I was discussing the matter, told me that a man called 'Sailor Jack,' living at Bayside, had been stung by an eel and was blind. Of course, I knew that an eel has no sting, but to look up the matter I went to Bayside and found the man. His right name is William Edger-ton, and he lives by fishing. The case was not a recent one. It happened early in September, and this is the story, divested of his English. He was skinning a large eel and the fish in its struggles struck him in his right eye. The blow was, of course, painful, but he thought it would pass off, and kept on with his work, with one good eye and the other streaming tears.

"In about a week the smarting had given way to an aching pain, and he could not see with that eye. He asked medical advice and the doctor diagnosed the case as one of cataract, but it grew so fast and was so painful that on hearing the story of the man the physician concluded that slime from the eel's tail, impacted on the pupil, was the cause of the trouble. Did you ever hear of such a case?"

I can truthfully affirm that I never did. It "beats all my goin' a-fishin'." I've "skun" many a thousand eels in boyhood days and have seen the pelts taken off from more thousands, but never met a case like this. I hope that Mr. Mitchell will let us know how the case ends; at present the man seems to be not only blind in one eye, but is suffering. Observations of all such cases should be put on record, and I am glad to get them. No man need apologize for writing me such things because he is a personal stranger. If he has a thing of interest and hesitates about making it known to the editor, I will digest

* See sketch of Amos Decker in "Men I Have Fished With."

his facts, and if worth printing will put them in concrete form, as in this case. Many men distrust their "literary style," and fear to write what they know or have seen. As Mr. Mitchell is one of this class I told him, as I have told hundreds of others: Shoot that bugbear of "literary style;" if you have anything to tell, just write it in your own way; the editor is the man whose duty it is to straighten the kinks out of your grammar, spelling, faulty sentences and to "blue-pencil" all ornamental and unnecessary lines in your story, according to his ideas.

With that same "blue pencil" he has killed what I thought to be most brilliant jokes; he, in his reading, didn't catch the point—but we must all submit to the editor—even if I have a personal dislike to his "blue pencil." The editor and the proof-reader are at their daily grind and are not always in sympathy with the writer's thought; imagine Ruskin, Emerson, Byron and the great writers of the past subjected to revision by an editor and a proof-reader!

Charles Hallock.

The perennial and ever-blooming Hallock, long may he wave and bloom, writes me from the South, where he finds life more enjoyable than in the frigid northeastern part of Minnesota, where he went in his younger days and built the town which is named for him. Charles was, and still is, full of vim, but the day has passed when he and I could do forty miles a day on snowshoes, and our ambition to do it has died out. He writes me from Fayetteville, N. C., that he has found a delightful winter home among the pines in the southeastern part of that State, and urges me to join him, if for a week only, any time between now and May. He enthuses over the climate and says: "The water is cool, sparkling and delightful," but makes no mention of the tokay, scuppernong and other things which flow in the hills of North Carolina. He tells of tramps after game that he should write to *FOREST AND STREAM*, and of his successes in that line. All this is mentioned here to let his numerous friends know where he is, and that he is as well and happy as ever, capable of carrying his years like a man who has spent much of his life in the open air, for Hallock, like more of us, is not a spring chicken, but there is a lot of good leather in his physique.

Habits of Trout.

To the old questions: "Do the sun move?" and "Do a trout take a fly with his tail?" I have a new one. It comes from central New York in this shape: "Are trout as numerous in the outlet as in the inlet of a lake, where there is one of each? This refers to such a lake as Cranberry, in the Adirondacks, about the month of August. Some contend that when a trout runs up stream to spawn she does not return, and that in August they are moving up from below the lake. I would like to know how this would affect the fishing fifteen to eighteen miles below, say at Cranberry."

While I have fished most of the Adirondack region, I never got over in the northwestern part where Cranberry Lake lies. In a general way it hardly seems that a trout would drop back fifteen miles from the spawning ground after once starting for it. But, while individual trout in that elevated region may move to the spawning beds in August, there are others which will not start for a month later, for these fish do not all spawn in the same month. Again, there are barren trout which do not need to run up to the gravel beds, and they may move from the outlet to get warmer spring water if the outlet is cold. Some trout spawn only once in two years, and these are the "barren" ones mentioned. There are years when domestic animals are barren; hunters find a barren doe the best venison, and when in the West I found that a barren cow buffalo was the fattest and juiciest of all. These animals may not have been permanently barren, but just skipped a year. Trout are often barren, but whether any of them are permanently so or not I cannot say. Who knows? I made experiments in this direction, but they were not continued to the point of having a decided opinion on the following points. Some trout spawn in successive years; some skip a year. This much I know, but whether there are trout that are permanently barren I do not know.

My knowledge is mainly from trout bred and reared in confinement, where they can be well under observation and marked individuals can be kept track of, but I have taken trout in August in the Adirondacks which gave no sign of developing their eggs, while in June I have found eggs so far advanced that an angler who was not a fish-culturist would consider them nearly ripe. All these things enter into the question of the habits of trout, and in my opinion tend to show that there is no hard and fast rule which impels every trout to follow a rigid custom of its fellows. We are too apt to think that one individual of a species is like all others. As there is what we call "individuality" among men, so there is among animals. The owner of a dozen dogs knows the character of each one, and no two are alike, even if of the same breed. A shepherd knows the face of each of his sheep, and as they differ so do their characters. When a boy I kept cage birds as pets, and knew the faces of my different bobolinks and "yellow birds." As faces differ, so character differs, and I have seen trout of the same age, bred in the same troughs and ponds, on the same food, that at four years old showed different facial characters. A boy's face is like a girl's, it takes time to develop character, and—but this is degenerating into a lecture on physiognomy.

More Dreams.

Mr. C. L. Whitman writes from New Brunswick as follows: "In your article of Nov. 5 you wonder if others are afflicted like yourself in their dreams, and try to shoot game with a gun which will not go off. I am a fellow sufferer in this manner. Hundreds of easy shots at moose, bear and deer have come to me in dreams and I would pull at the trigger until it seemed as if it would break, but the gun would not go off. For a score of years after the Mexican war, where I was behind a gun, there was the same dream disappointment in shooting 'greasers.' Like yourself, I thought it peculiar, but I see by what others say it is a common thing. I have read *FOREST AND STREAM* from the first number, and every number, and hope you will * * * Here the taffy was so thick that the letter was 'balled up.'"

"Calm and peaceful be thy dreams," comrade, and may you have none more frightful than those you tell of, and may you enjoy *FOREST AND STREAM* for many years to come.

A Female Grilse.

CAMPBELLTON, N. B.—*Editor Forest and Stream:* As you well know, my dear father was credited with writing some very interesting articles upon fish and game life. He possessed a great deal of practical knowledge, and knew whereof he spoke, and it just occurred to me that the information I am about to convey to you would, I am sure, have been most interesting and surprising to him were he now living.

I have spent twenty-two years in the service of the Dominion Government, part of the time as officer on that king of rivers, the Restigouche, under my father's training; but for many years past I have been engaged in the piscicultural branch, and have operated many of the hatcheries in the Dominion, and think I am safe in stating that I handle and manipulate more salmon annually than any other man in America. The point I wish to make, however, is this, that in all my experience, and that of my father, I never saw nor heard of a female grilse in any of our rivers emptying into the Atlantic Ocean. The theory generally advanced is that the female does not mature and is not ready to propagate until the fourth year of her existence. But while manipulating some 400 or 500 salmon at St. Johns, N. B., this year, I for the first time handled two female grilse averaging about 3lbs. in weight, both yielding eggs. Still a greater curio, however, was an adult salmon possessing the organs of both sexes, yielding both eggs and milt simultaneously. I took about 1,000 eggs from this individual fish, fertilizing them with the milt from the same specimen. These eggs are now in the breeding trough at the Restigouche Hatchery. The results will be closely watched, and may introduce into the Restigouche a new and very interesting species of salmon. This wonderful specimen of fish was sent to Prof. E. E. Prince, Dominion Commissioner of Fisheries, Ottawa, for scientific investigation.

The hatchery is filled to its utmost capacity, and truly this has been a wonderful season on the Restigouche. Fish and game in abundance. It may well be called the sportsman's paradise. Certain New York parties have made as many as four trips to the fishing preserves and hunting grounds this season. One gentleman alone spent over \$3,000 for guides, etc., on the river. When the new Restigouche and Western Railway, which is now being built from Campbellton, N. B., through a pristine wilderness to a point on the upper St. John River, is complete, it will open up the finest fish and game country in the world, and bring the tourists and sportsmen of Boston and New York within twelve or fourteen hours' ride of the Restigouche.

ALEXANDER MOWAT.

CHICAGO AND THE WEST.

Ice Fishing.

CHICAGO, Ill., Dec. 31.—State Warden J. T. Ellarson, of Wisconsin, hands out an opinion from Assistant Attorney C. E. Whelan on ice fishing with hook and line in the State of Wisconsin, which goes on to say that the law does not contemplate the use of more than five lines to one man, or one hook to one line, and does not allow a line to remain set during the absence of the owner. This may affect a certain sort of fishing in Wisconsin rather severely. A great deal of market fishing is done on the ice in that State each winter. It is the peculiar feature of this form of work that it carries its own detection with it.

Michigan Fish Ladders.

Fish Commissioner H. W. Davis, of Michigan, comes out flat-footed in favor of fishways in dams. "It is useless," says he, "and only waste of money, to stock streams with fish if there are dams with no means for fish to get over them." These are words of wisdom.

From the Blackfeet.

Mr. J. W. Schultz, very well known to all *FOREST AND STREAM* readers through his communications from the Blackfeet reservation in Montana, is visiting a while in Chicago with friends. Mr. Schultz, it may be remembered, was the host of myself and Mr. McChesney on our sheep hunt a couple of years ago. We had a rather weird hunt then in some respects. We made a little side-hunt and carried out a small lodge, which we put up on the upper Two Medicine Lake. This lodge we left standing when we returned to the main camp, and old John Monroe said that he would go out and bring it in some time. He has never yet been able to find it, as he was not with us, and we could not direct him very closely. I suppose the little lodge is standing out there yet somewhere in the pine woods, and no doubt at this date buried a dozen feet beneath the snow.

Another little incident of our trip was mentioned in the story I wrote of it at the time. I borrowed one of old John Monroe's big steel traps and set it for a mountain lion, which had been eating up one of our sheep carcasses. John was not with me when I set the trap, and as we had to leave that country very suddenly when the team came in, I could not go out and get the trap. I told him where I had left it set, and though he never expected to find the trap, he said he would go out and try. A little later, as he told Mr. Schultz, he did go out, and found where the trap had been. Something had gotten into the trap and marched off with it, just as I supposed would be the case. I had put a good heavy clog on the trap, and John followed the trail of the clog quite a way down the mountain side, but finally lost it, it being some days old. I have no doubt whatever that I caught old Pahkukkus himself, and my only regret is that I was not there to land him, for he surely had made us plenty of trouble.

Mr. Schultz tells me that our old *FOREST AND STREAM* friend, Billy Jackson, continues in very bad health and cannot go hunting. This is news which no *FOREST AND STREAM* reader will like to hear. I presume every one at the Sportsmen's Exposition at the year of the (*FOREST AND STREAM*) Indian camp will remember the Indian baby,

Natôye, Billy's daughter. This lively youngster is now quite a girl, and there are two other Natôyes at Billy's place, both younger than she.

Jack Monroe, another FOREST AND STREAM familiar, is very well, and every once in a while goes out and kills a mountain lion or so just to keep his hand in.

Funny World.

This is surely a plenty funny world. One day twelve years ago I was out at Hutchison, Kan., and I wanted to go fishing, and I had no fishing companion. There was a tall and nice looking young stranger in town whose name was F. V. Dunham, and somehow we struck up an acquaintance and went fishing together, going over to a clear, swift little stream, known as the Ninnescah River. We caught about a bushel of great big sunfish, which we were told made the only fish supply of the stream. At last I told Mr. Dunham that it looked to me as though there might be bass in that creek. I put on a little spoon hook and almost at once caught two bass, nice little fellows, which made a lot of fun. I took several other bass during the day, and we had a lovely trip, which I remember even to-day. I did not, however, remember Mr. Dunham, and I was a good deal puzzled when a little while ago a tall, dark and handsome young man approached me here in Chicago and asked me if my name was not Hough. In brief, I found that this was Mr. Dunham whom I had not seen for a dozen years. He now represents the North Chicago Street Railroad Company in an important business capacity and is successful and prosperous. Meantime he has been to Central America as an engineer, and has had a great many interesting experiences in his busy life. Yet he has never forgotten that day on the little Ninnescah, out in Kansas, and it seems he had never forgotten me, although I was not so accurate with my memory. Now wasn't that a nice little experience? And isn't this a funny world? E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

The Kennel.

Fixtures.

BENCH SHOWS.

Jan. 18.—Logansport, Ind.—North Central Indiana Poultry Association's bench show. Sol. D. Brandt, Sec'y.
Jan. 19-21.—New Orleans, La.—New Orleans Fox Terrier Club's show. Wm. Le Monnier, Sec'y.
Feb. 8-11.—Milwaukee, Wis.—Bench show for the benefit of the Wisconsin training school for nurses. E. J. Meisenheimer, Sec'y.
Feb. 21-24.—New York.—Westminster Kennel Club's twenty-third annual show. Jas. Mortimer, Sec'y and Supt.
March 7-10.—Grand Rapids, Mich.—Butterfly Association's bench show. Miss Grace H. Griswold, Sec'y.
March 14-17.—St. Louis, Mo.—St. Louis Kennel Club's show.
March 21-24.—Chicago.—Mascoutah Kennel Club's show.
April 4-7.—Boston, Mass.—New England Kennel Club's bench show. James Mortimer, Manager.
Nov. 22-24.—New York.—American Pet Dog Club's show. S. C. Hodge, Supt.

FIELD TRIALS.

Jan. 16.—Bakersfield, Cal.—Field trials of the Pacific Coast Field Trials Club. J. Kilgarriff, Sec'y.
Jan. 16.—West Point, Miss.—U. S. F. T. C. winter trials. W. B. Stafford, Sec'y.
Jan. 23.—West Point, Miss.—Champion Field Trials Association's fourth annual trials.
Feb. 6.—Madison, Ala.—Alabama Field Trial Club's third annual trials. T. H. Spencer, Sec'y.

Westminster Show.

THE twenty-third annual dog show of the Westminster Kennel Club will be held at Madison Square Garden, New York, Tuesday, Wednesday, Thursday and Friday, Feb. 21, 22, 23 and 24.

The judges are:

Miss A. H. Whitney—St. Bernards and Newfoundland dogs.

John Davidson—Bloodhounds, deerhounds, greyhounds, foxhounds, Chesapeake Bay dogs, pointers and setters.

Reginald F. Mayhew—Mastiffs, collies, Old English sheep dogs, bull terriers, fox terriers, Airedale terriers.

J. Blackburn Miller—Great Danes (deutsche doggen).

Edward L. Kraus—Russian wolfhounds (borzois).

H. K. Bloodgood—Spaniels (except toys).

John H. Matthews—Bull dogs (except French).

John R. Buchan—French bull dogs.

Frederick G. Davis—Boston terriers.

George B. Post, Jr.—Beagles.

G. Muss-Arnolt—Dachshunde and Basset hounds.

Oscar W. Donner—Irish terriers.

Dr. M. H. Cryer—Dalmatians, poodles, all terriers (except Airedale, bull, fox and Irish terriers), pugs, whippets, schipperkes, Pomeranians, Italian greyhounds and miscellaneous.

The premium list is now ready, and will be sent on application by Superintendent James Mortimer, 1123 Broadway. Entries will close Feb. 6.

The prize list is most generous. Nine pages of the premium list are taken up with specials, distributed in various breeds. The classification this year is as follows:

Puppy Classes.—For dogs over six months old and under twelve months old on Feb. 21, 1899.

Novice Classes.—For dogs never having won a first prize at any recognized show, wins in the puppy classes excepted.

Limit Classes.—For dogs never having won four first prizes at any recognized shows, wins in the puppy and novice classes excepted.

Open Classes.—For all dogs of any age over six months. No prize winner being debarred from competing.

Team Classes.—For teams of four dogs belonging to the same exhibitor, each of which must be entered in at least one class for which it is eligible. The dogs composing team need not be named at time of entry, but simply as Mr. —'s team. In team classes the whole of the entry fees will go to the winner. Entry fee, \$5, as in all other classes.

There will be winners' classes for each sex in the following breeds, namely: Bloodhounds, mastiffs, St. Bernards (rough), St. Bernards (smooth), Great Danes,

Russian wolfhounds, greyhounds, pointers, English setters, Irish setters, Gordon setters, field spaniels, cocker spaniels, collies, poodles (curly), bull dogs, bull terriers, French bull dogs, Boston terriers, beagles, Dachshunde, fox terriers (smooth), fox terriers (wire haired), Irish terriers and pugs.

Poodles (corded), Airedale terriers, Scottish terriers and Black and Tan terriers will have one winners' class for both sexes.

Owing to the lack of support, the committee have thought proper to exclude field trial classes for pointers; English, Irish and Gordon setters, but such classes will be opened if a sufficient number of entries, five in each class, are guaranteed.

The scale of prizes runs \$20, \$15, and \$10 for first in various breeds and classes, \$10 and \$5 for seconds and silver medals and \$5 for thirds. The classes number 292. There is every prospect of an exhibition which will maintain the prestige of Westminster Show as the leading event of its kind in the world.

Special Prizes for Field Dogs.

Pointers.

The Pointer Club of America offers the following special prizes, open to members only:

The American Field cup, value \$100, presented by Dr. N. Rowe, for the best pointer in the show; to be won three times by the same exhibitor before becoming his absolute property.

The Brokaw challenge cup, value \$100, presented by W. G. Brokaw, Esq., for the best heavy-weight dog.

The Brokaw challenge cup, value \$100, presented by W. G. Brokaw, Esq., for the best heavy-weight bitch.

The Brokaw challenge cup, value \$100, presented by W. G. Brokaw, Esq., for the best light-weight dog.

The Brokaw challenge cup, value \$100, presented by W. G. Brokaw, Esq., for the best light-weight bitch.

The Brokaw challenge cups are to be competed for annually at the Westminster Kennel Club shows, and must be won three times by the same exhibitor before becoming his absolute property.

\$10 for the best heavy-weight dog, \$10 for the best heavy-weight bitch, \$10 for the best light-weight dog, \$10 for the best light-weight bitch.

Beagles.

The National Beagle Club of America offers a gold medal for the best beagle; a silver medal for the best beagle of the opposite sex to the winner of the gold medal; a bronze medal for the best beagle in the field trial class.

The Hempstead Beagles offer through the National Beagle Club of America the Pickhardt cup for the best beagle bred by the exhibitor. Cup to be competed for annually at the Westminster Kennel Club shows, and must be won three times before becoming the absolute property of the winner. Individual prize of \$10 in money or plate added. Open to all.

J. L. Kernochan, Esq., offers the Juvenile challenge plate for the best beagle in the puppy class exhibited by a member of the National Beagle Club of America. Plate to be competed for annually at the Westminster Kennel Club shows, and must be won three times before becoming the absolute property of the winner. Individual shield added.

The above special prizes, with the exception of the Pickhardt cup, are open to members of the club only.

Premium List for Field Dogs.

Pointers.

66. Puppies, dogs and bitches: \$10, \$5, silver medal.
67. Novice, dogs: \$10, \$5, silver medal.
68. Limit, dogs under 55lbs.: \$20, \$10, \$5.
69. Limit, dogs 55lbs. and over: \$20, \$10, \$5.
70. Open, dogs under 55lbs.: \$20, \$10, \$5.
71. Open, dogs 55lbs. and over: \$20, \$10, \$5.
72. Novice, bitches: \$10, \$5, silver medal.
73. Limit, bitches under 50lbs.: \$20, \$10, \$5.
74. Limit, bitches 50lbs. and over: \$20, \$10, \$5.
75. Open, bitches under 50lbs.: \$20, \$10, \$5.
76. Open, bitches 50lbs. and over: \$20, \$10, \$5.
77. Team class, best exhibit of four: Entrance fees.

English Setters.

78. Puppies, dogs and bitches: \$10, \$5, silver medal.
79. Novice, dogs: \$10, \$5, silver medal.
80. Limit, dogs: \$20, \$10, \$5.
81. Open, dogs: \$20, \$10, \$5.
82. Novice, bitches: \$10, \$5, silver medal.
83. Limit, bitches: \$20, \$10, \$5.
84. Open, bitches: \$20, \$10, \$5.
85. Team class, best exhibit of four: Entrance fees.

Irish Setters.

86. Novice, dogs: \$10, \$5, silver medal.
87. Limit, dogs: \$20, \$10, \$5.
88. Open, dogs: \$20, \$10, \$5.
89. Novice, bitches: \$10, \$5, silver medal.
90. Limit, bitches: \$20, \$10, \$5.
91. Open, bitches: \$20, \$10, \$5.
92. Team class, best exhibit of four: Entrance fees.

Gordon Setters.

93. Novice, dogs: \$10, \$5, silver medal.
94. Limit, dogs: \$20, \$10, \$5.
95. Open, dogs: \$20, \$10, \$5.
96. Novice, bitches: \$10, \$5, silver medal.
97. Limit, bitches: \$20, \$10, \$5.
98. Open, bitches: \$20, \$10, \$5.
99. Team class, best exhibit of four: Entrance fees.

Beagles.

201. Puppies, dogs and bitches: \$10, \$5, silver medal.
202. Novice, dogs: \$10, \$5, silver medal.
203. Limit, dogs not exceeding 13in.: \$15, \$10, \$5.
204. Limit, dogs over 13 and not exceeding 15in.: \$15, \$10, \$5.
205. Open, dogs: \$15, \$10, \$5.
206. Novice, bitches: \$10, \$5, silver medal.
207. Limit, bitches not exceeding 13in.: \$15, \$10, \$5.
208. Limit, bitches over 13 and not exceeding 15in.: \$15, \$10, \$5.
209. Open, bitches: \$15, \$10, \$5.
210. Field trial class, dogs and bitches that have been placed at any public field trial in the United States or Canada: \$15, \$10, \$5.
211. Team class, best exhibit of four: Entrance fees.

Sport.

DAYTON, O., Dec. 29.—Sport passed from this life before his days of usefulness should have been accomplished. He was the victim of circumstances and his friends. His decline dated from an unlucky day, upon which he went hunting with his friends, the boys, and was accidentally hit by a stone intended for a rabbit. Notwithstanding every effort of his master, he steadily grew worse until it became necessary, in order to be humane, to use the quieting influence of chloroform.

Sport's death leaves a vacancy in the society in which he moved, among whom he had no enemy. He possessed more than the average intelligence accorded to dogs, and was faithful and kind to the greatest degree. He came into the world a rollicking, fun-loving cross between a high bred Irish setter and a spirited well formed pointer; the combination not only gave him the despised yellow coat, but he also inherited the solid substantial body of his dad and the nerve and "go" of his mother. From the time he was able to run he became the constant companion of his master on the wheel. This developed his muscles to such a degree that he was invincible when it came to a scrap, even with a much larger antagonist, and with him, as with all noble natures, he never stooped to

meanness, never abused a little dog and never sought a quarrel.

Some of his feats showing endurance and speed will compare with the performance of any of his kind. He once ran over a hilly bicycle course of eight miles in thirty-two minutes; at another time he made forty-four miles in four hours; and from these trips he came in seemingly as fresh as when he went out. His speed was always a matter of wonder on account of his weight, which was 65lbs. As a watch dog he was superb, and took care of the house with rare discrimination. Those who had business were never molested, but those whom he did not know were stopped until permission was given to enter the house by some of its inmates. There will be dogs of more value, but there never will be a dog to gain and hold a stronger place in the affections of his master and his friends. C. J. G.

Curing the Grippe.

IN Rowland Robinson's story of Danvis Folks, Sam Lovel's method of curing Peltier is as follows: "I'm a-goin' tu take Peltier a fox huntin'. I believe 'f I c'n git him int'rested in 't an' hev him kill a fox er tew, it'll git him over mopin' and homin' himself to death arter that misible gal."

A few days since I was laid up to a certain extent with an attack of the grippe. After trying for a couple of days and with no apparent effect a remedy which was advised, I told the members of my family that the best thing I could do would be to go out with my dog, take a good tramp, kill a fox and cure myself. I was assured that such proceedings would be very risky. Nevertheless I put it into practice.

Yesterday we had quite a thaw, making crust enough on the snow to hold up a dog, and this morning it began snowing about 8 o'clock. It is somewhat uncertain about starting a fox on such a day, and I thought I would wait until noon before going out. About 10 o'clock one of my neighbors passed and told me that he had seen where a fox had just crossed the road about 150yds. from my house. I took dog and gun and started, and after following the track half a mile or so, the dog jumped the fox. I found the traveling very much harder than I anticipated. In the fields and open pastures the crust held me up fairly, but in the woods and sprout-land, I would go in at times over my knees. The old dog worked like a machine, driving the fox steadily something over four hours. The fox would circle about in certain places two or three times, but by the time I got there he had left. I kept on wallowing along, and was soon perspiring very freely. It was a disagreeable day to be out, and was snowing fast. My gun was covered with snow and ice; my gloves were wet and both my boots had more or less snow inside. At length, after going out of hearing twice, the dog drove the fox back into a piece of sprout-land, and he began to circle about, and I killed him. It was an old dog fox, but he had had about all the run he wanted on such a day. Head and tail were both down when I saw him coming. I got the fox, and I feel as though I had lost the grippe. C. M. STARK.

DUNBARTON, N. H., Jan. 6.

Points and Flushes.

The New England Kennel Club's bench show will be held April 4 to 7. Mr. James Mortimer will manage the show. A liberal premium list will be offered.

Canoëing.

A-Few Stray Leaves from the Log of the Frankie.

On the Wabash.

IV.

It was not a good place for the shore tent; so we decided to sleep in the canoes. So as soon as we had looked the ground over the canoes were drawn up on the bank and unloaded, and the beds made up in them and the tents erected over them; and after we had smoked a couple of pipes or so around Dave's little blaze of a camp-fire—Dave would have a fire, not considering the stove sufficiently camp-like; so at every camp he built himself a separate fire and roasted himself around it and choked in its smoke to his heart's content—we turned in for the night.

It was with many misgivings that I worked myself slowly and carefully into bed in the little 4ft. x 18in. cockpit of my canoe, and the feat was not accomplished without some little difficulty, for I had to work my two feet about 2ft. under the forward deck before I could find room for the rest of my anatomy; and even after I had gotten myself as comfortably disposed of as circumstances would permit, I felt very much as though I was laid out in a cheap, ill-fitting coffin, and found myself just about as comfortable. While I didn't exactly have to get up and go out of doors to turn over, the feat was a delicate and difficult one to accomplish, and required both time and patience. As the pine floor boards of my canoe were not long in making themselves manifest through my blankets, it is needless to say the operation required to be performed with tolerable frequency; and as I was invariably waked up at each performance, it may be readily inferred that I did not get much sleep that night.

Dave, on the other hand, in his 8ft. cockpit, with its high hatches giving him plenty of room for his feet and lower limbs, slept like a log all night, and turned out in the morning as fresh as a daisy. We also found his large, roomy cockpit, with its easily removable yet amply tight hatches infinitely handier and more convenient for purposes of packing and unpacking than my narrow little 4ft. well; and long before this cruise was ended I registered a resolution to fit the Frankie with a cockpit of similar dimensions before cruising in her again.

V.

The river was the finest we had yet had, being broad,

swift, and full of easy rapids, down which the water swung with a power and force not heretofore experienced. The rapids were particularly fine around the bend, past the old town of Lewisburg, ending half a mile below in a pretty stiff fall over an irregular stone fish dam, which we shot successfully at the only available point—just at the left of the big boulder forming the lowest point of the dam, which, as is usual in such structures, was shaped like a V, with the apex down stream.

The river swept in a strong, swift flow around the two or three picturesque rocky islands clustered at the head of the backset from the big dam just above Logansport, flowing like a sheet of transparent varnish over the golden sand and gravel a foot and a half below, and we were shot far out on the broad, lake-like bosom of the backset before the effect of the strong current was lost. We had been dreading this backset, as it was said to be seven miles long, but it proved to be not more than half that distance, and we made most of it under sail. A heavy rainstorm, which had been following us all the morning, overtook us while we were working our way through the backset, but our waterproofs kept us dry for a while, until finally the old "gossamer" which I had thought good enough to do for this trip gave way all at once in the midst of a very hard downpour, and I was soon thoroughly drenched and chilled; so we made a landing near a farmhouse and pitched the tent on a nice grassy shelf overlooking the water, the while the rain came down furiously, and I changed my wet garments, while Dave foraged for fuel. He soon returned with an armful of corn cobs from a nearby stable, and we put up the stove in the tent and had a good hot dinner. It rained steadily for three hours, and we stayed here until 5 o'clock. Our tent proved perfectly tight, and we were snug and comfortable, while outside the wind howled past and the rain dashed against the side and roof of the tent in sheets. We had intended utilizing some of our spare time in writing some letters, but before we had gotten our "after-dinner dishes" out of the way the farmer—near whose house we had camped, and who had been very kind and obliging to us—paid us a visit, followed by one of his kids, then another and another until our little 6x7 tent was crowded; and when finally the family dog arrived I thought it was time to resume the cruise, the rain having passed over some time since. So the tent was taken down and repacked, and we reembarked and pushed off. As we shoved out from the bank the old lady was observed bearing down on the camp.

On reaching the dam the canoes were portaged around the head gates into the mill race on the left bank, down which we dropped for 100 yds., when we portaged back into the river again. We found that the river had risen a foot or more since the rain, and was coming up rapidly, with the prospect of a 4 or 5 ft. rise. We also found a long series of fine rapids before us, with plenty of water, and in a few minutes we passed the head of Biddle's Island and landed in front of Logansport, where Dave went up in town after some supplies, while I remained in my canoe to watch the boats. I speedily had a group of wondering boys and men on hand in spite of the rain, which began again, and the river came up so rapidly that I several times had the aforesaid idlers lift the bows of the canoes higher up on the rocks to hold them to the shore, while points of rock, loose stones, etc., disappeared beneath the water while watching them.

Dave soon returned with his supplies, and at 6:30 in the evening we pushed off again in a drizzling rain, and under a fast darkening sky, and dropped down the rapids under the Wabash Railroad bridge and past the lower end of Biddle's Island in search of a good camping place. Eel River was observed to be looming out into the Wabash as we passed its mouth. We finally found a beautiful spot on the south bank, half a mile below the lower railroad bridge. The bank was too high and steep to get the canoes up, so we made them fast in the river below, with ample provision against any probable rise, and prepared to camp in the shore tent. The rain had passed off and the clouds had blown away, and the moon was shining brilliantly, while the wind blew great guns. Dave went foraging as soon as the camp equipments were up on the bank, while I put up the tent flat on the ground, like an A tent, without the wall, as I was afraid it would not stand in the gale that was blowing. I cooked supper on my alcohol stove inside the tent on account of the high wind outside, and after our evening pipes around Dave's brisk camp-fire we turned in and slept soundly and snugly all night, although it was a snapping cold night outside.

VI.

It is surprising how hard the floor boards of a canoe can get in the course of a night, even when made of soft pine; and my experience at this camp at Attica, where we decided to sleep in the canoes, was quite a repetition of that enjoyed at Wabash, and I cannot say that I got much if any more sleep here than I did there. We had found it convenient to pitch our camp directly under the lower railroad bridge, and about the time I would succeed, after numerous twistings and turnings, in dropping off into something like a sound sleep, a train would cross overhead with a thunderous roar, sufficient to wake a dead man, and I would find myself wide awake again. I think it must have been during this night's experience that I planned the little folding hair mattress that I would add to the 8ft. x 20in. cockpit, already decided upon during the ample time afforded me for reflection at our night's camp at Wabash. However, day broke at last, and we were out early for the last twenty miles of the cruise, for we had decided to end this cruise at Covington, and trust to the future for an opportunity to explore the lower river. We found the river falling as rapidly as it had risen, although, as it was still a couple of feet above low water mark, we had plenty of water. We dropped lazily down the river, keeping on the shady side as much as possible, past Williamsport, past the mouth of Shawnee, and in a couple of hours reached Portland, or rather what remained of it, for the old village appeared to be defunct, and a cornfield occupied its site, with here and there an abandoned old house tumbling to decay amid the corn. We laid by here for an hour for a drink of water, a smoke and a rest in the shade. While here a couple of young men, who were

running the river in a skiff from Lafayette to Terre Haute, passed us. They had camped the night before on the bar off the mouth of Shawnee Creek, and stopped with us long enough to swap yarns and tobacco. After two hours more idly drifting and paddling along the shady side of the river, we reached Baltimore Hill, four miles above Covington, where we laid by for several hours and enjoyed our noonday lunch, smoke and siesta on a shady little shelf high up on the lofty hillside, where the delightfully cool breeze vied with the charmingly beautiful landscape afforded by our elevation in making our stay a pleasant one. Finally we stepped aboard our canoes again and took up our paddles for the last reach of the cruise, every foot of which is familiar ground—or water if you choose—to both Dave and myself; and each old familiar landmark was greeted with the affection every man feels for these old friends when nearing his home after long years of absence. Around the first bend the court house towers at Covington became visible at the end of the long down-river vista. We passed inside of "the islands" for old acquaintance sake, and dallied along under the bluffs below and past the old stone quarry. We passed the Adamson ford, with its old swimming bar; dropped around the bend under the old drawbridge, whose perfect reflection in the placid waters beneath became sadly wrinkled and distorted in the little wavelets made by the passage of our canoes; and at 4:30 in the afternoon I stepped ashore at the old steamboat landing and drew my canoe well up on the rocky beach and announced "the cruise is ended."

Our arrival was expected, and we were hardly ashore before a dray and a carriage were on hand, the canoes piled on the one and ourselves piled in the other; and in fifteen minutes more we were boys again at home, the boats laid out on the grass in the front yard, the tents put up for an admiring crowd and our story of our cruise of 160 miles and seven days being told over and over again.

Yachting.

As the yachting journal of America, the FOREST AND STREAM is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

THE new rules of the German Sailing Union are interesting, as the most comprehensive and systematic attempt yet made to inaugurate a satisfactory set of rules and to keep them permanently up to the original standard. Mr. Benzon's propositions are particularly interesting to us in that they include the method, which we have for some time past advocated, of placing the racing machine in a class apart from the cruiser-racer. This is provided for, as we suggested, by means of two formulae, a comparatively simple one for the racer and one in which freeboard and other essentials appear for the cruiser. Another feature which we have advocated is the establishment of a body of experts which shall pass upon all new or doubtful features that infringe the spirit of the rule and threaten its successful continuance. No rule, however good at the outset, can be maintained under the stress of strong competition unless some such safeguard is established. The time has gone by when, after working for months to establish a supposedly better rule, the clubs will sit down quietly and watch it violated in spirit and often in letter with no attempt to protect it.

The Benzon formula for cruisers is a distinct advance on the Y. R. A. rule; the latter, through the factor of skin girth, gives no inducement to added displacement, but merely puts a small tax on the fin type as compared with the moderate S section. The Benzon formula uses the difference between the skin girth, taken by a tape laid against the planking, and the chain girth, taken by a tape or chain stretched taut under the keel and touching each bilge. This difference places a certain amount of premium on the full section as compared to the fin.

OUR correspondent Sextant praises the new rules of the Y. R. A. of Massachusetts, in that they include some essentials of a good yacht, such as headroom, floor space, etc., that are not included in any of the regular formulas of measurement. This in itself is a very immaterial point, it has never been attempted to include all possible requisites of a yacht in a measurement formula, and there is no reason why an otherwise suitable formula should be thus complicated with non-essentials. The first thing needed is a hull of proper proportions, giving space that may be utilized to advantage for living room. This much attained, it is further necessary to demand a certain headroom, to establish a minimum height of cabin house and to place plus or minus limits to various other details; it does not follow, however, that all of these should properly find a place in one complicated formula. It might be done if necessary; but it can be much better done by supplementary restrictions, which may be verified by the measurer, but which need not be carefully measured as factors of the rule. In the very important matter of headroom purely arbitrary restrictions are the best; as the required amount has no relation to the size of the vessel. A good all-round yacht of about 30ft. l.w.l. may and should have a clear 6ft. of headroom, and one of double the length needs as much and no more. Other details, of fore and aft space, go by the same standard, the height of a man, which is constant for all sizes of craft. A yacht of 25ft. l.w.l. should have one cabin about 7ft. long, at least long enough for a full berth; one of 30ft. will give two such apartments, and so on. These details at least do not vary directly with the size or racing measurement of a yacht, but must be arranged arbitrarily for each class.

The Measurement of the Length Factor.

IN reviewing the development of yacht architecture in America during the past three years, there is very little to be found that can be considered as a substantial advance. In the medium and larger classes there is practically nothing, the few yachts built since Defender (Quissetta, Syce and Kestrel) merely representing an increase of speed through a further perfection of the semi-fin type of racing yacht. Such changes as have been made are limited almost exclusively to the classes of 25ft. R. M. and under, in fact to the 20ft. and 15ft. classes that have been built up by the contests for the Seawanhaka international challenge cup.

The development in these and similar classes during 1896-7-8 has been mainly in three directions; in details of sails, spars, gear and fittings many improvements have been made, with a double gain in weight and in effectiveness; in construction many improvements have been introduced that give strength, with reduced weight, an advance up to a certain point, but the most noticeable point in this connection is the extreme reached during 1898, in which every other consideration was sacrificed to lightness and the boats were unduly expensive and utterly useless after a few races. The most important of all, however, is the altered value of the length factor, which is a vital element of all methods of yacht measurement. Beginning with a mere accidental suggestion in the Seawanhaka races of 1895, the idea of increasing the effective sailing length and at the same time decreasing the nominal length as officially measured was developed to an extreme degree in the trial and cup races of 1896, making obsolete all existing yachts of the class and establishing an entirely new type. The characteristics of this type, as frequently described in the FOREST AND STREAM, were a peculiar form and an abnormal angle of excessive heel, obtained artificially, if necessary; the result being that a yacht of little length and great beam in the upright or measuring position assumed a totally different form, of great effective length and reduced beam, when inclined to the proper sailing angle. Short of the extreme reached in Dominion, the so-called single-hull boats of the class, Glencairn II., Speculator, Seawanhaka and Challenger, all show a gain of upward of 50 per cent. in sailing length over measured length, as compared with the type of small racing yacht developed by Mr. Linton Hope and exemplified by the American 15-footers of 1895.

While opinions differ as to the true value of this peculiar development of a weak point in the rules, it has not yet been proven that it marks any material advance of yacht designing, or is other than a clever evasion of the letter of the rule. It is a very difficult matter to say how much of the great gain in speed of Glencairn I., for instance, over the conventional half-raters and 15-footers, Lotus, Kismet, Sorceress and Ethelwynn, is due to actual improvement in designing, as compared with a mere evasion of the length measurement; and whether, if the recognized disparities in effective length at the best sailing angle could be properly equated, there would be any material advantages on the side of the scow type. Important as this question has become in the small classes of open racing yachts, it is still more so as applied to larger craft. While the ability to shift a large proportion of the ballast is a material feature of the success of the scow type, thus making it less practicable as the size of the yacht increases and the proportion of live to fixed ballast decreases, it is as yet uncertain to what extent the Glencairn type may be enlarged; but a very limited knowledge of designing is necessary to prove to any yachtsman that under all existing methods of measuring the load waterline a strong inducement exists to follow as closely as possible the scow type, with its long, flat floor and hard, angular bilge.

So far as the old claims for the measurement of overhang are concerned, they have but an incidental bearing on this new question; the difficulty is one that cannot be met by a tax on overhang, unless it goes to the point of actual prohibition of all overhang at either end.

It has been suggested by different correspondents that the measurement of the waterline as now taken, in the upright position, be abandoned in all yachts, and that the measurement be made with each yacht inclined to some fixed angle; and this idea is, we believe, gaining ground as the true nature of Dominion, Glencairn and other extreme boats is being better understood. The practical difficulty, however, is almost insurmountable; it would add enormously to the difficulty and expense of measuring if every yacht had to be heeled to some fixed angle and the longest waterline at this angle marked and measured. While closely approximate measurements might be had in some cases from the design, there would still be a large number of yachts which would require actual measurement, and perhaps subsequent verification.

There is one method which suggests itself to us as both effective and easily practicable, an addition to the present methods of measuring length as found in all rules of a requirement that in case the length of any fore and aft element of the load waterline plane when heeled to some limit, say 15 degrees, shall exceed the length of the waterline as now measured, twice the amount of such excess shall be added to the waterline. Such a doubling of the excess is intended as a penalty heavy enough to be prohibitive of the Glencairn and scow type generally, while admitting on her present measurement any yacht with a waterline as full as Vigilant, for instance, or anything yet produced in the larger classes. In practical operation, the measurer could in nearly all cases satisfy himself by a mere casual inspection that the form of waterline is such as not to lengthen abnormally when heeled, so that only the usual measurement of the waterline would be necessary. If the form of the yacht is such as to cause any doubt in the mind of the measurer as to her being near the limit, it may be necessary to measure the actual waterline when heeled; but the penalty is intended to distinctly discourage such extremes and make their actual heeling and measuring unnecessary.

If it be determined that the deliberate heeling and the consequent lengthening of the waterline are desirable features, not to be discouraged, but to be recognized as admissible, provided they are fairly measured, then it will probably be necessary to measure the inclined waterline of every yacht, however difficult and troublesome such a pro-

cess may be; but as far as we have been able to judge of the general sentiment, there will be no objection to the absolute prohibition of the scow type.

Incidentally, we believe that the fairest point of division that can be drawn between different types, old and new, as discussed this year in connection with Dominion and the Glencairn type, lies between the yacht of the old V type, in which the length of waterline actually decreases as the yacht is heeled in smooth water, as shown in the FOREST AND STREAM of Oct. 8, and the scow type, in which the length increases with the heeling. Here is a logical, definite and exact point of division, far fairer and more scientifically correct than any yet suggested. It is only necessary to plot the immersed waterline at the assigned angle, 15 or 20 degrees, and to measure its longest element parallel to the fore and aft axis. If this be shorter than the waterline, as measured in the upright position, the yacht is of the normal type; if it be longer, she is of a different type and to be dealt with accordingly.

Yacht Designing.—XXI.

BY W. P. STEPHENS.

The illustrations accompanying this article are copyrighted by the Keuffel & Esser Co., New York, to whom we are indebted for their use.

There is one very important class of instruments that may properly be classed at the same time under the three heads of Ruling, Measuring and Marking; being used for the three purposes. The *compass* is strictly a marking instrument, in that it carries either a pencil or a pen; but it is also a ruling instrument, as the pencil or pen cannot be directed freely in any direction, but must move in a circle. With its marking points removed and replaced by a plain steel point, it becomes the *dividers*, a strictly measuring instrument. The *compass* is found in a variety of sizes and styles, the principal one being the regular large *compass* with several interchangeable legs, Fig. 43. The two legs are united by either a tenon or pivot joint.

Fig. 45—Bow Pen. Fig. 46—Bow Pencil.

Of the former, the *double-sector* is preferable, one leg being fitted with two steel plates, while the other is divided into three leaves of the metal of which the instrument is made, between which the steel plates fit. By means of a binding screw the joint may be made to move as freely as is desirable. Another form of good construction is the pivot joint; the heads of the two legs being clasped between a yoke forming a handle, while they are centered by two pivots with conical ends.

However constructed, the joint should move smoothly and evenly, whether the points are close together or wide apart. If this is the case, the joint may be screwed up

Fig. 47—Drop Compass.

so tight as to prevent any accidental derangement of the points in ordinary use; and at the same time to respond to a moderate pressure of the fingers in adjusting. One leg should be fitted with a hinged joint near the middle, similar to the main joint, in order that the lower portion of the leg may be held at right angles to the paper when drawing circles of large diameter.

The other leg should be fitted with three interchangeable points, each provided with a similar point. One of these should be a plain steel point, one a pen point carrying a right line pen such as will be described later on, and the third fitted to carry a movable lead, as made for lead pencils. In the older compasses, the lower end of the leg formed a split tube large enough to take a specially small lead pencil, of about one-half the ordinary diameter, made for the purpose. A newer form has a screw chuck, the same as in the pencils with movable leads, and uses the same leads. The best form has the split tube of such small size as just to take a movable lead; of good length, so as to grasp the lead without breaking it, and with a binding screw in the center of the split tube, putting an even pressure on the lead for the whole length of the tube.

The movable legs are joined to the main part of the instrument in several ways, the best being the *bayonet* or *socket* joint, Fig. 44. In this the upper end of the leg is turned truly cylindrical and fitted with a feather, while the socket is bored out to fit and slotted to take the feather which prevents the leg from turning. The next best

form has a pentagonal shank to the movable part, with a socket of similar shape on the main part and a binding screw to keep the two together.

Next to thoroughly good joints, the main requirements of good compasses are that they shall be stiff and rigid throughout, as light as is consistent with this rigidity; and shall balance well in the hand. This quality of perfect balance is most essential in *compasses*, *dividers*, *drafting pens* and all similar instruments; and is only to be depended upon in those of first-class make throughout.

The steel points may be either the long conical *English* pattern, which has superseded the old triangular points, or the *needle point*. The latter is a piece of tempered steel wire, about 3-32 in. in diameter, and 3/4 in. long, each end turned down so as to leave a very fine point about 1-32 in. long projecting from a square shoulder. This piece is held in a sleeve with a binding screw in the

Fig. 48—Beam Compass.

end of the leg. The *needle point* is considered to damage the paper less, where much work is done from one point, than the solid steel point. It is, however, more clumsy and heavy, and somewhat in the way of a clear sight in setting the instrument to any given points on the paper. For those who can handle the *compasses* and *dividers* with the delicacy which such tools really demand, the plain solid point will be found better in every way. The *compasses* are usually fitted with a *lengthening bar*, a straight piece with a male fitting at one end and female at the other, by means of which one leg can be lengthened for drawing circles of large diameter, see Fig. 43. The large *compasses* are much less used in marine drafting than in mechanical and architectural work, and for the former we should prefer a pair with one solid leg with a single joint in the center, ending in the *English* point, the other leg being fitted with a similar point, movable, and also pen and pencil points. The average size for this instrument is about 6 in., and it is also duplicated in a smaller size, of about 3 1/2 in. The larger size will sweep a circle of 12 to 14 in. diameter, with lengthening bar, and from that down to 1/4 in. or less; but it is a clumsy tool for small circles. The smaller size is intended for medium and small circles, but for the latter it is inferior to the *bow compasses*. Figs. 45, 46. In these the upper joint is omitted, the two legs forming a single steel forging with a small ivory handle on top. About the middle of their length they are joined by a long screw and nut, by which they can be drawn together, their upper parts being thin and elastic. They do not permit as much variation of size as the regular *compass* form, but they are more convenient and more accurate for circles within their capacity. They may be had with either plain or *needle point*, but each is made up as a separate tool, *bow-dividers*, *bow-pencil compass* and *bow-pen*.

Theoretically, the small *bow-compasses* will draw the

Fig. 44—Bayonet Joint.

smallest possible circle, but practically there is only one good tool for very small circles, under 1/4 in. diameter. This, the drop compass, Fig. 47, is a comparatively new tool, and differs from the ordinary *compass* and *bow-compass*, in that the whole tool does not revolve in drawing a circle, but the leg which carries the pencil or pen revolves around a stationary axis, a plain, straight leg of steel wire. As the marking leg moves freely up and down on the stationary leg, the pen may be lifted from the paper and poised clear of it until properly adjusted, then dropped lightly and swung around by the thumb and second finger, the central stem being held vertical by the forefinger. With this tool a circle may be drawn almost touching the fine central point.

In all forms of *compasses* and *dividers* the instrument should stand all possible tests that will show the two legs to be in absolutely the same plane, whether closed or opened. In the *compasses* with joined legs, the points of these legs should come accurately together when the main legs are wide apart at the top and the points turned in. In the *spring bows* the sides should be firm and rigid, whether open or closed, and the screw and nut should work smoothly and easily.

For circles over 12 to 14 in. in diameter, the *beam compass*, Fig. 48, is used. This tool consists of a bar of wood or metal of any desired length, at one end being a fixed head carrying a plain or a *needle point*. Another head, carrying a plain point, a pencil or a pen, at will, is fitted to slide on the bar; being clamped in place and provided with a screw for very fine adjustment. The only limit to the diameter of the circle is the length of bar, which can be swung and handled. This tool in a heavier form is used by machinists under the name of *trammel points*.

The Yachtsman of Dec. 22 is a double number, very fully illustrated and containing many articles on yachting subjects. We note with regret the announcement of the discontinuance of the Yachting Monthly Magazine, published by the same firm; which has become quite an addition to the regular periodical literature of yachting. It is announced, however, that the Yachtsman will be permanently enlarged in the near future.

Fig. 43—Compass with pen point, pencil point and lengthening bar.

The New Benzon Rules.

THE Danish yachtsman, Mr. Alfred Benzon, of Copenhagen, is the author of many original and ingenious propositions relating to yacht measurement, which prove him to be a careful thinker and a thorough student of the subject. The following details of a very comprehensive scheme, devised by him, and just adopted by the Deutscher Segler Verband, are given by Mr. Julius Gabe in the special Christmas number of the Yachting World.

Every rating rule is to a certain extent the outcome of some existing evil, either real or imaginary. Every evil, and as such the large proportion of yachtsmen regard craft like *Hammonia* and *Trirumph*, has been evolved by the previous rating rule. And thus the cycle of events is likely to continue its revolutions. What particular monstrosities are likely to be created by Mr. Alfred Benzon's latest rules, it is, of course, impossible to foretell. That ingenuity, running riot, is capable of finding a loophole, which has not been guarded against, is only within the nature of things. And that the framer of the new rules fully realized this fact has been amply proven by the insertion of some very cunning clauses, which invest a body of technical commissioners, as a supreme court of appeal, with practically unlimited discretionary power.

The new formula for measuring racers is not new, since it is to all intent the same as the Y. R. A. formula, which has been in force in this country for the last three years, during which period the sport of yacht racing, despite the prophetic croakings of numerous grumblers, has by no means gone to the dogs. Thus, with the aid of experiences gained in Great Britain, the new racer formula cannot be said to be an unknown quantity. The only point in which it differs from that of the Y. R. A. is the substitution of a quarter instead of a half of the square root of the sail area. Mr. Benzon's avowed object is to encourage a larger sail spread. Mr. Froude proposed to abolish altogether the tax on sail.

The idea of having two formulas, one for cruisers and the other for racers, is a very rational one. If an owner wishes to build a yacht for racing purposes only, he can do so, as under the Y. R. A. rules, without regard to scantling, displacement or comfort—for speed only. If he requires a cruiser-racer, he must conform to certain rules of scantling and comfort, a cabin is a *sine qua non* in the cruiser. The greater fullness of the vessel's underwater body, and the higher her freeboard, the less she will rate under the cruiser formula. Cruisers are allowed to compete with racers, not vice versa.

A comparison of the different values under the old (German) and the new rules shows that one old "sail unit" in the small classes equals from two to three "sail lengths" (Segel Länge, S. L., is the old German term); one old "sail unit" in the middle classes comes out approximately the same as one "sail length"; while one old "sail unit" in the larger classes equals one-half to one-third "sail length." Thus a comparison of the two values is somewhat misleading, since Comet (Thistle) comes out under the new formula as 23.7 "sail lengths" against Obersprees 12.4 "sail lengths." Their previous comparative sizes were: Comet, 15 "sail units"; Obersprees, 17 "sail units." As a rough and ready method of approximately calculating the new values, it may be taken that the "sail lengths" will number about the same as the yacht's waterline in meters. The main points of the new rules are as follows:

Measurement Rules.

A—General Rules.

1. Application of Measurement Rules.—For all open matches the sizes of the competing racing or cruising yachts are determined by the following measurement rules, the result of which is the rating, or racing value R.

2. Duration of the Measurement Rules.—The following measurement rules are to hold good in the first place for a period of three years, and should by that time no imperative reasons for an alteration be brought forward, for a further period of two years.

3. Alterations of the Measurement Rules.—Alterations of the measurement rules can only be made at the annual general meeting of the Deutscher Segler Verband, and then only by a majority of at least two-thirds of the recorded votes. Proposals for any alterations have to be made in accordance with clause 5 of the constitutional rules.

4. Technical Commissioners.—The committee of the Deutscher Segler Verband nominates on the recommendation of the general meeting for the period of the duration of the measurement rules three technical honorary commissioners as a supreme court of appeal in all questions of a technical nature referring to these rules.

5. Abnormal Constructions.—Yachts of abnormal form or construction, and yachts which circumvent the meaning of the rules though within their wording, are debarred from all open matches. Such disqualification has to be decided by the technical commissioners. The builders or owners of such yachts have the right before commencing any construction or alteration to obtain the technical commissioners' decision.

B—Measurement.

6. Obtaining the Rating.—The rating of a racing yacht is ascertained by the following formula:

$$R = \frac{L+B+\frac{1}{2} G \times \frac{1}{2} \sqrt{SA}}{2}$$

Cruisers are measured thus:

$$R = \frac{L+B+\frac{1}{2} G+\frac{1}{2} S A+d F}{2}$$

In the above R signified the rating value; L, the length of

the yacht; B, the greatest beam; G, the skin girth; F, the freeboard; S A, the sail area; d, the difference between the skin girth and the chain girth. All dimensions are in meters.

7. Measuring the Length, L.—The length, L, is taken from the yacht in full racing trim, without crew on board. For the purpose of determining the dimension L, the measurer has to take the length over all, L¹, parallel with the water's surface, and to deduct the overhangs. The length over all is taken by a couple of rods or a steel tape. The length of the overhang aft is taken from a plumbline dropped over the center of the counter to the edge of the sternpost.

8. Determination of Length in Special Cases.—Should the length of the yacht over all, L¹, be less than the length, L, the greatest length wherever found must be taken as L. Pieces of any form cut out of the stem, sternpost or fair line of ridge or counter with the intention of shortening the length shall not be allowed for in measurement of length if within 15cm. above the water level.

9. Taxing Extravagant Overhangs.—Should the length over all, L¹, exceed the length on the waterline by more than 50 per cent. (that is L¹ more than 1.5 l.w.l.), such greater length is added to the L.W.L. and taxed accordingly.

10. Determining the Greatest Beam, B.—The breadth shall be taken from outside to outside of planking in the broadest part of the yacht, and no allowance shall be made for wales, doubling planks or mouldings of any kind.

11. Determining the Chain Girth, Gk.—The greatest girth wherever found is taken from the top of the deck planking around the keel to the corresponding point at the top of the deck planking. The point of measurement is fixed by an official mark (G). Should the chain girth at different parts of the yacht be equal, the point nearest the greatest breadth is taken for subsequent measurement.

12. Determining the Skin Girth, Gs.—The skin girth is taken ashore by means of a steel tape. In the case of foreign yachts where their home certificate does not show their skin girth, these dimensions, in exceptional cases, may be taken from the designer's plans. The skin girth is also taken from the top of the deck planking, at the same spot where, according to clause 11, the chain girth is found.

13. Determining the Factor G.—Deduct from the skin girth twice the freeboard F. The difference is the factor G of the formula.

14. Calculating G in Light Centerboard Yachts.—Chain and skin girths of a centerboard yacht of 0.50 tons displacement and below are taken with the centerboard down to its fullest extent, treating it as a fixed fin.

15. Calculating G in Other Centerboard Yachts.—Chain and skin G of centerboard yachts, of more than 0.50 tons displacement, are also taken with the centerboard down to its fullest extent. In their case, however, only three-quarters of the plate is taxed, taking the lowest point for taxation at 0.75 from the bottom of the hull to the lowest actual point of the center plate. The bottom of the hull is taken at the cross-section where the girth mark (G) has been placed.

16. Ballasted Plates.—These are calculated in the same way as fixed fins, and must not be taken up during a race. Before receiving a prize, the owner or his representative must make a declaration that this rule has been observed. The measurers are bound to notify the technical commissioners if, in their opinion, a centerboard exceeds the usual dimensions. The technical commissioners will then have to declare how the plate is to be measured.

17. Determining Freeboard, F.—Freeboard, F, the vertical distance between the waterline and the top of the planking, is taken at that part of the yacht where the greatest breadth is found.

18. Determining d.—Deduct the chain girth from the skin girth and the difference is d. Clauses 18-22 deal with the measurement of sail area, the same as the Y. R. A. rule.

23. Limiting Crews.—The number of hands allowed during a race are limited as follows: Class VI., three hands; Class V., four; Class IV.b, five; Class IV.a, six; Class III.b, seven; Class III.a, eight; Class II.b, ten; Class II.a, twelve; Class I.b, eighteen; Class I.a, no limit. In all open matches a member of a recognized yacht club must be on board, who is included in the above figures, as is also any pilot.

The America Cup.

THE daily papers, which are taking a great interest in the new Cup defender, seem to be having a great deal of difficulty in determining of what material they will build the new boat. One day last week they had finally decided that she was to be plated with nickel-steel, the next it was positively announced that she would be of composite construction, with hackmatack frames and mahogany planking; a day later, and this method was abandoned in favor of phosphor-bronze plating. We have not yet heard that Mr. Herreshoff has suspended work until a decision is reached by this volunteer advisory board. From similar exclusive reports the challenger will be indeed a wonderfully manned craft. She will have in simultaneous command Capt. Hogarth, Capt. Wringe, Capt. Ben Parker and most of the other prominent British skippers, Scotch and English, and Mr. Watson will sail in her to help Mr. Fife.

The two points that are positively known about the defending boat are that the keel mold is completed and the patterns for the bronze keel have been completed and shipped to the Ansonia works at Bridgeport, makers of Tobin bronze and similar alloys, for casting. The Boston Globe of Jan. 4 gives the following details, and while it is impossible to verify them, they are all plausible and possible:

Bristol, R. I., Jan. 4.—The new Cup defender, soon to be built at the Herreshoff Works, will not be an out-and-out fin keel, but will be an improved Defender, having the same general model and plan of construction.

The "backbone" of Defender was the keel plate of cast bronze, to which the lead keel was fastened, and from which the frames went upward.

That the same form of construction will be used in the new boat was proved to-day by the shipment from the

Herreshoff Works to a Bridgeport, Conn., company of patterns for a keel plate similar in shape and design to that of Defender. The Bridgeport company handles only bronze work, so that the metal of which the keel plate will be cast may be considered settled.

Defender's keel plate was a bronze casting in three pieces, suitably flanged for bolting together into practically one solid piece. The same principle is followed in the keel plate for the new boat, and the pieces have similar flanges. The patterns show also the transverse ribs on top of the plate to give it strength, and also to afford a flange to which to rivet the floors and frames.

The plate in the new, as in the old Defender, will be an inch thick. The transverse webs are 3in. in height, and there are flanges on the edges of the plate of the same dimensions, giving the plate a practical thickness of 4in. for all purposes of strength and resistance to strains.

The transverse webs are about 20in. apart, showing that the frames of the new boat are to be spaced at that distance.

In shape, as well as in construction, the keel plate for the new boat is like that of Defender. Its greatest width is 20in., and it tapers to a point at the forward end and narrows in aft until it is less than half a foot across. This is where the sternpost, patterns for which were also shipped to-day, will be bolted to it.

Defender's keel plate was designed for casting as giving greater strength than any form of plate and rib construction, and bronze was chosen as the metal as being the best in which to obtain a strong and solid casting. The same reasons hold good in the new boat.

The lead keel for the new boat will be a little over 28ft. long, or about 7ft. shorter than that on Defender. It will also differ materially in shape, being in fact more like that of Valkyrie III. in lateral plane, while at the same time being "bulbed" to a greater extent and having its greatest weight further forward.

Defender's lead keel was "rockered" or rounded in the fore and aft sweep of its bottom, having a flat portion of only about 3ft. at its middle. The new defender's keel is flat on the bottom for nearly 18ft. of its length, and this flat portion will be parallel with the waterline, as in the 46-footer Wasp.

The top of the keel has a slope from the forward to the after end. The keel is about 7ft. high forward and 5ft. aft. The forward end comes to a sharp edge. The after end is flattened as if the rudder were to come down upon it, as in Defender. The after end shows a straight line from bottom to top to match the sternpost. The keel is nearly 5ft. longer on top aft than on the bottom, showing a sternpost with a great rake to it.

The forward end of the keel shows a rounded forefoot and then a reverse curve, which will blend into that of the stem. The difference between top and bottom is about 4ft., the extra foot or so to make the over all length of the keel being taken up by the rounding up of the forefoot. The whole keel is very similar to that of the Wasp, but is not so straight up and down on the forward edge.

The greatest thickness through the keel is about 4in., as against 37in. in Defender, and this is just abaft the forward end of the flat portion of the bottom. This also is a more pronounced "bulb" than on Defender, and concentrates the weight to a greater extent. At the same time the extreme thickness of the bulb is lower down than on Defender, the widest portion of the keel being only a few inches from the bottom and showing almost a square corner where sides and bottom come together.

The keel as a whole is finely shaped and of such model as to be easily driven through the water. The mold for casting it is practically completed, and the keel itself will soon be run. It is expected to contain about 60 tons of lead, as against at least 75 tons in that of Defender.

In model the new boat, as has been said, will be an improved Defender, but will approach more nearly the fin-keel type. She will have about the same or possibly a little less beam, and will have a flatter floor and a more rounded side. This at once gives a boat of less displacement than Defender, and at the same time with more power. As compared with Defender, the new boat should show an improvement in reaching and also in work down the wind with spinnaker set. The latter point of sailing was certainly not Defender's strong one.

An apt comparison of the old and new defenders in model and expected improvement in speed would be to take the 46-footers Gloriana and Wasp. The latter beat the former by very much the same differences in design as the new defender is showing over the old, and apparently every one interested has the same confidence in the result.

The question of a skipper for the new boat has been settled. Capt. "Hank" Haff, veteran of many cup contests, will hold the new boat's wheel in the races. Capt. Charlie Barr will sail Defender so long as she is needed for a "trial horse" for the new boat, and he will then go on the new boat as assistant to Capt. Haff, and undoubtedly will have charge of the setting and trimming of the light sails.

Capt. Barr has been under pay and engagement to Com. Postley, of the Colonia, but the latter kindly has relinquished his claim on him in favor of Com. Morgan for the season's racing. Capt. Barr will take some of the Colonia's crew with him.

The work of repairing Defender is nearly completed, and she should be launched and the new boat started in her place before the end of the month. W. K. Vanderbilt, her principal owner, is paying the cost of repairing her as his contribution to the defense of the Cup.

Com. Morgan is bearing the expense of the new boat alone, and Mr. Iselin will manage her on his behalf. A man of wider experience in Cup racing than C. Oliver Iselin it would be hard to find, and at the same time he has those qualities of "push" and determination which compel success.

W. E. ROBINSON.

The Forest and Stream Publishing Co. are the largest publishers and importers in America of Books on Outdoor Sports. Their illustrated descriptive catalogue will be sent free on request.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Yacht Measurement.

Editor Forest and Stream:

The new rule of the Massachusetts Y. R. A. is an interesting attempt to encourage the building of good cruising yachts. It has many excellent features as well as some that seem fundamentally wrong to the writer. Without discussing the rule generally now, the editorial remark in the FOREST AND STREAM, Dec. 31, that "we fail to see as yet the advantage of the new scheme over any good formula," deserves attention.

The Massachusetts rule, among other things, fixes a minimum limit to freeboard, headroom, dimensions of cabin floor, and ballast, and a maximum limit to sail area. These limits are so fixed in terms of length and beam that they are readily ascertainable by anybody, and are so arranged that none but yachts deemed good cruisers can be built under the rule.

The factors of the Hyslop formula, which is approved by the FOREST AND STREAM, are all variable, without limits of any kind, except such as are fixed by the exigencies of speed; and they can be ascertained only by years of building and racing. Any sort of a freak can be built under this rule, and such boats will be built if they have the highest speed. No man can tell what the ultimate product of this rule would be with respect to head room, floor room, freeboard, ballast and sail—all indispensable elements of comfort and safety. Five to ten years of sharp competition in racing would probably develop the general shape of the fastest type under this rule. It is doubtful if any advocate of the Hyslop rule would be willing to say that he can now tell what proportions of freeboard, headroom, cabin floor, ballast and sail, relatively to L. and B. this ultimate Hyslop boat would be.

With a view to producing good cruisers, it would seem to be of some advantage to know beforehand the precise effect a proposed rule would have on the fundamental factors of safety and accommodation.

SEXTANT.

YACHTING NEWS NOTES.

The Yachting World issues this year its usual extra "Christmas and Mediterranean Number," in addition to the regular weekly edition. The special number contains a varied collection of interesting reading, and many excellent illustrations in half-tones and special plates, a portrait of Ailsa under yawl rig being particularly striking. Mr. Linton Hope contributes an article on "A Day in a Skimming Dish"; Miss Edith Hughes writes of "Racing in the Solent Classes"; there is a special article in French on "L'Hiver a Cannes," and a portrait and biographical notice of Mr. Alfred Mylne, the young Glasgow designer. We reprint in this number one of the articles on the new German measurement.

Messrs. Tams & Lemoine, of New York, with whom Mr. C. H. Crane is associated as designer, have contracted with Messrs. D. Willis James and Arthur Curtis James, former owners of Coronet, for an auxiliary brigantine yacht. The vessel will be built by the J. N. Robins Co., at the Erie Basin dry docks, South Brooklyn, and will be of steel, 160ft. over all, 130ft. l.w.l., 26ft. gin. beam and 14ft. draft, with engines 9.14 and 18in. by 23in., and two Almy boilers.

Marcella, steam yacht, formerly Rajah, has been sold by J. B. Dickson to L. J. Busby.

The handsome mansion of Mr. George Bullock, on Center Island, Oyster Bay, close to the Seawanhaka C. Y. C. house, was burned on Dec. 30, being a total loss. Mr. Bullock and family were at their winter home, Cincinnati, at the time.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

Jan. 11.—Lyndhurst, N. J.—Twenty-five live-bird handicap, \$10, birds extra; commences at 12 M. T. W. Morley, Sec'y.
Jan. 17-20.—Hamilton, Ont.—Annual tournament and grand Canadian handicap of the Hamilton Gun Club; \$1,000 guaranteed. H. Graham, Sec'y.
Jan. 18.—Reading, Pa.—The Reading handicap; open to all, \$10 entrance, \$150 guaranteed. Arthur A. Fink, Manager.
Jan. 18.—Stony Creek, Pa.—Stony Creek handicap, 25 live birds. A. A. Fink, Manager, 426 Franklin St., Reading, Pa.
Jan. 21.—Holmesburg Junction.—Fulford-Heikes contest for E C cup at 1:30 P. M., on grounds of the Keystone Shooting League, Holmesburg Junction, on Pennsylvania R. R.
Feb. 4.—Lyndhurst, N. J.—Tournament of the Lyndhurst Shooting Association. Main event, Money vs. Morley, for the E. C. cup and championship of New Jersey. T. W. Morley, Sec'y.
Feb. 22.—New Haven, Conn.—New Haven Gun Club's tournament; \$20 added money. J. B. Savage, Sec'y.
Feb. 22.—Worcester, Mass.—Tournament of the Worcester Sportsmen's Club; targets. A. W. Walls, Sec'y.
April 6-8.—Utica, N. Y.—Fulford's handicap at live birds. E. D. Fulford, Manager.
April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament.
April 18-20.—Lincoln, Neb.—The Lincoln Gun Club's second annual interstate tournament; targets and live birds; \$500 added. Geo. L. Carter, Sec'y.
April 18-21.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.
April 25-28.—Baltimore, Md.—Tournament of Baltimore Shooting Association; targets and live birds; money added. Geo. L. Harrison, Sec'y.
May 16-19.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.
May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.
May 24-25.—Greenwood, S. C.—Annual live-bird tournament of the Greenwood Gun Club; 25-bird Southern Handicap. R. G. McCants, Sec'y.
June 7-9.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. J. C. Porterfield, Sec'y, O. T. S. L.
June 7.—Buffalo, N. Y.—New York State shoot, under auspices of the Buffalo Audubon Gun Club. Chas. H. Bamberg, Sec'y.
June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.
June 20-22.—Sistersville, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. John B. Garden, Sec'y.

Hill Top Gun Club.

PARIS, Ky., Jan. 6.—The third annual crow and target shoot of the Hill Top Gun Club began on Jan. 4, on the grounds of the club, near this city. The weather was very rough, and prevented successful score making. The attendance the first day was large. A very high wind blew from the west, a veritable hurricane of forty-five miles an hour, preventing any record-breaking scores; but the shoot was very interesting and enjoyable both to the shooters and spectators. Many of the crows, after being killed drifted out of bounds and were lost to the score.

The second day opened cold and promised a good day's sport, but the rough weather and the prevalence of the grip prevented many from attending. Nevertheless, the event of the day, the "crow championship of the world," was won in one of the best shooting events ever held on the grounds of the club. George Williams Clay and Thomas Henry Clay, Jr., tied with 25 straight, and Harvey Chenault, of Richmond, showed a good second with one miss. The shoot-off between George Williams Clay and Thomas Henry Clay, Jr., was at 5 birds, and again they tied, each having 4 to his credit. A second tie was shot off, with George Williams Clay 5 straight and Thomas Henry Clay, Jr., 4.

The trophy for this event was a handsome solid silver goblet, engraved with the words "The Crow Championship of the world," presented by the Hill Top Gun Club to —. The name of Mr. G. W. Clay will be engraved upon the cup at the instance of the officers of the club. The cup was presented to the champion by Mr. Alfred Clay, the president of the club, with appropriate remarks, and the response showed the appreciation in which the receiver held the trophy won after such a contest. This was the banner meet given by this club. Not only was the score very excellent, but the social features were of the most agreeable character.

Each day the visitors were treated to a genuine Kentucky burgoo, served with old-time hospitality. The shoot was voted as one of the most successful sporting events of the season.

First Day, Wednesday, Jan. 4.

Event No. 1 was at 5 crows, \$1.50 entrance, money divided 60 and 40 per cent.:

S Clay20000-1	H B Clay22120-4

Shoot-off for the cup: G W Clay.....222021222-9 T H Clay, Jr.....2202112202-8

G. W. Clay won the championship at crows: Sam Clay killed 4 straight and won. S. G. Clay missed his 4th, Spears his 3d, Chenault and Gay their 2d, Peed, Steel and Smith their 1st. Event 9 was at 5 crows, \$2. Score: Steel 4, S. G. Clay 3, Sam Clay missed 2 out of 3 and withdrew. The shoot was declared a success.

J. L. B.

Boston Gun Club.

WELLINGTON, Mass., Jan. 4.—Just a full squad negotiated the different events at Wellington, Wednesday afternoon, Jan. 4, the other half-dozen apparently being bluffed by morning downpour. They failed to take into account this variable climate of ours, which is capable of greater expansion than two extremes within six hours, consequently missed a pleasant January afternoon. The usual breeze arrived on time, thus the scores in the individual match were distinctly above the average. Straights were comparatively easy for Gordon, who made 3; Woodruff, Spencer and Miskay 1 each.

The double event proves always the trying time for those anxious to make a good impression in the match. A good score on the singles is quite liable to be robbed of splendor by a poor one on the pairs; nevertheless an excellent plan to follow is to make sure of the singles and trust to luck on the others. Then if making no errors on the first bird one is sure of three and a possible chance of one out of the three second birds dying of right, if not accurate aim. A trite remark often made at the beginning of this event is "Remember, you can't score a pair unless you get the first bird," so it behooves the anxious amateur to take a careful first aim before giving much consideration to the second. Sometimes we do it, sometimes we don't.

Following are to-day's scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Targets:	10	10	6	10	10	10	5	6	10	10	10	10	10	10	10
Gordon, 176	5	5	10	10	7	3	3	9	6	7	7	10
Miskay, 189	10	3	5	9	9	3	3	7	8	9	6	7
Woodruff, 178	8	3	9	8	9	4	5	10	7	9
Sheffield, 168	9	3	6	9	4	3	9	5	7	5	9	7	15
Williams, 159	6	3	9	7	6	3	3	5	7
Parker, 166	5	1	1	5	7	3	5
Peed, 188	10	5	3	8	6	7	6
Gifford, 163	4	2	7	7	9	8	9	9	17

Events 2, 7 and 10, unknown angles; 3 and 8, pairs; 4 and 12, reverse; balance known.

Third contest, prize series, 21 targets: 10 known, 5 unknown and 3 pairs:

Spencer, 18111111111-10	11111-5	10	10	10	3	18

The New Jersey Championship at Newark.

Jan. 5.—The All-day target shoot of the East Side Gun Club, of Newark, on Smith Brothers' grounds, was well attended, the main attraction being the contest between Messrs. T. W. Morfey and Louis H. Schortemeier for the E C cup, emblematic of the championship of New Jersey. Competition for this cup was open only to residents of the State of New Jersey, who are members of clubs who are members of the N. J. State Sportsmen's Association, but it was placed in open competition at Hackensack, N. J., on Dec. 7 last. Schortemeier defeated fifteen competitors by the excellent score of 47 out of 50. Morfey immediately challenged for it, placing \$10 forfeit and a written challenge in the hands of the secretary of the E. C. & Schultze Powder Co., thus taking the necessary steps to qualify. The targets were thrown after the Sergeant system, unknown angles. It was the fifth event shot, and was witnessed by a large audience. Schortemeier was not in his usual good form. His time was slow, and he made hard shooting for himself thereby. Schorty lost 9 out of his first 25, while Morfey lost but 6, and then had the race well in hand.

Among the noted shots present were Capt. A. W. Money, who has almost entirely recovered from his recent illness; Mr. Edward Banks, J. Fanning, J. J. Halliwell, Ed. Taylor, and others. The famous visitors shot for targets only.

The Forest and Stream Platform Plank.

"The sale of game should be forbidden at all seasons."
—FOREST AND STREAM, Feb. 3, 1894.

THE RATIONAL AND THE INSANE.

THERE is one reflection which goes far to ameliorate the disgust and indignation excited by such exploits as Mr. Frank S. Daggett reports from Southern California; and this is that the game score smashers are not representative types of the shooters of America as a body. If it were otherwise, and a preponderating majority so large as to give stamp and character to the whole class were made up of these braggart butchers, who are possessed by a frenzy of lust for bird blood, no decent and self-respecting individual jealous of his good name and the regard of his fellows could afford to confess himself a sportsman. The game killer for count is much in evidence, since what he does is sensational in its nature and something which will command newspaper notoriety; but for every one of these slaughterers whose exploits are heralded in the press there are a thousand gunners moderate and reasonable in their desires and practices. The difference between the two is the difference between the rational and the insane, for the best working theory to account for the inordinate game slaughterer is that he is acting in a fit of temporary mental aberration. How can a man be in his right mind and kill 100 quail a day for sport? Or if in his right mind, what kind of a mind must he have? How can a man claim to be rational who craves to read his name high above the rest in a newspaper story of bird butchery?

If there are gunners whose innate sense of decency, or whose regard for the rights and privileges of other people does not call a halt when a reasonable limit of sport has been reached, put a legal restriction on the amount of game a person may take in a season, a month, a week, or a day. "But how can we enforce such a law?" "How can you know what a man or a party of men may do in the field?" True, a law of this character could not always be enforced; it cannot be known how much game is taken by those afield, but this the restriction can do, and does do, and will do: It cuts off bragging about big scores of the game. It says to the insane notoriety-hunter, you shall not kill for record; and as for most of these count killers, when you have taken away their opportunity of boasting you have taken away with it the motive which impels their shooting.

No individual, nor any class, has license to pursue the game in a way or to an extent inconsistent with maintaining the normal stock. On this ground and on this ground only is established our Platform Plank, to stop the sale of game at all times; because experience has demonstrated that it is market-hunting which exhausts the supply and destroys the parent stock. Against the individual market-shooter we have no grievance; so long as the system is recognized and legalized, denunciation of the individual participant in it is neither reasonable nor just. More inimical than the individual market-shooter to the interests of the rational sportsman, and so of the community at large, is the man who kills for score and to brag. The market-hunter who nets 100 quail for market is engaged in an enterprise vastly more justifiable than that of the shooter who pots 100 birds in a day for no better purpose than to outscore his fellow whose count is ninety. The exploits of the score shooter, as we have suggested, may be accounted for on the theory that he is temporarily insane; it is certainly no evidence of his sanity that on coming in from his record shoot, like the horseleach's daughter unsatisfied, he vehemently curses the market-hunter, but for whose pot hunting, as he calls it, he might have made a bag for the day even more prodigious than that achieved. "There are three things that are never satisfied," says the sage Agur, "yea, four things say not, It is enough." If he were writing now he would add a fifth.

Your insane count shooter, who gets himself and his bag of game, and likely enough pictures of both, into the newspapers, is a pest to sportsmanship in three ways. He kills game that belongs to others, to several others, to many others. He creates the popular fallacy, which naturally comes from the reading of his exploits, that all sportsmen are insane, blood-craving demons. And lastly,

he is a most embarrassing factor in the fight for game protection, for people imagine that he represents the class of grown-up male humans in whose behalf we want the game protected.

UNITED STATES MAILS AND SMUGGLED GAME.

THAT is a bright suggestion made by Dr. Robert T. Morris, to train dogs to smell out the boxes of illicit game in railroad freight and express offices. It recalls the story of the London cockney who hired a gun and borrowed a dog and went out to bag his birds the same as other people. The first thing the intelligent canine did, when they got into the field, was to point the cockney himself, who had his pockets stuffed with dead birds secured at a market stall on the way out, thus providently assuring himself of a successful home coming.

Dr. Morris's game box smelling puppies would have a field of usefulness in those North Carolina railroad towns where a regular traffic in quail is conducted by mail and express agents on the north-bound trains. There is a well-arranged and but partially concealed system by which the daily consignments of netted quail are received at the station by the employees from the netters, with whom they are in league, and taken to Washington and other cities for sale at what must be profitable rates. For presumably unless there is money in the enterprise these express and mail agents would not have hazarded their positions by committing a misdemeanor, as they do every time they carry the illicit game. Now, is not this a preposterous state of affairs? Here in North Carolina is a law forbidding the export of quail, and the United States Supreme Court has declared that such laws are constitutional and enforceable; and yet agents of the National Government clandestinely carry North Carolina game right into Washington and dispose of it under the very nose of the Supreme Court.

What can be done about it? Two things. First, let Congress enact Senator Proctor's District of Columbia game bill into a law that shall close the Washington market in the close season, and so remove the long standing disgrace that now exists, of a dumping ground maintained at the Nation's capital for the receipt of game unlawfully and dishonestly shipped from the constituent States of the Union. Second, let the Post Office Department see to it that employees who handle the United States mail on the railroads of North Carolina shall not also handle game birds, which they smuggle out of the State in violation of the law. If the Department can find no other warrant for the course suggested, let it act on the principle that the individual who is engaged in systematically and continuously, for the benefit of his own pocket, violating the laws is not a fit person to be entrusted with the custody of United States mail matter. If the Department inspectors are unable in any other way to discover the quail, a capital experiment would be to outfit with a corps of intelligent setter puppies, trained in the way Dr. Morris suggests.

SECTION 249 AGAIN.

PRECISELY as was to have been expected, an effort is making this winter to restore to the New York game law the obnoxious Section 249, to permit the sale of game the year around; and as before, those who are advocating the provision are going about their business by very devious methods. There was "crooked work" in the first place, when the section was juggled into the game bill; for it has been averred on what may be accepted as good authority that the section was never approved by the two branches of the Legislature, but was interpolated into the bill without authority. Last winter, when the question of a repeal was before the game committee, the constituted champion to defend the section was Mr. Gilman, of a cold storage concern in this city, who had the assurance to tell the committee with a straight face that New York game dealers never handled any game birds received from quarters whence shipment was forbidden. It happened that the advocates of the repeal could meet this with documentary evidence. They produced from the records of Chief Fish and Game Protector Pond's office a series of express receipts tracing the illicit shipment of grouse from a certain point in the State to the city market, by a roundabout route to a point outside the State and then back again. This did for Mr. Gilman so ef-

fectually that nothing was left of his case, and the section was repealed. Now, as will be seen from communications printed in our columns, Mr. Gilman has again appeared in advocacy of Section 249, and again with a declaration which has not stood the test of investigation. He declared that Mr. Frank J. Amsden, of Rochester, and Mr. Robt. B. Lawrence, of this city, both of whom last year opposed Section 249, had been converted from their former position and are now in sympathy with the endeavor to restore the provision to operation. Mr. Amsden is an ex-President of the New York Game, Fish and Forest League, and Mr. Lawrence is Secretary of the New York (City) Society for the Protection of Game. Naturally, both are indignant at Mr. Gilman's misrepresentation of their true attitude, and they have sent us the disclaimers which we print to-day, and thus by documentary evidence demonstrate the character of Mr. Gilman's assertions as effectively as his statements before the committee last year were rebutted by the documentary evidence supplied by Protector Pond.

The incident is not regrettable if it shall have served to enlighten the Legislature as to the actual value they may attribute to what Mr. Gilman may have to offer respecting the proposed re-enactment of Section 249. Meanwhile it behooves the citizens of this State to watch their interests and to maintain the law as it stands now.

SNAP SHOTS.

Although the war with Spain is over, yet many reminders of it—some pleasant, but most of them sad—come to us from time to time. Among the pleasant ones are the frequent notices which appear in the newspapers recounting brave deeds and good service performed by readers of FOREST AND STREAM and writers for it, while the sad ones tell of death and wounds received by others whose faces or names are familiar to us and to our readers. One of these newspaper mentions, recently read, telling of the return from Manila of the well-known Astor Battery, says that all the members of the Battery are on their way home, except six men who have died and Sergeant Harry L. Burdick, who is in hospital in Manila with typhoid fever. Sergeant Burdick, it will be remembered, was the writer of an interesting sketch of white goat hunting which appeared in the FOREST AND STREAM Jubilee number last June, illustrated by a photograph from life of a white goat on the face of a cliff—a most striking piece of work.

The Maine Commissioners' report on the game interests demands careful reading by all who visit those hunting grounds, and by all who are interested in the progress of the day in methods and expedients of game preservation. Whatever may be individual opinion respecting the licensed guide system, the length of game seasons, the taxation of big game hunters and other schemes, actual or proposed, it must be conceded that Maine is to-day doing a great work for the game supply of the country at large by her earnest and progressive enterprise in this direction. On most of these topics discussed in the report we give the views of Mr. Carleton and his associates practically in full.

The discussion of the Lacey bird bill in Congress took an unexpected turn the other day, when Mr. Cannon, of Illinois, spoke in opposition to the measure from the standpoint of economy, and of a recognition of the proper jurisdiction of the National Government and that of the individual States. Mr. Cannon was unquestionably right, and all he required in order to have made out a good argument was fuller information on the subject. Had he been properly equipped by previous preparation to present his side of the question, he might have adduced arguments for which it would have been hard to find answers.

The late Robert R. McBurney, who was for thirty-six years General Secretary of the Young Men's Christian Association in this city, was a collector of Walton's Angler, of which he possessed some very rare early editions, and it is interesting to note that one of his eulogists, at a memorial service held last Sunday, went to Walton for a characterization of his subject in these words: "Izaak Walton said that a companion that was cheerful was pure gold. I am sure he would have enjoyed the companionship of Robert McBurney."

The Sportsman Tourist.

In Old Virginia.

Part I.

THERE are a few old-fashioned darkies left in the South, both big and little.

The best specimens are to be found "way down south in Georgy" and in "Old Virginia."

They live on the plantations lying back in the interior a distance from towns and railroads. These facts I learned some few years ago, when the handsome matron, who now sits across the table from me, talking "Sanscrit" to a future president, was an occasional resident on a plantation of large value in southeastern Virginia, six miles from town and three miles from the railroad, which had been in the family for generations.

My first visit to her country home was fraught with many pleasures, aside from the delight of basking in the sunshine of her smiles. The plantations comprised a thousand acres of cultivated and forest land, surrounded by much that had not been cultivated since the war, and made an ideal place for enjoying field sports; as game was most abundant.

The negroes were the real old-timers, many of them having lived all their lives on that or neighboring plantations, as had their ancestors before them, proudly bearing the names of many F. F. Vs. My advent had necessitated preparations that had put the darkies on notice, and they had questioned a little, surmised much, and finally concluded thus: "Mis' Lady's young man is comin' from the city to visit we all." No one visits exclusively the family in the "big house" on a plantation where the old-time darkies are found; and he comes to grief who attempts it.

"Weighed and found wanting" is the verdict returned by the loyal attachés against the visitor who, like the frog, "a-woooing goes," laboring under the delusion that his suit is won or lost in the parlor, and needs only to be pressed there. Every darky on the place that could be spared from his or her work was peeping around one side or the other of the house when the carriage that had been sent to meet me at the station drove up to the front gate.

They made no effort at concealment, but simply went through what they consider the proper form on such occasions, standing far enough out to see well, while pretending to make an effort to hide behind the angles of the porch, corners of the bay windows or convenient shrubbery.

Southern born and knowing my audience, I stiffened up like a drum major and strode up the walk with as near the air of a "conquering hero" as I could command; feeling sorry that my silk hat was not on my head, where it would have made me almost an assured success, instead of in my hat box.

Uncle Ben, the driver of the carriage, coming in for almost as much attention as myself, as he struggled along in the rear with a heavy load, composed of my baggage, gun and shell boxes; his profound dignity an exaggeration of my own. To have shown by word or sign any knowledge of the fact that the crowd of servants were watching and audibly criticising me would have been—in their opinion—a serious breach of etiquette, and would have resulted in grave doubts of my being "real quality." So with bold, but discreet, looks to the right and left, I mounted the broad front steps, struck the old-fashioned knocker, and turned to dismiss Uncle Ben, who had followed and placed my baggage on the porch. The old-fashioned coachman does not enter the house where there are house servants; but stops at the entrance, if indeed he leaves his team at all, which he only does with those to whom he wishes to pay marked attention.

As he backed down the steps, bowing his thanks, and showing by unmistakable signs that my genuineness was firmly established in his mind, the door opened and my fair hostess welcomed me to "The Elms."

Within twenty-four hours of my arrival I was acquainted with all of the "boys" and "girls" and "uncles" and "aunties," as they are there classified, on the place. All of the male darkies being boys until they reach the stage of uncle; and all of the females girls until age and dignity puts them in the class of aunties.

All of the field hands learned my name at once, and never failed to show their ivories to the remotest molar as they bowed and pulled at their old hats when we met. The oracle of the big house on the plantation is the cook. She moulds and forms the opinions of the other servants, and influences in a greater or lesser degree that of the family she serves.

She is nearly always an "auntie," and is aggressive, bigoted, uncompromising, kind, faithful and efficient. A dear old paradox, alternately beloved and feared by the entire household. I knew her well, and respected her accordingly, and always sought an opportunity to propitiate her as soon as possible after my arrival at the various hospitable Southern homes it had been my happy lot to visit.

It was therefore with real trepidation that I heard the evening of my arrival the laughing remark of one of the older ladies of the household, addressed to my fair young friend, for the purpose of teasing her, which was to the effect that: "Aunt Ellen (the cook) had told Mil-lie (the maid) that that town man was not near big enough nor half good looking enough for her Mis' Lady."

I made up my mind that Aunt Ellen and I must become better acquainted at the very earliest opportunity. Waking early next morning, and having learned the night before that the woods near the house was fairly well stocked with gray squirrels, I slipped into my corduroys, and taking a handful of shells loaded with chilled sixes, and my gun, quietly left the house before any one was astir for a try at them, still-hunting.

It was just gray dawn when I got well down in the heavy timber, and the woods was oppressively silent.

There is something awe inspiring about the breaking of day in a forest that causes one to carefully avoid, as far as possible, any disturbance of the solitude. In the fields or open the desire is to whistle, sing, or shout aloud at daybreak, but not so in the woods.

Stealing along, listening for a sign, it soon grew light enough for me to see to draw a bead on the first unwary

imitator of the "early bird" discovered, and I was glad to hear that regular old herald of the approach of day, the ivory-billed woodpecker, making the woods ring with his rattling strokes on a dead limb.

He is the first fellow out in the morning, and his first act is to kick up a fearful row, that everybody may be apprised of the fact. My strained senses of sight and hearing were both soon rewarded by the sound of a nut or bit of bark falling, and a limb swinging in a large white oak near. The leaves were heavy on the ground and rather dry, but fortunately a path that was tolerably clear led within good shooting distance of the tree. Moving up carefully, near enough to command the tree, I soon had a glimpse of fur, while at the same time a limb shook in another part of the tree, showing a pair treed. I soon had them located so that I could have a fair shot at either one, but the survivor would be so situated that he could take cover at once without giving me a chance for a shot, so I concluded to wait a few moments and see if they did not change and locate as I wanted them.

My patience was soon rewarded by getting one well out toward the end of a long limb, and the other down near where it joined the trunk. I shot for one first and took the second in the air as he jumped for the body of the tree, killing them both dead.

Slipping in fresh shells, I heard a sound behind me, and turned just in time to see a squirrel making out on the limb of another oak toward a poplar, with the thick foliage that looked as if it might be a den tree.

It was a long shot, but I chanced it, and succeeded in knocking him out of the tree with my first barrel, but he lit running.

Expecting this from the way he fell, I had sprinted a little myself in his direction, while he was sailing for "terra firma," and getting close enough for more effective work, knocked the run entirely out of him with the second barrel. As I gathered up my three squirrels—all young and in fine condition—it occurred to me that I was in a good squirrel country, that it was a good day for squirrels, and that it was not a debatable question as to whether or not life was worth living.

The sun was not yet up, but I could hear a bell ringing at the house that sounded like the old bell on the school-house, where I shirked through my first few years of weary wayfaring on the road to knowledge when a boy, and that I knew to be the manager's signal to the field hands who lived at what was still known as "the quarters."

Noticing a rail fence near by, I concluded to work down that a short distance, and then return to the house. Before I had gone 100 yds. along the fence a squirrel, either going to or from breakfast, and in a desperate hurry, almost ran over me. I turned him back and killed him on the run. His speed was so great as he turned the sharp angles of the fence, it was almost equal to shooting jack-snipe. My shooting coat feeling heavy with its load, I turned toward the house, which I judged to be less than one-half mile distant. I hunted along carefully, but without expecting any further success, and was just debating in my mind whether I would not shoulder my gun and strike straight for the house, when, from a thicket a short distance ahead, came a sharp put! that froze me in my tracks. It was a turkey sure, but whether wild or tame I did not know. It seemed close to the house for that wary bird, the wild-turkey; and yet it was far from the house for that discreet bird, the tame turkey, that is considering the woods. The tame turkey will range the fields for miles, but fights shy of the thick woods.

Five, ten, fifteen minutes I stood in my tracks, every muscle tense, and my eyes sweeping the general direction from which the sound had come, watching for the slightest movement.

A wild turkey, when really startled, is only a faint, dark streak when it concludes to change its location in the woods; and the man that stops him on the ground is indeed true of eye and quick of hand.

I finally concluded that as nothing further was heard from the one that had startled me, it was probably just concluding a century run in some adjoining counties, so moved on. My hunt was not over yet, however, for a few moments thereafter a hickory tree loomed up just ahead, and it seemed to be full of squirrels. Ten, at least, I thought; and would think so yet had I not approached, killed and bagged them every one, and found the grand total two. They were thrashing down nuts like a pair of town boys with bushel sacks to fill, and let me walk right up to the tree before they desisted.

The first one gave me no trouble, but the second got into the thick leaves and cost me three cartridges, sent as range finders, before he developed. I was now six squirrels to the good, and Old Sol was not chin high over the eastern horizon.

Not over an hour and a half had elapsed since I had awakened, with the sense of freedom that always comes to the enthusiastic sportsman whose vacations are few and far between. Reaching the edge of the woods, I found myself in the rear of the house, and concluded to go in by way of the back gate in hopes of seeing Aunt Ellen as I passed the kitchen. Two boys were at the woodpile working out enough wood to get breakfast.

One was chopping while the other sat on a log waiting until there was an armful to carry in. The average boy will never prepare more wood than enough for immediate necessities, unless closely looked after. They will chance having to dig wood from under 3 ft. of snow in the morning rather than chop a double quantity the night before. To my "Good morning, boys," they both replied respectfully. The chopper then said: "Has you been after de squ'ls, suh?"

I replied in the affirmative. "Right smaht of dem in de woods, suh; did you see many?"

I replied that I had seen six. My questioner paused a moment as I moved slowly off, as though fearing to embarrass me, but his curiosity overcame his scruples, so he said: "How many of 'em did you git, suh?"

As I intentionally hesitated a moment before replying, for the purpose of dramatic effect, the kindhearted fellow looked as though he was sorry that he had asked the question of me; fearing that I had failed to bag any game. When I finally answered: "All six," his first look was one of profound surprise, which shortly changed to one of incredulity.

But his politeness stood the strain, and he replied: "You got 'em all six? You didn't let nary one git away?"

Well, suh! Sholy you mus' have a s'archin' gun"; "and," added his companion, "know how to shoot her too, suh." I knew that their politeness was struggling with their doubts to accept my statement, and therefore was not surprised when they both grabbed up a few sticks of wood and followed me to the kitchen, where they hung around until they had ocular demonstration of the truth of my story.

Aunt Ellen was moving around in the kitchen just beginning her preparations for the family breakfast. As she heard my approach, she came to the door. "Good morning, Aunt Ellen," I said.

"Good mawnin', suh," she replied, and added quickly: "How you know my name?"

"How do I know your name, Aunt Ellen? Why, I have known your name and much about you for a long time. Miss Lady often tells me about you in the letters she writes me; and she told me how glad she would be to get back to you when she started down here on this visit. I feel like I had known you a long time."

During this rather long speech Aunt Ellen was looking me over carefully from head to foot in a furtive manner. When I concluded, she was silent for a moment and then said:

"Did Mis' Lady reely write in a lettah 'bout me, suh?"

"She did, Aunt Ellen, several times," I replied.

"Where you bin, suh?" she suddenly asked.

I told her.

"Did you git any squ'ls, suh? Miss Lady mighty fon' of squ'ls."

For reply I reached in a pocket and pulled out a squirrel and handed it to her.

"Now, dat's a nice fat squ'l," she said.

I handed her another one.

"Two," she cried, "dat sho is fine."

I drew out another.

"Three," she almost shouted, "why, dat's enough for a Brunswick' stu."

When the fourth appeared she seemed too surprised for further speech, and simply ejaculated, "De good land sakes!"

She looked on in silence as the fifth and sixth squirrel appeared, and then seeing that my pockets were empty, she broke forth into speech again.

"Why, where has you dun bin to, suh, to git all dem nice fat squ'ls, an' hit not sun up hardly yit. Why, you sholy do beat all de shootens dat ever I seed. Day ain' nobody ever come on dis plantation smaht enough to git six squ'ls before sun up in de mawnin'. You sho mus' be 'tied, suh. Set down an res' an' lem me git you a cup of coffee an' a snack to stay yo stummik 'til breakfus' is reddey."

I sat down on the steps while she bustled off to prepare the "snack."

When she returned with it, I soon had her going on the subject of the "Fohmost famblies of Vuhginy," in whose inmost circles we had mutual acquaintances; a subject that your real old-fashioned darky, male or female, never tires of discussing. Thanking her most cordially for her hospitality, I finally took leave of her to prepare for breakfast, but not until she had again assured me that my morning feat was unparalleled, and that I must come by for a snack whenever I was out early in the morning. My morning so far had been a success from every point of view.

While smoking an after-breakfast cigar on the veranda I again heard a remark of Aunt Ellen's quoted to my fair young friend by the same elderly lady who had caused my uneasiness the night before. It was plainly audible, and to the following effect: "Aunt Ellen says that if you do want to get married you can't ever have any better chance than that nice city man who has come visiting you, as he is a good provider and real quality too."

Just then I heard Aunt Ellen answer some one in the most peremptory manner, from the neighborhood of her domain, "You can't have Cicero now, nor foh a long time yit; he skinnin' my squ'ls. LEWIS HOPKINS."

Just About a Boy.—XVI.

"So that's the Dismal River, eh?" said the boy, as we drove up to the edge of the sand dunes, where the road pitched its yellow length down toward the stream.

"Less stop here a minute an' look at things," he continued. "Seems 's if all these rivers out here just kinder got lost like 'n' go galavantin' 'round through th' country 'thout no speshul reason 'tall. They ain't as nice as a river with trees all 'long th' bank, are they? Is ever 'river 'n' this country here this same way, juss nothin' but a sort o' ditch like, a runnin' crost th' prairie when they ain't more sand than they is water?"

"Well, they are a good deal alike," I answered, "most of them being a ditch as you say, down in a wide level valley like this one, and all of them are full of sand, more or less—quicksand too; by the way, and it is apt to make travel anything but a dream of pleasure, if you happen to get down in it with the outfit."

"Do you see that little bunch of cabins away up the valley there, on the right bank of the Loup? No, here, away up above the mouth of the Dismal, up this other valley—that's the middle Loup, and this river right here in front is the Dismal."

The boy looked slowly up the second valley with the glass, and then said: "Uh, huh, I see 'em—sort of a farm, I guess."

"Well, that is Farmer's ranch, seven miles from here, and the last ranch but one between us and Pine Ridge. The next is Stem's ranch, forty miles further up stream and only a little way from where the Middle Loup rises in Dock Lake, which is just this side of the Niobrara divide. I think we had better cross both rivers and camp at Farmer's to-night, then go on up to Stem's to-morrow."

"What's the matter with goin' down below th' mouth o' th' Dismal, 'n' crossin' th' Loup down there—won't haff to cross but one river then, 'n' it 'd be easier, seems t' me."

"That's where you lack wisdom, my son, and show that you are a sure tenderfoot in this country. You must remember that the banks of these rivers are straight up and down, and from 4 to 40 or 50 ft. high. You can't drive a team up and down such places very easily, can you? Then you must remember that this trail we are following was picked out by the cow-punchers up here as the best route to haul supplies in to camp over, so don't try to hunt a new road

—these fellows know the country and you and I don't, see?"

"Yep, 'less g'won 'n' git to where we're goin' then, cos th' sun ain't any too high to drive seven miles 'n' git into camp decent."

We careened and jolted down the strip of yellow sand, sometimes with a deep gully perilously near one side of the road, sometimes with good traveling under us, but always with the brake grinding against the wheels and the bronchos bracing back against the stout harness until we rolled out on the level flat and on down to the sandy stream, across it and up the valley of the other until we were opposite Farmer's ranch.

Here it was necessary to ford the Middle Loup, one of the worst quicksand rivers in the West.

"I expect we'll get down in the sand here with the outfit, sure," I remarked; "never crossed this river when I didn't, so we would better get into shape to work quickly if we do."

The boy looked at me with a quick side glance that he had a habit of using, and said: "Humph. That's a nice layout, I reckon. What yeh goin' to do to buck quicksand anyhow?"

"Well, about the first thing is to be ready to jump overboard right suddenly if the horses go down, and get them loose from the wagon and loose from each other so they can flounder across. The water isn't very deep, and if a broncho is free to flounder around all he wants to, you won't see him mire down so he can't get out. We'd better get off our shoes and surplus clothing and get the picket ropes and tow line ready for business. Better fasten a picket rope to each horse's neck and bring the coil back into the wagon, because these horses of ours would be pretty hard to get hold of if they got loose in this country."

Everything was soon in readiness for the crossing, and we drove out into the current of the stream. All went well until we were in mid-stream, then the horses struck the quicksand, and after a couple of ineffectual floundering leaps they were both fast down in the sand, until the water lapped over their backs as they lay mired there in the current.

"Now, out you go, partner," I said. "Get your horse loose from the traces and loose from the other horse. I'll attend to this side. They won't move for a minute or two, but when they begin to throw their heads up, look out, for they'll jump in a moment more. Get hold of your horse's rope and let him go to the bank after his own fashion, but stay with him. You must keep moving as you work or you'll go down too."

We were both in the water and working swiftly while I talked, loosening the traces and the snaps that held the neck yoke and lines to the harness.

"Look out now! Your horse is going to get up—get away from him!" I shouted, as I saw signs of movement on the boy's side.

The horse floundered to his feet, went down, plunged up and ahead again, and kept going until he reached the bank, where he stood dripping and quiet, with the boy safe by his side.

My horse rested a little longer, and then he too got up, only to get down worse than ever, but he was a range horse, and had been through this same experience before, so he kept quiet a few minutes and then began to roll, going entirely under water and over on his other side, where he jumped to his feet, plunged forward, and was down again.

Trying to drive a horse under such circumstances will only result in disaster, but if left to take their own time they will come out all right, so I kept moving about and let the horse work out his own salvation, and in a few minutes he, too, stood panting and wet beside the other on the bank, none the worse for wear.

"Now you take care of the team and I'll get the neck yoke and double trees, so we can tow the wagon out," I said to the boy, as I waded back after these two much needed articles that were still in mid-stream on the slowly sinking wagon.

"Now hitch them up and fasten the two picket lines to the double tree," I said, as I went back again after a heavy line, which we had brought along for just such scrapes, and I soon had it fast to the doubled picket lines and to the end of the wagon tongue.

"Now when you are ready drive straight back away from the river so you will pull the wagon across, and I'll stay here to keep the tongue up and steer the ship," I called to the boy as I got back to the wagon again.

"All right; ready?" he asked.

"Yes, go ahead."

The wiry little team put a strain on the rope, then got down close to the ground and pulled like majors. The wagon heaved upward out of the sand and then rolled and swayed across the current like a ship at sea, as the wheels sunk into the soft spots in the bottom, and were pulled on out again, and at last the outfit rolled up the bank and came to a stop on the solid ground.

"Say, gee," said the boy, "I'd never 'a' thought o' that way o' gettin' out o' th' sand!"

"That is a trick I saw worked a long time ago, my boy, by an outfit right down on the South Loup. It isn't very elegant, but you notice it works, as all the other little things work out here, where men have to take care of themselves."

"They's always a way to do everything most if yeh juss know how, but th' trick of it is learnin', ain't it?" said the boy.

EL COMANCHO.

"Blank Days."

Who does not know them? They are as common as mosquitoes in summer, or as snow in winter in the Klondike region.

In proof of this, let imagination take us to old Ireland. You have bought a gun—the latest thing in hammerless choke bores, with ammunition requiring but the one practical test to which you wish to put it. You must needs go to try it in the best bit of Irish sporting country. Your pet setters are brought out with pride by the keepers; you start; and carefully beat every inch of ground from morn till eve. Snipe bogs, where in your boyhood's happy days snipe were "jostling each other," are now without a feather. On highlands too partridges are found to be "improved" off the face of the earth by the "Land Improvement Act" of the Gov-

ernment, or by the lawless act of the individual. There is, happily, always an excuse for a "blank day"—wind, weather or other circumstance. The fact of the "blank day" remains. You return home with sad reflection—your gun untested, your temper sorely tried.

Again, you have replenished your somewhat slender purse and bought a well-trained hunter at the Dublin horse show. You have honored (?) your London tailor—whose account, by the way, has not been quite settled—by ordering a new hunting coat. Your boots and breeches are perfection; your mount seems fit and eager to go; you are spoiling for a run. With a just feeling of pride in your whole "get-up," you ride in and out among friends at the meet, chatting pleasantly

THE IRISH SPORTSMAN IN MANITOBA.

the while. But not so pleasantly do you trot from cover to cover, each in succession being drawn blank; nor do you, with the morning's satisfaction, jog slowly home at evening with thoughts of another "blank day" to add to the list of such days, now growing large, and with the idea, however ill-founded, that your new hunter is "throwing out" a splint on the near foreleg—a result of excessive road riding from cover to cover. The only apparent satisfaction, in the absence of sport—the ever present excuse, "fox earths have not been properly stopped," "there has been a nasty east wind," "no southerly wind and cloudy sky," and "better luck next time," is ever ready to our lips, if it comes not from the heart.

To convey the gentle reader from old Ireland to North America, even here, in this land of game and game

THE IRISH SPORTSMAN IN CANADA.

laws, particularly the latter, have we not "blank days"?

It was my pleasure and privilege a few weeks ago, when on an Atlantic voyage to New York in one of the Cunard steamships, to make the acquaintance of a representative Irishman, a keen sportsman and a good soldier of a crack regiment of the Imperial Army. He has an enviable record both in the sporting field and in his regiment. He has shot more game probably than any man alive. He is as much at home in pig sticking and tiger hunting in India as he is in leading his county hounds in Ireland. He is never without a mount at the principal garrison and other British steeplechases, and his colors may often be seen passing the winning post well to the front. With this record, like many others of his race, with an insatiable thirst for gore, for "more worlds to conquer," there are, it appears, two niches in his ancestral hall yet to be filled, and these, he resolves, must be filled—one with the head and horns of a wapiti, the other with that of a caribou.

How often had he looked at these empty niches? How often had he resolved to go west and bay the eagerly looked for quarry. Invariably something interfered—a book to be made for the Derby, or military duty required him to go east to one of England's "little wars." At last (even that at last was slow in

coming), at last he started, though in a state of uncertainty whether to pull up in Manitoba in search of wapiti or at Newmarket, there to complete his book on the races. Suddenly, however, in his reverie, he was "pulled up" by a fall of the horse of the Irish car in which he was driving through "dear, dirty Dublin," with the result a pair of broken shafts and escape of a broken head—all which served to remind him of the "shortness and uncertainty of life," and that if a wapiti or caribou were to be bagged, no time must be lost. With this final resolve, and a telegram to his next of kin respecting the disposal of his will, he bent his steps to Liverpool, instead of Newmarket, and the good ship Etruria speedily conveyed him to New York, not without some misgivings, for he was knocked about like a football in a forward cabin in a stormy winter voyage. Of one thing, however, he felt perfectly confident, viz., of the exact spot, in caribou or wapiti, in which he meant to place the expanding bullet of his double express rifle.

Time and swift trains brought him within measurable distance of the happy hunting grounds in Manitoba; kind friends fitted him out for the chase, with food and raiment. A young farmer brought him on a rough country sled to the hunting grounds. Here the plan of campaign was strictly carried out. Here day by day and hour by hour every available likely spot was tried in vain. In vain the brand new field glasses scanned every covert. These were "blank days"—undeniably "blank days." However, there is an excuse: "It's too early in the season for wapiti." He must go East and accept my invitation for caribou hunting. Here at least in eastern Canada he will surely be able to get the exact head and horns to fill one niche in the ancestral hall. He bids a fond farewell to Manitoba, and eastern Canada is reached in safety. There is the usual preparation for the start for green woods and barrens; the usual anticipation of "lots of sport"; one of New Brunswick's best guides is secured—New Brunswick's best hunting ground selected.

There is just sufficient snow on the ground for still-hunting. Caribou are reported plentiful. While en route a fine specimen of male caribou with horns was shown, shot by a neighboring farmer. It would suit well the niche referred to. But we must beat the record. On moves the hunting party. There is a perceptible fall in the barometer, but no perceptible diminution of zeal on the part of our keen Irish sportsman. Rain sets in, but even this does not dampen his ardor. He has ere this experienced rain in western Ireland. The snow disappears, and is succeeded by slush and mud.

It matters little whether you wear cowhide lanergans or moosehide moccasins, deeper and deeper sink your feet in muck and mire.

It matters little whether you try woodlands or barrens, the barrens are barren, the woodlands are badly "mixed." Each day ends in one winding "blank." Ardor and zeal, being sorely tested, fly to the winds; the soldier, the sportsman, the believer in "making a record," returns to the roof-tree of his family. The niches still remain with open arms for head and horns of wapiti or caribou. Another lesson has been taught in this "history of a failure," "some days must be blank."

MIC MAC.

FREDERICTON, New Brunswick.

In Canadian Woods.

(Concluded from page 25.)

At 4:30 A. M. we were up and preparing to start. We abandoned most of the provisions we had worked so hard to get up, taking with us barely a sufficient supply for two days, for now we had another canoe to carry. We had to go back two miles of our upward route and then turn directly into the woods where there was no path at all. On the way the men saw a caribou, a fine one, the first seen on our trip, although tracks had been plentiful, but just then the rifle was not come-at-able. It was just as well, for we should not have shot him anyway, since we could neither eat nor carry him. While we were struggling through bushes and twisting around trees, Eugene became discouraged again and snappishly asked Simeon where the deuce we were going. The reply was: "N'importe. On suit Pierre Kiolet." (No matter. We are following Pierre Kiolet.) The words used, "n'importe," meant "no matter," but Simeon's tone meant "that is none of your business." He knew that by following Pierre we should find the place we were looking for. And so we did. An hour or so in the woods and we struck what Pierre said was Rivard's portage road. It seemed a very small road to strike, but there was a visible path, and by following it we reached our first objective point, the Bostonnais River, about three miles above its mouth. Here, just as it began to rain, we embarked and worked our way up the stream, making several short portages past shallow rapids and crossing three widenings of the river sufficiently large to be known as lakes. We took our dinner at a small logging camp, so dirty and ill-smelling that we preferred to eat outside in spite of the rain. We waited till the worst of one heavy shower was over and then started again, Pierre assuring us that there would be no more portages until we reached the long one that would bring us to Lake Travers, which lake he promised we should reach before dark. I had my doubts, having been over the route once, but we went on, and a little past the middle of the afternoon reached the head of the fifth and last lake, landing on a muddy shore, with plenty of fresh moose tracks all about. I forgot to say that near where we struck Rivard's road we had seen the track of a red deer, not very far from where I had seen one in the snow winter before last. Pierre told me that the red deer is gradually pushing eastward. At present they are not plentiful far east of the Ottawa River, are rare east of the St. Maurice and almost unknown in the region of the Batis-can.

There was no delay at this landing. It was still raining hard, and we wanted to push on, so each man promptly picked up his load and started, Pierre and I leading, as usual. He had repeatedly told us, "*Il-y-a-un chemin*" (there is a road), but when we come to it we found that his "*chemin*" was only a track that he himself had blazed when trapping, two years before. There was no road or path or sign of any, but only blazed trees enough for a

careful man to find his way by. These were sufficient for him, for his requirements in that line are small. Near the edge of the lake we passed one of my old camping grounds, the tent poles still standing, and empty tin cans and pieces of broken boxes lying about, just as we left them five years ago.

Of course the way was up hill, for we were crossing the divide that separates the affluents of those two important rivers, the Batiscan and the St. Maurice. Aside from this it was not very difficult, being through a hardwood region where the undergrowth was not very thick. At length, however, I thought we had done enough for one day, and finding a good place for camping, and the rain still falling, I called a halt. The tents were quickly set up, and no one was sorry to get under cover.

During the night the weather changed to cold and windy. An early start brought us to Lake Travers in the forenoon, but only to be disappointed in our fishing, for the wind had risen to a stiff breeze, and the best part of the lake for fishing was on the exposed side. We spent an hour of valuable time in trials, but with no success. My plan had been to camp there and have a morning and evening for fishing, but the weather upset it.

Crossing Lake Travers in the teeth of the gale, we came to Lake Long, which, being narrower and lying almost at right angles with Lake Travers, was less exposed. From this a carry of a few yards took us into the Lac des Isles.

Nearly all the names of lakes that I have mentioned are common to scores of lakes all through this country. It is easy to see how they may have come by them. Imagine one French-Canadian telling another how to go from one point to another. Starting on one route, for instance, he might cross a lake of very clear water, which would be Lac Clair, the next would be a long, narrow lake, Lac Long. From this he would go into Lake Montauban, of the origin of whose name I am not certain, but there was once a military engineer of that name in this country, and on the shore of that lake some acquaintances of mine once found some broken weapons and pieces of crockery and cooking utensils, both French and Indian. There is very probably some connection between the name of the lake and these relics.

From there he would cross Lake Nicholas, where Nicholas Andette made the first logs, and would next come to two little lakes, à la Vase, Mud Lakes, and so to Lake à la Truite, Trout Lake, where there was good fishing, as we have seen. The next would be Lake à Vierge, where a man of that name had a logging camp. Passing by the rivers à Pierre and Batiscan, whose names I cannot now account for, he would pass the mouth of the River Bostonnais, so called because its whole length is on property owned by Americans, and in former times all Americans were known as Bostonians. This comes from the military expeditions against Canada, organized at Boston, especially the one of Sir William Phipps. There is another and larger river in the Province that has the same name, and from somewhat similar circumstances. And so he would go on. A crooked lake would be a Lac Croche, a round one a Lac Rond, one lying across his way a Lac Travers, and one with islands in it a Lac des Isles. The lakes might continue to be known by these names until something occurred to give them others, as in the case of renaming Lac à la Truite.

On the Lac des Isles the wind for a time was more moderate. Shortly Pierre's Indian eyes discovered something moving far away down the lake. It proved to be a Canadian gentleman and his two Indian guides in a fine new canoe, fresh from the Penobscot River, which contrasted strangely with our worn and battered ones. We did not covet his canoe, for ours were wider, and would carry heavier loads, and we thought them safer. He was camped at a considerable distance away, and only out for a day's excursion. After a little chat we went our respective ways. These were the first persons I had seen, except our own party, since leaving Lake Clair.

Soon the wind rose again and blew harder than ever. The lake was covered with white caps and Pierre could make scarcely any headway. I thought we should have to try to get to the shore and wait, but he worked us up to a bit of a rocky islet and took the spare man from the other canoe, to the advantage of both. We got on better after that, but the next half-hour was a rough one, though the canoes behaved splendidly, and Pierre was delighted with ours.

At length our battling with the waves came to an end and we arrived at the outlet of the lake, where we found an immense lumbering camp, owned by an American company. It was a surprise to all but Pierre. Everything was substantially built and in perfect order. Camp, stables, storehouses, kitchen, with table room for fifty men at the least, foreman's room, in short the whole equipment was most complete. The dam at the outlet was an especially fine piece of work. Everything indicated the controlling minds of men of business experience and foresight, ample capital and an intention to conduct affairs on a large scale. And this they do, for I was told they make not less than 800,000 logs per annum. Later we found that roads, bridges, etc., were all planned with the same leading idea, that of economizing human labor by utilizing it to the best advantage and not wasting it. The storehouses were stocked with sufficient supplies to enable lumbering work to be commenced at the earliest practicable time. These had been brought up towards the end of the previous winter.

The gale continued, and we began to feel uneasy about the people in the canoe we had met, but while we were at dinner they came in gallantly, the canoe riding the waves like a duck and dry as a bone inside. The owner was greatly pleased with it, which I was glad to know, for we have one precisely like it at Lake Clair, but have not yet given it any hard work.

Up to this time we had been, except when on lakes, constantly working against currents, but now we should have them in our favor. We got away promptly, taking one rather long portage to avoid, as Pierre said, three shorter ones. But we had not quite reached the end of it when we saw the other canoe, which started after us, go past us like a shot. They had the advantage of having no loads but what they could pick up quickly and march off with, while we were encumbered. Near here our ways diverged and we saw them no more.

For an hour or more we wiggled over shallows and sunken timber, the men sometimes in the canoes and sometimes wading alongside and lifting them. At length

we rounded a point and were told we were in the River L'Eau Morte (Dead Water). For a little while we went along nicely, but it was not long before I began to wonder where the "dead water" was coming in. It was the liveliest dead water I ever saw.

All the afternoon we had a succession of rapids, with only short stretches of good water. Some were run with canoes and baggage, some by canoes alone, and some portaged altogether. It began to be late when we came to a place where Pierre said we should be sure to find some caribou horns, a place where many caribou came to shed their horns in the season. That they should come together or seek a certain place for this purpose was news to me. It was a bit of level land, wooded with small firs and the ground covered with white moss. He went ashore and searched some time, but found only a pair of old ones, fine in their day, but now bleached and cracked. We took them on board, but when it came to a question of portaging we abandoned them.

We were now having fine canoeing water, but presently came to the head of the wildest rapid we had yet seen. As it was a mile and a half long and the sun was just setting, we decided to camp there, and on going ashore found we were just at a place where shelters had been erected for log drivers. They were like two low sheds placed facing each other, and like all the company's works were substantial and extensive, furnishing sleeping quarters for, I should think, seventy or eighty men. We needed only a little fire for cooking, which we built between the sheds and were thus housed with great promptness. Wood, all ready for use, was right at hand, and we had little to do but collect a few boughs to freshen up our beds. Simeon found a half-dozen or so of dynamite cartridges in rather unpleasant proximity to our fire, and promptly threw them out into the bushes. They were probably intended to blow up obstructions in the river that caused logs to jam, or even to break up a jam itself, a proceeding occasionally necessary. Pierre was charged to report our disposition of these fireworks (as well as our use of the camps) to the foreman of the works, so that he might replace them if desired.

We were out early the next morning, realizing that we had a big day's work before us. Everything was portaged past this rapid, but we had one of the company's roads, and got on without trouble. Embarking below, we had ideal canoeing for several miles, an even, moderate current, no obstructions and the weather and scenery lovely. Pierre and I led and the men followed, talking and singing heartily for almost the first time since leaving the Batiscan. It was delightful, but ended altogether too soon, for by and by Pierre pulled up to the shore at a bit of low, grassy land. I could not discover any reason for stopping at that particular spot, but was no sooner ashore than I found that exactly here was a path that a few yards further on resolved itself into a portage road. Half an hour's walk brought us to a little lake whose name I forget, and then another half-hour to Lake Maketsy, a fine, large lake, the fishing rights on which are held by some Three Rivers gentlemen, who have a fine club house on it, very pleasantly situated. We passed on the opposite side of the lake, and did not visit it. Crossing this lake, which discharges into the Batiscan River, while all the other waters traversed to-day flow into the St. Maurice, we ate our last provisions, repaired our old canoe, which now required much patching and coddling, and continued on our way. After about another half-hour's walk on a bad road and all up hill, except the last few minutes, we came to another small lake, after which came another carry of something like the same length, and we reached Lake Long, the last of importance on our route. This is a very beautiful lake, nine miles in length and averaging say three-quarters of a mile in width, the northerly bank about 250ft. high, very even on the sky line and almost as steep as our own Lake Long, covered with evergreen trees from the water's edge. It seemed as steep as it could possibly be, and have timber on it. One realized its height and steepness when passing some places where the trees had been cut away to allow logs to be rolled down from the top into the lake. Pierre kept up his even stroke, steady as a clock, for the seven miles we had to go, stopping only twice, long enough to light his pipe. He said we should make the distance in two hours, and was only five minutes out of the way.

We went ashore at a point where we found a large storehouse, boats and the accompaniments of extensive lumbering works. We also found the end of a cart road, at least that is what Pierre said it was, but I should pity the cart that had to go over it. Here we abandoned our old canoe, putting up a notice that whoever found it was welcome to take it. The men took up their lightened loads cheerfully and walked along. Pierre and I ferried the baggage over a little lake called Lac en Coeur (heart shaped) behind the hills, on one side of which Pierre said were two houses, the very outposts of civilization in that region. Of the inmates of one of them we already knew something, an interesting story that I cannot tell.

But a further walk of an hour and a half or so brought us to a barbed wire fence, a railroad, supper under a roof, children, flies and other evidences that we had left the woods behind us.

At 1 A. M. I was at home, at 1:30 in bed, and at 8:30 on hand to meet my engagement.

I had said that this would be the last journey of the kind that I would make—but—but—Isn't it almost as difficult to keep a lover of forests and streams away from them as to keep a sailor away from the sea?

G. DE MONTAUBAN.

QUEBEC, December, 1898.

Law-Making and Law-Breaking.

WE have often expressed the opinion in these columns that it is generally wiser to enforce the existing laws for the protection of animals than to ask for new legislation, and we rejoice that our esteemed contemporary, *FOREST AND STREAM*, holds similar views. The good people of the State of Wyoming are agitating the question of an appeal to the Legislature "to remedy the defects in the statute by which constant raids on the game supply have been perpetrated." *FOREST AND STREAM* of Dec. 10 declares that "what is needed in Wyoming is not so much a new law as upright, straightforward, and determined officials to enforce the one already on the books. * * * The law," says the editor, "is all that could be asked, if it were only enforced; an ounce of execution is worth a hundredweight of amendment." Over-zealous friends of the cause of animal protection find it hard to realize that special laws to punish specific acts of cruelty may often defeat their purpose by failing to cover the ground of a more general law. At all events, would we not better enforce those laws we have before enacting others we may have no need of?—Our Animal Friends.

Natural History.

Florida Great Blue Herons.

MANY of the birds of Florida are rapidly following the dodo and the buffalo. Many hunters from the North come to Florida for a few months of outdoor sport, and soon degenerate into plume hunters for the money that is in it. Law-breaking native hunters have regular outfits for this traffic, and not only hunt themselves, but encourage the Seminoles to procure egrets for them. The Indians are innocent of the violation of the law, and tell of the rookeries that have been annihilated during the past year. One small-rookery, near the camp of the Cow Creek Indians, was completely destroyed by a white man from a South Florida town this spring, the hunter securing the plumes of 100 egrets. The Indian in relating the circumstance said, "Little birds cry, cry, all day. No water. No fish," till the little Indian boys caught minnows for them, and daily climbed the lofty trees and fed and watered the young egrets—a tribute to the savage mind over the cruelty of the civilized and Christianized white man.

A few years ago Florida was an ornithological Eden—all flying creatures of the North American continent had a rendezvous in the southern section of the State. The Everglades are the winter asylum of nearly all the migratory birds of the eastern seaboard. It is only a very few years since in the "bird islands" or rookeries the community numbered thousands, including the large white crane, the blue heron, the curlew and many other water birds. But "aigrettes" are the fashion, and the boast of a plume hunter that he and his party had killed 130,000 birds off the coast of Florida in a single season shows to what extent vanity "plumes" itself, both at the expense of a violation of the law and the sins of men. But until lovely, gentle woman shall cease to adorn herself at the sacrifice of the mother bird and a nest of helpless young left to starve, the traffic will be carried on.

The law passed in Florida for the protection of the mockingbird is already showing its good effects. In Kissimmee the mockers build their nests in the oak trees that line the principal business street. All day long they sing, while on moonlight nights the quiet of the little town is only broken by the songs of this forest minstrel.

The testimony of the leading scientists of the United States shows that unless the killing of birds soon ceases certain of the feathered tribe will become extinct. Where formerly countless thousands congregated in the rookeries in Florida, the Indians tell that the rookeries, "hi-e-pus" (all gone). While there is not one heron or egret in Florida to-day, where there were thousands twenty years ago, yet if properly protected, their graceful forms would ere long be seen giving life to the water courses, lakes and prairies. The snowy figure of the egret would be seen wading in the shallow streams quietly seeking his meal, and the big blue heron, in dreamy attitude, resting on one foot, would wait by the water's edge till hunger bade him seek his evening repast.

They who know only the wild herons of Florida will be much surprised to learn how charming, how full of confidence, these same birds can be under habits of domestication.

Three years ago a hunter captured from a nest on the bank of the Kissimmee River three young herons of the great blue heron species. They were purchased and turned loose in the yard. They were certainly far from prepossessing in appearance; almost bare of plumage, with long legs scarcely able to support the slim body that seemed burdened with the wide-spreading wings; long beaks and yellow eyes; while their feet, how mirth-provoking it was to note their large proportions. They grew rapidly, however, and in a few months a tuft or crest of feathers adorned their heads; long silk-like feathers appeared on the breast and on the back; they had taken on a light gray color, with the plumage on the head and breast streaked with white. Standing 4ft. in height, with every feather ruffled at the approach of any object of dislike, they were very formidable looking birds. While they had been taken from the same nest, the female from the first showed an antipathy toward the odd male, making his life one of constant retreat. She was more slender and gentler in appearance than the male birds, but was ruler of the yard. She kept constantly by the side of the bird of her choice, but ruled his every wish, so much so that the pair were named Mr. and Mrs. Caudle. They were fed exclusively on fish and beef, and when Caudle by chance secured the first bite, she immediately ran to him and took it from him. The odd bird, whom we named Snapper, dare not come within range of the pair, but watched for his dinner, grabbing it and running, for Mrs. Caudle would pursue him around the house unless she was kept occupied with her own food. The surprising part of this strange dislike was, that it was the female who took upon herself the part to browbeat Snapper. He became so completely cowed that he occupied a different part of the yard, except at night, when that instinct to band for defense brought the herons in the one yard and the cranes in the other to a mutual meeting ground, with only a wire fence between; but with dawn came all that pugnacious feeling again, when Snapper took his old post, standing silent and dejected till the return of night. During feeding time he stealthily got himself a place of safety, where sympathy for his hard lot secured him many an extra morsel.

The digestive power of the heron is remarkable, as well as its capacity and ability to swallow large fish. The neck seems to expand as if made of India rubber—the fish slips down and the bird is ready for another. In feeding beef, large bones were given, which were swallowed intact. On one or two occasions after feeding beef this way, great alarm was felt, as the birds showed signs of great distress, but the uneasiness was soon calmed when the bird threw up a large bone, clean and white, the meat having been thoroughly digested. In feeding catfish, they instinctively pierce it with their strong beaks, until there is no question in their simple minds but that it is harmless. If, in their hurry to swallow their food, it goes down the throat covered with sand or trash, they

The Growth of Trees.

Editor Forest and Stream:

My attention has again been directed to the subject of the growth of trees by the following question: "Was Mr. Hardy right in saying that a branch or notch does not rise higher with the tree's growth?"

Again I must confess my inability to speak with decision and authority upon the question at issue. I can only give my own impressions, or deductions, concerning the matter. I do not doubt that Hermit can give specific and definite information on this point, and trust that he will take occasion to do so.

My own impressions I give as follows: During the earlier stages of many vegetable growths, the process of growing is carried on without the agency of leaves, as in plants that push up mechanically the "seed leaves" through the soil. It is evident here that nearly, if not all, the material used comes up from the ground, and there is, of course, a progression upward of the matter incorporated by the plant. When, however, the plant is provided with leaves, and the bulk of its substance descends from the upper extremities, having been assimilated from the atmosphere through the agency of the leaves, it is my belief that every particle of the plant that has effected a lodgement anywhere in its corpus remains permanently in the same lateral plane where it is first posited. If in the vertical trunk, it remains at the same distance from the ground. If in a branch, at the same distance from the heart of the trunk, measured along the axis of the branch.

The process of growth is by new excentric rings formed around the central axis of trunk and branch, enveloping former growth without disturbing its position; while new material is piled on top of the old in progressing to greater height.

It is a matter of common observation that small trees have branches much nearer the ground than the same

A SPOTTED ADIRONDACK DEER.

trees will have at a later period of their growth, after attaining much greater height. This is especially true in a crowded forest, where the leaves on lower branches would be much curtailed for lack of sunshine in performing their functions of laboratory work to maintain the growth of their parent tree. It is also noticeable that on the margins of forests the outside trees eagerly spread out branches into the open space much lower down than the interior trees. But what becomes of the low branches of the young trees, which have disappeared after maturer growth?

They die from atrophy and drop off, the remnants being overlaid by successive annual growths after their decay. It is one of the commonest principles of nature that organs waste and become merely rudimentary, when their functions cease to be exercised; as for example, witness the rudimentary legs in the bodies of boa constrictors, and of hind legs in the bodies of whales, showing that they once were quadrupeds, before the snake discarded his legs by too much proneness to the sneaking habit; and the cetacean was driven into the sea by his enemies on land, or for other good and sufficient reasons forsook the latter element for the former. The whale, by the way, exhibits a curious reversal of the general order of animal life progression, the initial state having been in all cases aquatic, with a subsequent development on dry land, at least in the higher orders of animal life. The "gill slits" are still visible in the embryo of the human species.

The exposition of the force exerted by a growing squash in the last FOREST AND STREAM is quite convincing, and again brings to mind the moral that there are more ways than one of viewing almost all questions.

COAHOMA.

The Seaboard Air Line.

PRINCE BAY, Staten Island, N. Y.—*Editor Forest and Stream:* In reading the last issue of FOREST AND STREAM I took particular notice of the "Seaboard Air Line." Mr. Wilmot Townsend being a shareholder, I believe, and situated on one of the principal stations of the route, claims that the dividends this year meet with his most sanguine expectations. Well, there are others who have noticed the dividends seem to be on the rise. Especially is this so where I am situated, near the lower end of Staten Island, and an important station, in consequence of getting ready to use the "High Bridge" between here and New Jersey. If I could pen my thoughts as well as Mr. Townsend, I could make it quite interesting for the readers of FOREST AND STREAM, as this section of the line is a terminal of the Hudson River Air Line, a sort of junction of the two, therefore we have plenty of feathered friends in the fall. But, I will have to take Mr. Fred Mather's ad-

vice, write any way and let the editor grind it out to suit himself, "blue pencil" accept or reject.

The last fall birds of all kinds have been especially abundant, noticeably robins, which have been shot off in great numbers. We have no game protectors on this end of Staten Island, and the one at the other end probably has his hands full. One morning in October, while going to my employment, I met a man (I think at one time he may have been a subject of a foreign country) with gun and three or four dogs, mongrels, of course, and I said: "Good morning; going for game?" "I take my gun by the wood," he responded, "an' I shoots any t'ings I see, eh!" and that is the case all over this lovely island, which is a natural paradise for our feathered friends. I go to the woods and fields Sunday mornings with my field glass to watch the birds and study nature in general; and it's bang, bang all the time. But we are in Greater New York now, and things may be different some time, but it will not be. When the robins nest again." Oh, no.

A. L. H.

"Old Red Legs."

CALAIS, Me., Jan. 10.—*Editor Forest and Stream:* I notice in your paper of Jan. 7 an article by Mr. Wilmot Townsend, about a large dusky duck called "old red legs." I have three very like what he describes in my mounted collection; but the bird is never found late in the fall, always found in summer. I had thought it a new duck, as I could not find it described in any of my bird books; even Audubon said nothing about the change of plumage in summer of the mallard drake. But being out in Minnesota and Dakota in summer, where mallards were plenty, I found my strange ducks to be mallard drakes in summer plumage, and at times you can hardly distinguish the male from the female.

About May 20 the breast and back of the drake begin to change their color; in a short time the curled feathers above the tail drop out, and gray feathers appear among the lovely green plumage above the eyes. Every succeeding day brings marks of rapid change, and by last of June not one green feather of the head or neck is to be found. Early in July every feather of the former brilliant plumage has disappeared, and the drake has received a garb like that of the female, only a much darker tint. In August this new plumage begins to change gradually, the curled feathers above the tail begin to grow, and by Oct. 20 the drake appears again in all his magnificence to charm the eye of man. Thus, we may say, that once every year for a short period the drake, as it were, goes into an eclipse; and a full plumaged wild drake cannot be found anywhere, and I think Mr. Wilmot Townsend's duck, red legs, is a summer plumaged mallard drake.

I have seen a good many of those ducks in collections, and marked a cross between them only in confinement. The wild birds seldom cross, and all I have seen are summer plumage drakes. I wrote FOREST AND STREAM about the summer plumage of the wild drake a good many years ago, but many of the late readers have not seen it.

GEO. A. BOARDMAN.

Beaver in New York.

MR. W. C. McNALLY, of the Ellenville Press, Ellenville, Ulster county, N. Y., writes under date of Jan. 12: "Thinking this item, which is taken from our paper of today, may be of interest, I enclose it:

"Mr. Leroy Haden captured a beaver near the Grand View stock farm Saturday morning. This is the first beaver caught in this vicinity in a great many years, and a good many went to see the strange animal."

"The farm mentioned is about ten miles from here, on the Lackawack stream, and about eight miles from where it joins the Sandburgh to form the Rondout, the streams uniting near Napanoch, which is twenty-six miles from Kingston. The stream is a natural trout stream, but pretty well fished out, though the Sundown Club has recently put a number of thousands of brook trout in it, on land which they control, several miles above Lackawack. Of course you will understand these streams run out of the Catskill foothills.

W. A. McNALLY."

A New Magazine.

We learn that in February next the Macmillan Company will begin, under the editorship of Mr. Frank M. Chapman, the publication of a popular bi-monthly magazine, to be called Bird-Lore, addressed to observers rather than to collectors of birds. The magazine will contain general articles on birds in nature, supplemented by departments, entitled Notes from the Field and Study, Hints for Teachers and Students, with an especial department devoted to children. Especial attention will be given to bird protection work, and the magazine will be the official organ of the Audubon societies. The list of those who have promised contributions includes many of the best known names of observers and writers on birds.

A Spotted Adirondack Buck.

HOPKINTON, N. Y., St. Lawrence County, Jan. 3.—*Editor Forest and Stream:* I enclose photograph of a freak of nature, a white or spotted Adirondack buck, killed in October, and the mounting just completed. This buck was said to lead a charmed life; he has been seen and shot at frequently for the last seven years, and only once has he been hit as far as anyone knows, and that was out of season, and the hunter was complained of by log cutters, and paid a fine of \$50.

C. H. B.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

immediately eject it, carrying it to the water, and having rinsed it well, swallow it again.

The birds all seemed to love companionship, and would stand for hours by the kitchen porch as still as if carved out of wood, the only motion being the ruffling of their plumage by the breeze. They were always exceedingly shy of strangers, and yet so well had they learned the two words, "Come on, come on," that they would respond to any voice that called them, and with heads erect timidly approach, while the same words from their master would bring them, half-running, with wings extended, expressing their pleasure by a satisfied "Qua, qua, qua," the only language they seemed to possess. Many times during the day would the pair demonstrate affection toward each other. Beginning with that "Qua, qua, qua," they would turn beak to beak, their long necks distended, yet arched, and with beaks interlapping caress and "kiss" with a degree of happiness that would turn many a lovesick Lothario green with envy. All the while stood poor Snapper, solitary and forlorn, with "no one to love, none to caress."

Just at this point the writer recalls sounds that greeted her one morning before arising. One of the birds had been caught to give his wing a second clipping, during the progress of which he kept up a continual noise, so like the bellowing of a calf under the torture of the branding iron that it was not until after we had given vent to our feelings at the "cruel practice" and "unnecessary length of time" that the supposed cowboy had applied the branding iron, that we learned that the heart-rending sounds was only the voice of Snapper objecting to being held while his wing was being clipped.

The occupants of the yard each seemed to possess a language understood by each other, yet Dick, the crane, was the bugler for the company. At his note of alarm on the approach of a strange dog, the herons, with scarcely a perceptible motion, would, with heads erect, glide backward to the furthest corner of the lot, and as long as the crane "called," although the enemy might be out of sight of the herons, they kept that erect, frightened position. Then let the crane give his call of greeting on the approach of his master, and quickly the three herons, with an awkward, half-running humpbacked gait, would make for the wire fence and there wait patiently for the approach of the home comer. The whinny of the horse or the mewling of the cat reminded the birds of the meal hour. An unusual jabbering among the jay birds or a frightened cackling from the chickens would alarm them and they would move stealthily about as if wondering where and what the enemy might be. During the writer's absence from home for a period of several weeks, the master of these shy birds educated them to a point that threatened to distract her peace of mind. They had gradually grown more gentle and less timid, until on my first evening home Snapper stood at one corner of the dining table, near the French window, through which he entered, while the other two birds stood, neck and neck, at the opposite angle near the open door. They were so badly spoiled that when we put them out at one door they would naturally walk around the house and come in the front way, traversing the length of the house with heads up and stealthy tread.

One day, the dog rushing around the corner surprised Caudle, and he slipped and fell as he went down the steps. His back was broken, and he lived but two days, his mate standing by him till he died. After his death he seemed lonely, but still refused to allow Snapper to come near her. This went on for a while, when suddenly he approached her with a "Qua, qua, qua," showed her that he intended to be master, and from that time on they were as congenial as two birds could be. They certainly could not be called intelligent birds, but this degree of domestication was considered by hunters who have lived in the woods all their lives to be simply remarkable. Finally their wings grew out, and Snapper was permitted to go. The wing of the female was not quite long enough to allow her to fly, and the male returned day after day to urge her to come. At length she was driven to the cypress forest at the back of the town, where they lived and fished in the ditch, and still frequent. Negroes living near were warned not to touch them, and for a long time after they would approach very close to passers by. Morning and evening they yet fly across the lake, happy in their freedom, none the worse and perhaps none the better for their domestication; but they have added one more chapter to Natural History, and instilled an intellectual and moral sympathy into the minds of all who saw them. Many times during their captivity came the pleasing remark from hunters and visitors, "Well, I can never again shoot a big blue heron."

MINNIE MOORE-WILLSON.

KISSIMMEE, Fla.

Crow Roosts.

For some time past Mr. Witmer Stone, of the Academy of Natural Science, of Philadelphia, Pa., has been collecting data relative to the winter crow roosts in eastern Pennsylvania and New Jersey, with a view of preparing a paper on the subject.

Mr. Stone finds it difficult to obtain sufficient reliable information to properly cover the ground, and would be greatly indebted to readers of FOREST AND STREAM who might be willing to communicate to him any knowledge which they may possess on this subject.

He has located and obtained satisfactory accounts of the following roosts:

1. Merchantville, N. J.
2. Woodstown, N. J. (Salem county).
3. Sharpstown, N. J. (Salem county).
4. Near King of Prussia, Montgomery county, Pa.
5. West of Coatesville, Chester county, Pa.
6. Mountville, Lancaster county, Pa.
7. Near New Holland, Lancaster county, Pa.

Mr. Stone does not doubt there are many other roosts in the States, and information relative to their location could be very gratefully received, also the direction of flight of crows at evening from any points in eastern Pennsylvania or New Jersey, as this is of great assistance in indicating the location of the roosts.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Game Bag and Gun.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

The Lacey Bill.

WASHINGTON, D. C., Jan. 12.—The House bill extending the powers of the Fish Commission over birds, with the Senate amendments preventing the importation of feathers, and the transportation of birds from one State to another, came up in the House of Representatives to-day, on a motion by Mr. Perkins, for the appointment of conferees to meet with those already appointed by the Senate. An unexpected attempt was made by Mr. Cannon, of Illinois, chairman of the committee on appropriations, to kill the bill, on account of the increased expense, and because he thought the various States should take care of their own birds. The House defeated his motion to postpone the bill indefinitely, however, by an overwhelming vote, and conferees were appointed. Mr. Lacey, the author of the bill, stated his purpose to secure a modification of the Senate amendments, so as to meet the point raised in the editorial reference to the matter in this week's *FOREST AND STREAM*. The debate in the House, which was quite spirited and interesting, is well worth reading. It was as follows:

Game and other Birds.

Mr. Perkins: Mr. Speaker, I ask for a conference report on the bill (H. R. 3589) to extend the powers and duties of the Commission of Fish and Fisheries to include game birds and other wild birds useful to man. I ask that the Senate amendments to the bill be disagreed to, and that the conference asked for by the Senate be agreed to.

The Senate amendments were read.

The Speaker: The gentleman moves that the House non-concur in the Senate amendments.

Mr. Cannon: Mr. Speaker, I have not a copy of the Senate amendments before me, nor am I very familiar with this bill. I should be glad to have the gentleman from Iowa make a statement about it. Has some legislation passed touching the birds?

Mr. Lacey: The bill passed the House under suspension of the rules on the last suspension day, extending the powers of the Fish Commission so as to make them relate to birds, in a way somewhat similar to that by which they now relate to fish. The Senate have passed that bill, but have added an amendment in regard to the transportation and importation of birds for ornament. The bill has evidently been amended in a manner broader than its framer in the Senate contemplated. In other words, I think the way the bill now reads, the amendment in the Senate would prohibit the transfer of a live song bird from the State of Kentucky to the State of Illinois, or the transportation of an ostrich feather from Baltimore to Chicago. I think there has been a mistake in the framing of the second section of that bill. Of course, that was not intended by the Senate amendment. It can readily be corrected in conference.

Mr. Cannon: Now I would like to ask the gentleman just what does the bill propose to do with the birds?

Mr. Lacey: That matter was explained the other day, when the bill was passed by the House.

Mr. Cannon: But, like many others, passed under a suspension of the rules, with twenty minutes for debate, and that is equivalent to not much knowledge on the part of the House.

Mr. Lacey: The House had full knowledge of it.

Mr. Cannon: I would say to the gentleman, frankly, that I would like to hear him; but it seemed to me that this legislation was a little strange. I have an impression, and it is only an impression, that it puts the birds of the country under the Fish Commission. There are people who think the Fish Commission has outgrown its usefulness; but there is no doubt the Fish Commission has grown in expense. I do not desire to make any attack upon it, but the effect of the legislation would probably be to double the expense of the Fish Commission, without any very considerable profit to the people of the country. I would be glad to know what this scheme contemplates, because if it has not been properly considered by the House or the House being fully informed as to what the scheme is, the House can stop at any time.

Mr. Lacey: Mr. Speaker, I do not know whether the chairman of the committee on appropriations was present when this bill passed under the suspension of the rules the other day or not. The chairman of the committee on ways and means was present, and demanded a second, in order that a full explanation of the bill might be made to the House. A full explanation was made.

Mr. Walker, of Massachusetts: What was it?

Mr. Lacey: Now I know that the chairman of the committee on banking and currency was not present, or he would not ask that question. But I am pleased to inform gentlemen of the general scope and purpose of the bill a second time within a very few days. The bill we passed perhaps explains itself better or as well as I possibly could do, and I commend it to the attention of my friend from Illinois, whose State has utterly destroyed bird life in the State.

Mr. Hopkins: The gentleman is mistaken.

Mr. Lacey: There are very few birds in that State.

Now there can be no appropriation for this useful purpose without some general law authorizes it. The appropriation is an annual one, and if on trying the experiment it is found that it does not work satisfactorily, all that needs to be done is to cut off the appropriation.

It is not like creating a new bureau, that must go on and transact business anyhow, when salaries must be paid; but this is an additional service, from the same persons, who already have most of the machinery to carry out this purpose in their control, and the subsequent appropriations will depend upon the success of the proposed operations.

I can say, Mr. Chairman, that this bill has attracted a good deal of attention on the part of the bird lovers of the United States, and every man with a good heart is a lover of birds. Every schoolhouse ought to be a training school, teaching boys to protect the birds of this country. [Applause.] I know when I was a small boy the air was fairly filled with birds that have now almost disappeared. It is not a matter to be laughed at in the House of Repre-

sentatives. People stood by and laughed while the American buffalo disappeared from the plains of the West, and a national crime was there committed, a disgrace to American civilization. The whitened bones of that splendid animal have been gathered together for fertilizers. Animals have been slaughtered for their hides, and they have been swept from the face of the earth. A small space was set apart to save these splendid mammals some years ago, and a few were placed in the Yellowstone Park. But it was discovered a few years ago that there was no law protecting those animals, and that men climbed down the sides of the mountains in the winter and slaughtered the buffalo, and sold their heads for \$250 apiece. To-day there are not over 100 or 150 living buffalo in this country; and yet only a few years ago railroad trains in the West had to stop until the buffalo herds had passed. Flocks of birds that used to fly about the marshes of Illinois and Iowa have been swept almost from the face of the earth, and on every hand, from every hamlet, a cry has gone up that something ought to be done to stay the destruction of the song birds that made beautiful the homes of our country in the summer.

We witness the flight of birds passing by in the spring and in the fall, birds of passage, and the pot-hunter goes out and slays them as they go by. It is time that a halt was called on the wholesale destruction of our feathered friends. This is only a small step in that direction, but it is a step that will do good. Take the splendid grouse of Oregon, they are abundant there yet. Turn a few hundred of them into the valley of the Shenandoah and they will be protected by an intelligent public sentiment, because they will be looked upon, not as a few birds placed there by sportsmen, but by the hand of an enlightened Government, and the pot-hunter will be compelled to stay his hand, and they will begin to be propagated in States to-day where they never have been known. The sentiment in my own State has grown up of late years very strongly for preserving what few of these feathered friends still remain, but as far as some of the States are concerned it is like locking the stable after the horse has been stolen.

Now, this purpose is tentative in its form, but it is no experiment. Many enlightened communities in the old world have fish commissions and game wardens combined in the same hands, and the same persons and the same appropriations are made and used to fill again the rivers with fish and fill the air again with feathered game. We ought not to be behind in this matter. It is not a proposition for an appropriation, it is simply a proposition to pave the way for my friend from Illinois in the future, when he will be glad to put in an adequate appropriation for this purpose. There are streams to-day that are again fairly well filled with fish that a few years ago were absolutely barren.

In the State of Connecticut 150 years ago, when an apprentice was bound out, they put in the indenture a provision that he should not be required to eat salmon more than twice a week, knowing that if that was not in, the Connecticut farmer would make him eat salmon seven times a week and three times a day. Now salmon is worth 75 cents a pound. Take terrapin in Maryland. Years ago it was so plentiful that they had laws to prevent the too economical masters from making their slaves live upon it; and now, Mr. Speaker, where is the terrapin? [Laughter.]

This is no laughing matter, although we may laugh at the absurdity of terrapin being so plentiful that laws had to be passed to prevent the slaves from being fed upon them.

Mr. Grosvenor: Does the gentleman think there could be any commission under the auspices of the Government that could tell terrapin when they met it? [Laughter.]

Mr. Lacey: I have no doubt that a select committee could be obtained from this House that could tell terrapin provided they got the terrapin early enough in the banquet. [Laughter.]

Now, Mr. Speaker, in the case of the buffalo the people waked up; but they waked up after the buffalo had disappeared. Many of the birds remain, and this is a step toward their preservation and protection.

The only question, Mr. Speaker, before the House is as to a conference upon the amendment added to the bill in the Senate upon the motion of the distinguished Senator from Massachusetts, who added, by his motion to the House bill, a bill pending in that body. That proposition is one in which I have hearty sympathy, and I believe is a wise supplement to the bill as it passed this House, but there are some portions of the language of that bill that ought to be corrected, and this conference ought to be agreed to.

For instance, Section 3 prohibits the transportation of birds to be used or sold from any State or Territory of the United States to or through any other State or Territory in the United States. That is too broad. It is capable of a construction that evidently never was intended. The object was to prevent the indiscriminate killing of song birds for hat ornaments and other ornaments, and their importation into this country, the transportation from one State or Territory to another. The first section is drawn so that there will be no difficulty about it, but the second section is broad enough to prevent the transportation of a red bird, for instance, from the State of Kentucky to some other State. I might say to my friend from Ohio that I understand that his State has honored itself by passing a law absolutely prohibiting the keeping the red bird in a cage at all. They have recognized the fact that that bird will soon be rendered extinct, unless it is allowed the free air of heaven; and the boys which have been in the habit of catching it are compelled to abandon their practice. In the State of Ohio the red bird has been turned free by the State itself.

Now I think that this bill ought to go into conference, in order that any inequalities as to these amendments can be cured, and I shall feel very confident that my friend from Illinois will, in the next Congress, see to it that adequate appropriations are made to give this matter a fair trial.

Mr. Cannon: Mr. Speaker, I have listened with great interest to the gentleman from Iowa (Mr. Lacey). In a word, what does this bill propose to do if enacted into law? Take the House bill. I agree to the criticism which the gentleman makes on the Senate amendments. If the bill is to pass at all it ought to go to conference, and the Senate amendments ought to be eliminated or modified. There is no contention between the gentleman

and myself touching that point. But as to the House bill, let us see what it proposes to do. Under it the United States Commission of Fish and Fisheries is hereafter to be known and designated as the United States Commission of Fish, Fisheries and Birds. Now we all understand about the United States Fish Commission. It does a great work. I was not a member of the House when that work was first authorized; but from the time of its inception to the present the appropriations for it have been justified upon the ground that the water courses of the country no longer bear the fish that they formerly did; and it has been demonstrated that they can be replenished with fish by a judicious expenditure of money under the direction of the Fish Commission. The various States—at least most of them—have fish commissions, which are doing valuable work. It has been stated time and again that, acre for acre, the water courses of this country and the waters along our coasts are as valuable in the production of food for the human family as if they were fine agricultural lands.

I have no war to make upon the Fish Commission. I have thought at times that in many respects its work has not been conducted wisely. Fish hatching stations have been scattered over this country at points where the results do not justify the expenditure. They have been established where there was not water enough to run them, so that great expense has been incurred in procuring water, and even then in many cases it has not been obtained in sufficient amounts; and in certain cold sections of the country they have been obliged to heat the water. [Laughter.] But I am not here to discuss the work of the commission or to complain about it. Upon the whole it has rendered good service.

But how do you justify that work? You justify it because it is for the purpose of furnishing food to millions that may be able to gather the fish from the waters of the sea coast and the great tidal rivers and the inland rivers. The Fish Commission serves a good purpose; and we are going to continue it.

Now what does this bill do? It proposes to extend the jurisdiction of the Fish Commission so as to include the propagation and care of birds. It creates machinery for this purpose, ramifying into nearly all the States. On this subject the bill provides:

The duties and powers of said Commission are enlarged so as to include—

Include what?

The propagation, distribution, transportation, introduction and restoration of game birds and other wild birds useful to man.

How about propagation? For this purpose there are needed aviaries, incubators, etc. The scientific gentlemen, of course, know all about how eggs should be hatched, and all that kind of thing.

Then there must be provision for distribution, transportation, introduction and restoration—of what? Game birds. Are the forests of the country, on account of the restoration or the propagation of birds, to yield food to seventy-five millions of people in the same way that the waters of the country, as is claimed, equal acre for acre in food-producing capacity our agricultural lands? I guess not.

I do not know exactly what kind of birds this bill refers to. "Game birds and other wild birds useful to man." In reading some of Boccaccio's stories in the *Dameron*, I have thought at times that I should be very glad indeed if the sweet singing birds could be reproduced as they were many years ago—especially the nightingale. [Laughter.] But I do not know whether the nightingale is to be introduced here or not—or the hummingbird.

The truth of the matter is that the Congress of the United States has no power to legislate for the protection of birds in the various States. We have jurisdiction over navigable waters and therefore can legislate with reference to fishculture; but for the protection of birds we have no power to legislate. The various States attend to that matter. The State of Illinois has laws touching the protection of birds, so has Iowa.

Mr. Lacey: Does not the Fish Commission introduce fish into non-navigable streams?

Mr. Cannon: Certainly; it does it by permission. But the Fish Commission has no power to protect fish, in the spawning season or otherwise, in any of the non-navigable streams of the United States outside of the Territories and the District of Columbia. For such matters we depend on State legislation; the State police power can attend to that kind of work.

Now I believe this is a nation with a big N. I have always thought so; but after all said and done, there are some things we can trust to the States; and in the matter of protection of birds—the hummingbird, the nightingale, the mockingbird, etc.—as we have no power to preserve them, we had better leave them alone and trust their protection and propagation to the police power of the States.

Mr. Cox: When the gentleman speaks of the nation with a big N, what does he mean by that big N?

Mr. Cannon: I am speaking of the power of the Federal Government. Now as I look at this bill I see nothing in it but extravagance and mischief. Gentlemen say we can withhold appropriations. But when we once begin to build aviaries, with all the expenses attending them, we do not know where the matter will stop. We do not know whether they will be heated with steam heat or hot water or some other arrangement, which these scientific gentlemen may devise. When an aviary has been established in the district of one representative, other representatives will want aviaries established in their districts. Of course, it will be all right while we are here; but when we pass away we do not know what may be done by those who are to follow us. [Laughter.]

Is the object to be attained (I speak now seriously) worth the expense? It seems to me it is not; and we shall scarcely be very well able to hold this expenditure in check when we get a lot of scientific gentlemen—bird propagators—employed in this work throughout the length and breadth of the country. Each one has his friend or friends in the various districts.

Now, Mr. Speaker, I would just like to test the sense of the House touching this matter by entering a motion to indefinitely postpone the consideration of this bill and the Senate amendment.

The question was taken, and the Speaker announced that the noes had prevailed.

Mr. Cannon: The noes evidently have it; but I will take the sense of the House by a rising vote. I believe

that we have the most votes, but they made the most noise. [Laughter.]

The question was taken, and on a division there were ayes 39, noes 71.

So the motion to indefinitely postpone was rejected.

The Speaker: The question recurs on the motion to non-concur in the Senate amendment.

The motion was agreed to.

The Speaker: The question is now agreeing to the conference requested by the Senate.

The motion was agreed to.

The Speaker announced the appointment of Mr. Perkins, Mr. Payne, and Mr. Talbert as conferees on the part of the House.

Rocky Mountain Vignettes.

I.—The Story of a Head.

SITTING here in my study enjoying a post-prandial pipe and dreaming before the cozy wood fire, the strange shapes that come and go, the scenes that dawn and fade in its coals, give "that color that never was on sea or land" to my musings, and lend a witching aid to my imagination. Invoked by its witchery, and by a glimpse over my shoulder of a head hanging on the wall, I recall that day of days when, far from such scenes, high above timber line, in a land of lichens, where no tree will ever strike root, I gazed for the first time upon the stateliest wild animal that walks this western world, the antlered monarch of the mountains upon his native heath, with the scarped and snow-capped peaks rising around him, and the cold wind that comes across the snow fields, and bends the bunch grass in rustling gray-green undulations, knowing no taint save the strong, sweet smell of the elk.

The railroad and civilization were a week's journey by saddle and pack horse behind us, and since early dawn of this September day I had hunted with Jno. Holland, my guide, through forests of somber evergreen, along the steep hillsides, and among the high mountain meadows, park-like with their patches of pine and aspen. Late in the afternoon we came to a large snow field lying along the base of a porphyritic pinnacle that towered almost perpendicularly 100ft. above it. Even on the lower ranges, far below the region of perpetual snow, September will still find snow fields, varying from a few yards to many acres in extent, wherever they are sheltered by some overshadowing peak during a portion of the day. As the snow thaws slightly during the day, there is generally a narrow strip of mud along the lower margin of the field. To the elk this is a gala ground. If there is a bull anywhere in the vicinity he will write his autograph here, wallowing in the mud, and pawing and eating the snow, and the hunter approaches such a spot with the feelings of a ticket holder at a lottery. As the surface thaws during the day and freezes at night it is easy to tell when the tracks were made—if only the evening before frost needles will be found in the bottom of the solid bowls that held the spreading hoofs. We found an abundance of sign here so fresh that we determined to wait until evening and watch it in hope of the elk visiting it as they had for many evenings past. While waiting, we determined to climb the pinnacle, and leaving our guns clambered up the big blocks of porphyry on all fours at some risk and considerable expense of epidermis. But it was worth it. From the summit we gained one of the grandest views I ever enjoyed in the Rocky Mountains. The other side fell away a sheer wall without a projecting ledge for fully 1,000ft. Far down the chasm-cut mountain side a patch of aspens flaunted its red and yellow hues against a background of evergreens below. Lying at full length, with my eyes just clear of the brink, I ventured to raise the glasses—with irrational fear, I must confess, that the added weight might topple me down the dizzy descent—and scanned the rock-strewn prospect in vain for sight of sheep or goat.

"If there's anything in those aspens they're goin' to come out," said the mountaineer, who, with utter disregard for the laws of gravity, sat swinging his long legs over the precipice, and loosening a piece of porphyry he hurled it down.

A cloud of cut twigs, dirt and debris marked the path of the projectile through the thicket. It must have gone into it with the velocity of a cannon-shot. Rock after rock went hurtling down the mountain side, some, upon striking a projecting ledge, bursting into a thousand fragments, and disappearing in a cloud of dust. While the big mountaineer was engaged in this childish amusement I lay at length, basking in the warm sunshine, and enjoying an idleness sweetened by fatigue such as only the climber in that high, thin atmosphere knows.

Across the cañon towered a wall of basalt, whose dark breast was braided over with flashing streams. Afar off above the dim mountains of amethyst in the northwest lay an argosy of white clouds like some convoy of ships becalmed on a summer sea. Clouds? Did ever clouds gleam with such dazzling brilliancy? Did ever sky-piled vapors assume such rigorous distinctness of outline? It was the snowy summits of the three Teton, giants of the range. Below us, beyond the snow patches, along the sloping mountain side lay a tawny reach of bunch grass in bright relief against the dark green of the balsams, below which looked like a field of half-grown grain. Suddenly, upon the bare ridge just beyond the snow field arose an antlered head, whose many tines looked like the bare branches of a tree, and with his big ears set like the spinaker of a yacht, a bull elk with his stately stride came into view, followed by his harem in single file, with their heads hanging down like cows driven to pasture. So pastoral was the scene that for a full minute, in my condition of *dolce far niente*, I failed to grasp its import, but lay idly, dreamily, gazing upon the wild mountain kine as if they were but common cattle back in my bluegrass home. The next, with a swift revival of sense, I clutched John wildly, and too excited to speak, could only point toward the game. He paused with a rock poised in his uplifted hands, and glancing where I pointed, fell back as if struck with paralysis, his heels still hanging over the precipice.

"Lie still—don't move again," he whispered, "they haven't seen us—but we haint got our guns."

It was true; we had to abandon them to climb the pinnacle, and there was nothing for us to do but wait and pray for an opportunity to regain them.

The herd scattered out upon the snow, and fell to pawing and lapping it. The big bull skirted the field, thrusting his muzzle into the mud made by the melting snow, until at last he found a nice oozy, miry spot, which was evidently of extra flavor, when he very deliberately lay down and made several ineffectual efforts to roll over—a feat which his antlers prohibited. Failing, he lay for some time chewing the cut of sweet and bitter fancy in apparently the acme of bovine content, then rose, and shaking himself like a dog, was for a moment enveloped in a halo of mud and water. He stood for some time apparently pondering divers deep and weighty matters, then arching his back, he stretched out first one hindleg and then the other, and then selecting the cow which seemed most comfortable, he routed her out of her snowy couch with hoof and horn.

"The sonofagun!" ejaculated my companion, "if I only had my gun now."

Soon they all strayed off over the ridge. As the last head dropped down out of sight we started for our rifles, tumbling down the peak, and finally plumping into the snow with sublime indifference to danger. From the top of the ridge we expected to view the quarry, and after pausing near the top to breathe, we peered cautiously over with rifles at full cock. A stretch of bunch grass lay before us, the nearest timber a quarter of a mile away. Into this the herd had disappeared. Making for it we wound in and out of copses of stunted pine, riven and twisted by the winds that ceaselessly sweep these altitudes, keeping well up and to windward. Even when feeding, elk will sometimes go at a ground-covering gait, but we began to believe that the herd was traveling, and consequently growing solicitous, quickened our steps. Suddenly, out of the ground, hardly 40yds. away, suddenly and silently as an apparition, arose a young two-spike bull, whom the master bull had evidently run out of the herd, and who was hanging on its outskirts. I was just stepping out of a gully, but dropped back instantly into its friendly shelter.

"There he is," excitedly exclaimed John, poking his Winchester over my shoulder. I promptly grabbed the muzzle and jerked it down. "There he is! Don't you see him? Why don't you shoot?" and then catching a plainer view, muttered an obijuration upon his eyes and subsided into silence.

With lifted head and ears, eyes and nose striving for sight, scent, or sound, the animal stood for fully five minutes, and then deliberately lay down, either believing himself the victim of an optical delusion, or else attributing the disturbance to some innocuous habitant of the mountains.

Beating a retreat, we passed above him, but despite the warning we had received almost ran into a cow, who was feeding in a little swale, surrounded by bushes so nearly her own color that she escaped detection until she raised her head. We simultaneously saw the first movement, the trees were behind us, and standing as we stopped we remained rigid while her great ears pointed toward us. After a long look she dropped her head, but immediately lifted it again after snatching a mouthful of grass. Though not startled, she was suspicious, and quietly disappeared among the trees.

The herd was scattered and feeding, and for half an hour we crept around it before we located the master bull. At length we caught a fleeting glimpse as he strode across an open space, and occasionally afterward were enabled to keep him located by glimpses of his towering antlers, as he moved about in the copse. We crept down within 100yds. of him, and as there was no more cover, determined to walk boldly toward him. Posting John where he could see if the bull broke cover on the opposite side, I fared forth across the open, straight for the clump that hid the bull. I had taken but a dozen steps when I was halted by an apparition that arose above the brush—clearly outlined with ears pointing toward me, the clean-cut, blood-like looking head of a heifer. The next instant there was a frightened snort, and the heifer went crashing away through the woods. With ears and eyes straining, I strove to locate the bull. Has he too fled? If so, his hoofs were shod with silence.

Oh, the excitement of those few tumultuous moments. Suddenly the suspense was ended. Suddenly sounded the challenge of the bull, so close, so hoarse and harsh it sounded that I drew back appalled. More like the roar of some huge beast of prey was it than the mellow, flute-like notes that were wont to float down the mountain side on the frosty evening air, and die away down the echo-loving cañon in mellow fragmentary bugling. The next moment he broke cover, thrashing his huge antlers from side to side against the bushes as they parted, and gave egress to the biggest bull I had ever seen. His shaggy mane bristling with fury fell, and like lightning his whole demeanor changed as he burst into the presence of his deadly arch enemy, man, and with a whistling snort of fear the huge beast wheeled and plunged back into the engulfing bushes as I fired. So quickly had it all transpired, so suddenly and unexpectedly the whole denouement, the fearless charge and the hasty retreat, that my aim was naturally uncertain even at that short range, but through the smoke I saw the big fellow swerve as he plunged into the brush, and dashing after through a strip of pines, I got a snapshot as he plunged across an open space, and the next moment a bullet sang over my head uncomfortably close as John opened fire above me. I promptly dropped down and yelled to him not to shoot, and upon his replying I quickly got out of the bushes. Far below we could see the cows scurrying like mice along the mountain side, and disappearing in the heavy timber. Hastening to the spot where John had last seen the bull, we were gratified to find a few drops of blood beside his tracks, and a few paces further on some flecks of bloody froth upon the leaves of the aspens showed that he had been shot in the lungs, and as we carried the trail along the splotches grew more frequent. Then ensued a long and laborious trailing, as monotonous and irksome in the doing as it would be in the telling.

In the dusky twilight, while it was still darkly day, we were carrying it through a grove of balsams that clung to the mountain side. John was in advance with his rifle slung by its strap over his shoulder, and bent over to follow the faint hoof marks left on the flinty surface or the fainter splashes of blood on the brown pine needles growing more and more indistinct, and difficult of de-

tection. Stepping in his footsteps, with my rifle at full cock, I was gazing straight ahead, and in the darkening depths of that balsam grove I caught a movement, and gave the warning cry. Without looking up John sprang down the mountain side out of my way, clearing the field of action, and gaining a place of safety for himself, soft, at a jump. Simultaneously the thunder of hoofs sounded on the air, and the hunted animal, with the long hair on his neck and back erect, and curling forward, and with his eyes glaring green with the malevolence of a demon, the hunted animal charged his persecutors. There was no time to flee, there was no time to even think, there was mighty little time to act, but the old Winchester over there in the corner came up to the shoulder right and true, and the bullet made the hole that has been so carefully hidden by the taxidermist's art in the head on the wall.

FRANCIS J. HAGAN.

Game in Jackson's Hole.

LANCASTER, Pa.—*Editor Forest and Stream*: Referring to the communications from Mr. W. L. Simpson relative to the subject, permit me to say that Mr. A. C. Kepler and I returned a few weeks ago from a very enjoyable hunt in the Jackson's Hole country. We left Mr. S. N. Leek's Recreation Ranch in the Hole on Sept. 20, and returned with our outfit on Oct. 10, having been in the mountains twenty-one days. Mr. Simpson, your correspondent, was also out with a party, they having left the settlement about Sept. 1. They were camping in Fall River Basin, and he having occasion to go out for mail and additional supplies, returned via the "Horse Creek route," which necessitated his passing close by our camp, which was located at the foot of a cañon on one of the tributaries of Granite Creek, and some ten miles from his camp. As it was getting dark, we, sportsman like, insisted on his remaining with us over night, which invitation he was glad to accept. After filling him up with roast bear, luscious elk steak and coffee such as only Andy Mattison can make, we added more and larger dry fir logs to the fire, and proceeded to smoke the pipe of peace, happy in the fact that there was not a single red Indian in the Hole thus far this fall.

We had scarcely got started questioning our visitor as to the news of the outside busy world, when who should put in an appearance but Mr. D. C. Nowlin and his favorite dog, Mike. He was on a trap line, and was camping in the next cañon, but a few hundred yards above us. After the usual greeting, Mr. Nowlin and his faithful companion joined the circle, and as they did Mr. Simpson proceeded to inform our caller that his name had been placed on the Republican ticket as a candidate for the Legislature. Then the conversation turned to game protection, and the numerous evidences of violations of the law before the hunting season opened. The whole subject was discussed in all its phases, and I write to verify all that Mr. Simpson has said in all of his communications, and am only sorry he did not tell all he knew, about the way parties slip in through the Green River route, and commit wholesale depredations in this best of all game regions in the United States to-day. During our stay in the country we had ample opportunities of becoming very well acquainted with Mr. Nowlin, and with his neighbors rejoice that he has been elected a member of the Wyoming Legislature. He is the right man in the right place. He is a ranchman, hunter, trapper and surveyor, and being in possession of a good education, is a fluent speaker, and having had an extended experience on the frontier, he will be capable of voicing the best interests of his constituents on the subject of game protection in the Jackson Hole country, as well as other subjects of public interest.

There is but one Yellowstone National Park. As a park filled to overflowing with unique and marvelous evidences of internal fires, and a large area of thin earth crust, it is out of reach of competition, and will continue to supply subjects for the artist, the kodak fiend and the scientific student, so long as the geysers shall continue to spout, and the boiling water to deposit incrustations. As a game preserve, however, it is a signal failure, and reminds me of a key without a handle, an arrow without a bow, or a gun without a lock; and unless the Government shall conduct the preserve in accordance with the natural conditions existing, in a comparatively short time the game in the Park will consist of a few specimens of bears, coyotes, lynx, beaver, porcupines and foxes. All of the deer family will eventually go where the buffalo did. Then, when it is too late, regrets and "I told you so" will be in order.

It is estimated by those who have the best opportunity of knowing, that within the Park proper, and thirty miles south of the south boundary, in Uinta county, Wyoming, there are not less than 10,000 elk hanging around the base of the foothills at the present time. This section of country south of the Park is bounded on the north by the south Park line; on the west by the Gros Ventre, and on the east by the Teton ranges of mountains; and in places the main ranges approach each other so closely that the foothills come almost together. The average altitude of the main ranges is not less than 9,000ft., while the elevation of the Snake River, which winds its serpentine course through this magnificent country, is only about 6,000ft. The foothills have a maximum average altitude of about 7,000 to 7,500ft.; they are well supplied with water, well wooded, and interspersed here and there with grassy parks and numerous natural licks, as well as deep, dark cañons. In this ideal natural game region between the base of the foothills of the two main ranges, there are hundreds of thousands of acres of fertile plains, including the Jackson's Lake region, Fall River basin and the Jackson's Hole country. Ten years ago this grand game country was visited only by Indians from the reservations, prospectors, hunters and trappers, and but comparatively few of them. Then, when the winter snows were from 15in. to 2ft. deep in the Yellowstone Park and the foothills of the main ranges, the elk migrated to the lower altitudes, where the snow would be oftentimes not over from 4 to 10in. deep, and where they could subsist fairly well by pawing down to the luxurious grass, or if the snow was crusted they could still do fairly well along the banks of the rivers, their tributaries and the lakes.

But, alas for the noble elk family, conditions have changed. Eight or ten years ago the prospectors, hunters, trappers and skin-hunting Indians destroyed yearly a goodly number of elk; nevertheless, the survivors were

not prevented from coming down from the higher altitudes and ranging in the parks, where they could get through the winter fairly well, and come out in the spring in fairly good condition.

Now much of the most fertile and desirable park land is being taken up by ranchers, and when the deer look down from the foothills into their favorite winter ranges what meets their gaze? Smoke curling from the sod-covered cabins, corrals, hay ricks, with high fences surrounding them, and herds of cattle and horses. Is it any wonder that hundreds starve every winter, and in the spring months hundreds more die of scab, caused by insufficient food during the winter? The remedy is plain. Let the Government adopt the suggestions offered by the Jackson's Hole Gun Club and take this whole section under the fostering care of the Yellowstone Park Commission. Properly protect it on the north east and west, and from what I have observed during my stay in the country, I have no hesitancy in guaranteeing that the community known as the Jackson Hole settlement will look well to their end of the line, as they have no use for dude sportsmen, who usually shoot at anything moving, poachers, or red or white Indians. S. T. DAVIS.

A Week in Delaware County.

EARLY in October, when the foliage was at its best, and the days clear and cloudless, with just a little snap, I began to grow more and more restless, and soon realized that a few days afield was the one thing essential. A trip to the mountains which surrounded the upper Delaware seemed the most attractive, and failing on companions, with such short notice, I decided to play the "lone hunter." My pointer dog Don had not as yet arrived from North Carolina, where he had been for some time with a friend, but I knew of another dog, at my destination, which I could have for a few days, and the rest of the time would not go amiss with the squirrels.

Early the following Saturday found me aboard the cars and dressed for business. It was raining hard, but I had the best of hopes for a pleasant afternoon.

I arrived at the farmhouse in time for dinner and received a hearty welcome. During dinner the clouds broke away and a fine afternoon followed, the trees glistening in the sunlight, and never was air any purer.

Putting the gun together and slipping a few shells in my pocket, I started up the quarry road, which was very steep and led to very nearly the top of the mountain. It was now 3 P. M., and a fine time for squirrels after the rain.

As soon as I reached some large chestnut trees, with a sprinkling of pines, I stopped and stood enjoying the surrounding beauties. The rush of a released branch back to its natural position, a shower of rain drops, and I was at once on the alert for squirrels. I soon spied him jumping from one treetop to another; a sharp report; swish! swish, down he came, from branch to branch, and with a dull thud reached the ground. He had been feeding on chestnuts, as I had supposed, which were unusually thick this year, and of course was as fat as butter. After placing him in my pocket, I remained perfectly still and repeated the same performance in a tree on my left. A third squirrel could restrain his curiosity no longer, and he too was added to the bag. It was just dusk, and as my previous trips to this locality had been in quest of fish, and therefore spent in the river, my knowledge of the mountains was limited, so I hurried down toward home. I lost my way several times, but got in after it was pitch dark. My friends fearing I was lost had just about made up their minds to look for me.

My host was a genial old gentleman, known to his little nephew, who lived at the house, as Uncle Jackson. In the evening he was very anxious to play with me at his favorite game. He had the reputation of being the champion of the neighborhood. They called the game pitching rings. Each of us took two rings about a foot in diameter, and threw them at a stake at the other end of the large room, the rest of the household constituting the audience. We kept pretty even, and finally the score was tied. It was my turn, if I could only make a ringer, which counted three, and go out. I took careful aim, and over the stake it went.

The old man was next, and proved thoroughly equal to the occasion. If he could only put one over mine it would cancel it and only his would count. He toed the line and slowly remarked: "Uncle Jackson's going to do his best, by jolly!" With a slow swing of his long arm, a jerk upward with his head as the ring rose in the air, and the same head motion reversed when it descended, he "did his best" and landed a ringer, winning the game and retaining his championship honors, amid the deafening applause. "Uncle Jackson said he was a-going to do his best and he did it," was all he said between his chuckles.

The next day, Sunday, I spent quietly enjoying the perfect weather and my favorite pipe.

Early Monday morning I arrived once more on the mountain top, after almost an hour's tramp, and was soon seated on a log—a la "Nessmuk"—awaiting results and using my eyes and ears to their best advantage.

A couple of squirrels were bagged, and I started down the mountain for dinner. When about half-way down out went a partridge like a cannon ball, and letting him have my right, he "bit the dust" in Indian style. The report started an unusually fine gray, which skipped along a log for the nearest tree. Of course that called for the other barrel, and I was well pleased with the double shot. As I was out for a week, I considered I had reached the limit on squirrels for one day, so spent the afternoon exploring new grounds for birds, but without adding anything to my bunch hanging in the cellar.

The next morning, while noiselessly creeping through the woods, I heard the unmistakable hoarse chatter of grays, and looking ahead saw three frisking around on the ground feeding. In their midst was a partridge, which immediately got up, fanning the leaves in every direction with its wings.

The squirrels thereupon kindly disappeared, and although I held down the usual log for some time, only one which had been hiding in the top of a pine put in an appearance. After sneaking down the opposite side of the tree, he succeeded in getting quite a distance before being discovered, and eventually escaped. I took lunch in the woods this day, and bagged the usual number of squirrels before returning at sunset. During the afternoon an old partridge with even more than the usual cunning led me a

long chase. I succeeded in finding him by still-hunting several times, but he always took care to keep plenty of trees in the way, so I concluded he was a little beyond my skill, handicapped as I was by absence of dog or companion.

That evening I stumped it to the village to join the circle around the grocery store stove, pick up any information about the country, and also to see the owner of the pointer. After listening to the bear and wildcat stories, I saw my man, and he agreed to be on hand in the morning with the dog. Soon after breakfast Enness appeared with his dog and wanted to visit the mountain top first, where I had seen a few birds the day before. We hunted this locality without success, and crossed the mountain, descending the other side toward the river. My companion winked slyly and said: "Let's go down to the river and hunt through the swales; a friend of mine who owns the other half of this dog told me he had seen a couple of woodcock in one of them, and was going to look for them next week, but I guess it will be after us." We soon reached the edge of the stream, where there was a large willow swale, so Enness plunged in with the dog while I walked along in the opening on the outside.

The next instant Sport came to a point, and presently a partridge burst out on my side, offering a fine shot as he started up river straightaway. We sometimes make the worst misses on the easiest shots, and I scored a bad one, the bird pitching in the swale again further up. The sport continued all the morning with fair success, the man on the outside always getting the shot, the brush being too thick inside to see very far ahead of the dog.

At lunch time we sat on a log in the sun and brought out the chicken sandwiches and cake. Sport had to be contented with the bones, which he hurriedly swallowed and then sat patiently looking at first one of us and then the other. "You'll eat to-night, old boy," remarked his master, and the old dog licked his chops and was just as ready to renew the hunt as we were.

We had eaten our lunch on an island, a long strip of land which divided the stream for a short distance, and was submerged, in the spring, during high water. One end was covered thickly with young willows about roft, high, the middle was a mass of driftwood, turned silver-gray by long exposure to the weather, and the other parts of the island were partially clear with a few tall trees and occasional bunches of weeds.

Just before lunch we had put up one of the woodcock we were looking for, and after both scoring a couple of misses he had apparently disappeared. While looking for him, I accidentally stumbled into a couple of partridges, the dog being some distance away. Choosing the largest, I swung around and doubled him up in mid-air; one of the cleanest kills I ever made; he never stirred after hitting the ground.

Hunt as we might, that woodcock was not to be found, although we had marked him down carefully near the driftwood. We at last came to the conclusion that he was hiding in this, and had eaten our lunch while waiting for him to come out. In about ten minutes after the search had been renewed, the dog came to a point and hardly 3 ft. from his nose was the old cock. Sport trembled with excitement at his close point, but remained steady. My companion was close behind him, and fired point blank before the bird had hardly had time to rise roft. The result was that it took two of us to pick it up and fit the three parts together, after taking out the wad from its breast. "Well," said Enness, "I could not see him escape again; I now feel satisfied at any rate." As far as I was concerned, well, I had not intended to have that bird dressed for stewing.

The sun was well down, so we parted for the night. As Sport was not as young as he used to be, and as this was his first hunt this season, he was too lame to be of any use for the rest of the week, during which time I hunted squirrels. Toward the latter part of the week I suddenly ran across a large black one, feeding and moving slowly along the ground. Just then he saw me, and I immediately drew a bead on him. After the report I stood motionless for a few minutes, my eyes glued on the spot where he had been. Presently I walked over there and stirred the leaves all around, but no squirrel. Another mysterious disappearance. "Well, Mr. Squirrel," I said, "if you don't mind, I'll take a seat and we'll see who can keep still the longest." He did pretty well, for it was twenty minutes before I heard a branch shake, and directly behind me at that, in exactly the opposite direction. I call that pretty good sneaking. When I fired he had evidently run toward me up the log I afterward sat on. This was a fallen tree, slanting well upward, and pointing directly from him toward me. How he did this and kept out of sight I do not know, and only lay it to squirrel sense. Turning quickly I let him have the right, but he did not stop, so had to use the left to finish him, as he seemed much harder to kill than the grays. To me he was a rare prize, and I now had eleven squirrels and several partridges, besides the unhappy woodcock. Altogether they made a pretty bunch.

Bidding my friends good-by and resolving to try it again next year, and with my own dog, I caught the evening milk, and getting off a few stations down the road boarded the New York Limited from Chicago, which did not stop at our town. On the train I met a congenial spirit, and as the old man expressed it, was as "proud as proud could be" when I reached home with my trophies.

HORTZ.

NEW YORK.

Dogs for Detecting Boxes of Illegal Game.

NEW YORK, Jan. 11.—*Editor Forest and Stream:* It ought to be a simple matter to train dogs for finding illegal game in disguised packages. If I were a game warden my first steps would be to get a setter pup. Then some game would be packed in a box and the box placed in a row with other packages. The pup would be brought into the room, and when he stopped to smell of the game box he would be given a piece of meat, and the contents of the box would be shown to him. This repeated a very few times would train him on game. The next step would be to rule out boxes of domestic fowls. In order to do this, I would pack fowls in a box, and if the dog paid them any attention he would be reprimanded a little, and the reward refused him. Any smart setter or pointer pup should enter into the sport with enterprise and enthusiasm.

ROBT. T. MORRIS.

The Cuvier's Annual.

THE annual meeting of the Cuvier Club, of Cincinnati, was held on Jan. 7, with a large attendance, to hear reports and elect the officers for the year. The event of the evening was the presentation of a beautiful gold watch to President Alex. Starbuck. Then followed Mr. Starbuck's re-election to a new term of the presidency, and Judge Peter Swing made the neat presentation address, in which he paid merited tribute to the rare qualities which have distinguished the Cuvier's executive during the year. He said:

"Mr. Starbuck—It is my pleasure on this occasion to say something to you in behalf of the members of the Cuvier Club. We all look upon your devotion to this club as being remarkable. It seems to us that almost every thought that you have is for it. You have brought to bear in the position you hold a fidelity and ability that challenge our admiration, and with it you have brought a personal charm of an elegant gentleman, firm and manly in every act, and yet pleasant and considerate to every one, and we all look upon you as a manly man. As a slight token of our regard for you, as our president and as a man, we ask you to accept from us this present, and with it take this wish, that as it measures of the coming time with its tick, tick, tick, each moment may bring to you increasing happiness and success until the end, and may no naughty bad man ever take this one away from you."

The officers elected were: President, Alex. Starbuck; First Vice-President, Jas. M. Daugherty; Second Vice-President, Henry Hanna; Third Vice-President, P. E. Roach; Trustees, P. E. Roach, Henry Hanna and Alex. Starbuck, elected for three years.

The annual report of President Starbuck discussed bird protection, forestry, fishculture and the other public interests with which the Cuvier Club is concerned.

President Starbuck's Report.

After reviewing the situation as to song and insectivorous birds, President Starbuck continued:

As an exception, however, to this we are pleased to state that the past season our toothsome game bird, Sir Robert White, or to put it without the royal insignia, Bob White, has, owing to the moderate winter of 1896 and 1897, largely multiplied, and as a consequence the Nimrods, the past season, secured fair bags of them. They were found in reasonable numbers in the stubble fields, by sheltering hedge and thorny glade, and where the buckwheat was reaped or where the oats in swaths were laid. We are fearful, however, that the recent cold weather, which not only visited us unusually early, but came with such an icy breath that it has doubtless slain more of the birds than the breechloaders of the sportsmen. The earth once a mantle of frozen snow, starvation inevitably is the result. Ducks, snipe and field birds in general are reported on the rapid decrease, and when we read that 28,000 birds, illegally shipped, were seized last year in Chicago alone, the cause of this depletion is plainly manifest.

Pot-Hunting Sportsmen.

Again, the insatiable greed of some pot-hunters who fraudulently pose as sportsmen kills many thousands of the delicious birds for refrigeration and solely to use after the open season has closed. This but adds to the decrease, and notably so. This is not alone true of the birds, but it is also true of almost every living thing that builds or swims or burrows in our woods or streams or fields. The spirit of wanton destruction that has exterminated the buffalo is at work in every State and county in America. Fish are caught out of season, nets are used when rod and line alone should be permitted, trapping goes on regardless of the times for mating and the rearing of young birds and animals. This will doubtless continue till the fowl with the golden egg is finally killed, if this wicked warfare is not very soon checked.

We regret that a number of our city magistrates for a long period of the time have dealt so leniently with the violators of the game laws, and as a consequence drive the wardens to the suburban 'squires, who are not so much in sympathy, nor so politically interested with the offending parties. The public understanding of all this would fully allay the bitter feeling that is so often engendered against the efficient warden. His salary comes alone from the assessed fines, and when they are remitted or made merely nominal, he seeks justice where it is dealt out with a more impartial hand.

Unfortunately for us, the prosecution of the violations of the game laws in this county, in the early part of the season, was quite feeble indeed, a sort of opera bouffe performance, and all owing to an inefficient warden. He, however, knew where to find the pay-roll. A change of officials, we are pleased to state, worked much better, but still there is much to do in perfecting a thorough system in policing the county, to make it a terror to all who defy the game laws. The force of this county should at least consist of twenty deputies, located at advantageous points, so that no part of the district should remain uncovered by them, and each should be in close touch with the adjoining deputy. As the chief deputy of this county can appoint as many as he desires for the work, the system of surveillance can easily be accomplished, and should be put in force without further procrastination.

Consider once that 75 per cent. of the game birds of this country have been destroyed during the past fifteen years and you will then fully realize that it is high time to dispel your sympathy for these violators, who are so rapidly decimating our edible birds by illegal traffic during the close season, and otherwise. We are gratified to learn that the Game and Fish Commissioners have planted, the past year, a large number of black bass, marble catfish and other edible fish in the different streams throughout the State, and report that this year they will be better prepared for both propagation and planting. What they most stand in need of is a larger appropriation at the next session of the Legislature, so as to enable them to accomplish double the amount of work in fish and game protection, propagation, etc. If our representatives and senators wish to see our game, fish and insectivorous birds protected and a large increase in our food fishes, as well as a generous distribution of the Mongolian pheasant, the coming bird of America, they should vote for a generous

appropriation. The entire public will, in the future, assuredly reap rich rewards from it.

Quail on Steamships.

You now naturally inquire how are we to protect our fish and game? Again you ask where and what is the greatest destroyer of them? I emphatically state, in regard to the last question, that it is found in the cold storage houses that exist throughout the length and breadth of this fair land. Last fall a gentleman informed me that in crossing the ocean en route to Continental Europe, as late as July he saw quail publicly served on the steamer at nearly every meal. Arriving in Europe, he found them at one of the gilt-edge cafés; going to Egypt, he was again confronted with them, and these were paraded as American quail. Cold storage solved it all. At a meeting of fish commissioners of various States, held in Chicago in February, 1898, one of the commissioners, Mr. Bortree, cited the Kenena case, where 27,000 head of game was uncovered (and covered up again) in a freezer. Mr. Werner, the steward of a large restaurant in Chicago, said at the same meeting: "I can show you a thousand saddles of venison in cold storage here to-day." I know how that goes, for I have bought game enough in my time. I have had quail offered to me at 65 cents a dozen, and prairie chickens at \$1 a dozen. The market was glutted at times, and the game deteriorated in the course of years; in fact, it was not fit to eat after it had been so long in storage.

A St. Louis game dealer employs sixty hunters sixty days before the season opens, and about the same time after its close. This has been published throughout the country and still the same firm continues its illegal traffic with as much boldness as if it were legal.

I might fill pages with examples of the same kind, but the above is enough to convince, I hope, that the cold storage houses are knocking our game out at the rate of 4 or 5 per cent. a year, and is one of the most conclusive methods of assisting in its utter extermination. I might ask in the language of the American humorist, "Where are we at?" and what are we going to do about it? Some say educate the people up to an observance of the law. Educate them, if you can, but the best educator is prompt and severe prosecution, and that is what we are organized, in part, for. You want no lace-like language for this subject—plain, stubborn facts are better.

Legislative Bungles.

Our legislators evidently are not brilliant, sound nor subtle lawmakers when it comes to preparing statutes for the protection of fish and game. At every session they bungle, and all from the fact that they are not painstaking in their work. The statutes of Ohio have many old laws in this respect that should be repealed, for they conflict with the present laws, and in many instances render them null and void.

The law which made an open season the entire year for the destruction of the rabbit is also in aid of the pot and market-hunters, who, under the pretense of hunting the cottontails, more often destroy an entire covey of quail as it lies under some faded grass or in some weedy tussock. The law operates to the destruction of both. That, we presume, is manifest destiny, for civilization will eventually destroy all game within a consistent radius.

Non-Residents.

After due consideration I am satisfied that there should emphatically be, and without delay, a non-resident license for the protection of our game. The non-resident pays nothing for the support and protection of our game, whereas the resident is taxed for the machinery of the Government, both State and local. The State is now spending thousands for the propagation of the Mongolian pheasant, and once they are fully established in our fields and forests, is it not an imposition for non-residents to swarm over our borders, and slaughter these toothsome and beautiful birds without so much as saying "By your permission?" As an evidence of the importance of protecting this coming game bird of America, which is given a close season by the State till 1903, I will simply state that the Fish and Game Commission of Ohio has, the past year, judiciously distributed 2,000 of them, and in addition about 6,000 of their eggs. The results from this have been ascertained to have been quite encouraging.

There is also another law greatly needed, and that is one that will limit the killing of game and fish. This should clearly define the number to be taken each day, and if it is made effective it would very materially aid in cutting down the scores of the game and fish hogs. Realize if you can the indiscriminate slaughter that is made by those who seek game for count alone, and who, to be in unison, overlook the smiles of nature and the charms of art. Our hotels and restaurants are in the same category, for they in general but add to the aggravation by serving the forbidden birds on every advantageous opportunity. They should, when found guilty, be made to feel the extreme penalty of the law.

Uniform Law.

It is also to be hoped that a uniform game law may at an early date be made conjointly with Kentucky, Tennessee, Indiana, Illinois and West Virginia. As early as 1876 this club was operating on the same basis, but nothing has yet materialized from it. It is really like solving the riddle of the Sphinx to secure the co-operation of the Legislatures of the States mentioned. We will not, however, expand on this, as we reported largely in regard to it in our last annual paper.

My esteemed Cuviers, we must be up and bravely doing the work that is mapped out for us with indomitable energy. You have all earnestly toiled in this respect in the past, but let us put on stronger harness, and in the future do still greater work. It was glory once to be a Roman; now make it glory to be a Cuvier, and earn the laurel wreath or golden crown.

The game warden of Hamilton county, W. C. Rippey, reported: I have been very careful in prosecuting cases to make sure of the conviction before bringing suit. In the several cases we have had we have secured a prompt conviction. In the case of Besuden vs. the State, for shooting a quail out of season, he was fined \$25 and costs. In the case of Jokers vs. the State, for having quail in his possession out of season, he was fined \$25 and costs. In

the case of Rau vs. the State, for the same offense, he was fined \$25 and costs. In the case of Martin vs. the State, for the same offense, he was fined the costs, amounting to \$50. There have been three convictions for shooting on lands without permission; in each case they were fined the sum of \$5 and costs. We have now pending a suit for Sunday shooting which has not as yet been decided.

With reference to dynamiting and seining of the Little and Big Miamis, we have parties on both streams, who reside there, who are prepared to watch the rivers at the opening of the spring season. When the illegal work is being done we will no doubt have information at once, and I will act on the same immediately. The deputies appointed from different parts of the county are thoroughly reliable men, and will, I think, acquit themselves creditably. I believe it to be harder at the present time to buy quail of the local dealers than at any time for years.

In connection with this we will state that the fines under Game Warden Dr. Haywood, during the early part of 1898, amounted to \$200. I would also add that if any member of the Cuvier Club attended the Peabody banquet at the Grand Hotel at which quail were served under a different head, partridge, I believe, and will only testify to the same, we could bag one of the biggest violators of the game laws in the city.

The treasurer's report showed receipts of \$4,135.07 and expenditures of \$3,154.82, leaving a balance of \$980.25.

Maine Game Interests.

[From the Commissioners' Report.]

Caribou.

THERE are but few caribou in Maine compared with a few years ago. It is not long since they were more plentiful than deer, but they have apparently steadily decreased. Various reasons and suggestions are given to account for it, such as the decrease of their natural food, the moss, the depleting of the forests by the extensive lumbering operations, their alleged tendency to migrate, and kindred ideas. There are considerable numbers of caribou yet remaining in some sections of Aroostook county, and possibly in one or two other counties. The probability of the early extinction of the caribou should occasion great concern. There seems to be no reasonable doubt that their numbers could not stand the constant drain from year to year occasioned by the persistency with which they were hunted in open season, and the nefarious operations of the common poacher, pot-hunter, hide and market hunter. This is the cause of their disappearance. There is abundance of their natural food, the forests and barrens, their natural home, are almost unlimited, they have not migrated except before the muzzle of a Winchester rifle. If asked for a remedy, the obvious reply is protection. If caribou could be let alone for a term of years doubtless their numbers would rapidly increase. The law can do something, its enforcement much more, but game laws cannot be enforced without the means to employ a suitable number of suitable men to enforce it. The greatest depredations are along the Canadian border. The outlaw seeks an abode on the Canadian side of the divisional line, and has every opportunity to slay and kill without any one to "molest or make him afraid." Safe in his Canadian retreat he goes forth in summer and in the deep snows in winter and butchers the caribou to his heart's content on the American side, and is back again with his bundle of hides before any of the authorities know anything about it. An English gentleman of candor and intelligence informed us that caribou and moose meat was openly and publicly peddled on the streets of a Canadian town adjoining Maine during the entire summer of 1898, and at one time in the winter of 1897-98 fifty caribou were hanging up in the woods, killed in the deep snows on the American side.

Moose.

That moose are more scattered, that is, found over a larger area of the State than in recent years, seems to be an established fact.

All familiar with the proceedings of the Legislature of 1897 will remember that at that time there was a strong feeling that we should have an absolute close time for five years on moose, or else there was great danger of having this, almost the last of the larger game animals of the United States, becoming extinct.

The Legislature did not see fit to make an absolute close time for five years, but restricted the hunting season to six weeks, instead of three months, as before, and also made the penalty for violation of the law very severe. We are inclined to think the danger point is passed in consequence of this change, provided, always, that the destruction can be confined to legal hunting during the open season, from Oct. 15 to Dec. 1.

The number of moose in the United States is not large, for the region they inhabit is comparatively very small, yet they were once numerous over a territory more than twenty times larger than where found to-day.

Within the borders of our own State probably stand more moose than can be found in all North America outside of Maine, in regions accessible to sportsmen and hunters, and it largely rests with this and the coming sessions of the Maine Legislature to say whether or not this "monarch of the forest" of our generation shall become extinct.

While sentiment may figure somewhat in influencing the minds of some people in considering this subject, still if sentiment is disregarded entirely, and only the actual commercial value of the animal is taken into consideration, even then it seems to us a wise policy for our State to carefully guard and protect them against either extermination or decrease in numbers.

It is estimated by conservative judges interested in the preservation of our game interests, that the average worth of each male moose that inhabits our forests is at least \$500. We fully agree with them that this estimate is not too large, because we know from actual inquiry and observation that it costs more than that sum, on an average, for the sportsman from abroad to secure his moose trophy.

As there were killed in this State in 1897, 250 of which we have record, it will be seen that the money left in consequence, if our calculations are correct, was \$125,000.

These seem like large figures, we are aware, but realizing that the possible chance of getting a moose induces many other sportsmen to come and hunt deer, we feel sure that could exact figures be obtained they would be larger rather than smaller than those given.

The number killed this season promises to be approximately as large or perhaps even larger than in 1897, which naturally raises the question in the minds of those interested whether the supply will stand this constant drain, for the number who hunt them will never be less so long as they exist in any considerable numbers.

A great deal of the best breeding and feeding grounds are along the Canadian border, hundreds of miles in extent, and candor compels us to say that the evidence seems to show conclusively that poachers from the Canadian side make it a business to kill moose on the American side and openly peddle the meat in the Canadian markets.

To remedy this state of affairs would require the services of four additional trained wardens, at least, to patrol this section constantly.

From the most reliable information we have gathered from all sources—registered guides, wardens, hunters and others who have exceptional facilities for forming the best judgment upon this question, as well as somewhat extensive personal observation—we are of the opinion that the future supply will not warrant any additional open time on moose, or greater facilities for their capture.

Deer.

If we give due credence to all reports received from every quarter, registered guides, sportsmen, newspaper correspondents, farmers, transportation companies, wardens and others, deer have been increasingly abundant during the year. The exceptionally deep snows of last winter caused some anxiety, but we were unable to learn that deer suffered thereby.

The opportunities and temptation to kill deer illegally have greatly increased in the last few years. They are now found in every county and nearly every town in the State. There were at least 10,000 killed in 1897 legally, and the number legally killed this year cannot be less than 11,000. The number illegally killed is largely a matter of speculation or guess work.

At first glance it would seem that it would be impossible to supply the demand from the natural increase, if they are to be yearly taken in such large numbers. We are, however, convinced that there will be plenty of deer for an indefinite period, provided the present close time is maintained and legal killing only is indulged in.

Damage to Farmers' Crops by Deer.

We have received a number of complaints from farmers in various parts of the State that deer were destroying, or had destroyed, their growing crops, in some instances accompanied by a bill of the amount of damage claimed, and also a demand more or less emphatic that "the Commissioners take care of the State's cattle and prevent them from destroying their growing crops."

We have endeavored to carefully investigate every such complaint, and are convinced that the damage done to growing crops by deer is greatly overestimated, and is largely imaginary.

Still there are a few well authenticated cases where substantial damage has been done, and we think in all such cases means should be provided whereby full compensation may be received by the injured party.

Ways and Means.

The feeling seems to be increasing that the State, aside from individuals, should derive substantial revenue from its fish and game, in order to relieve in a measure our citizens of a portion of the burdens of taxation now required for the propagation of fish and the protection of game; whether the revenue derived from the license fees of guides, taxidermists and others, fines collected and other sources of revenue, shall all be expended each year for this purpose, in addition to the regular appropriation, or form the nucleus of a permanent fund, only the interest of which shall be expended, is a matter that the Legislature must determine. There is not much doubt, however, that if during August and September deer are allowed to be taken for food purposes only, by the person taking them in certain portions of the State, on payment of a fee of \$6 for non-residents and \$4 for residents, under such rules and regulations as the Commissioners may establish from time to time, and allowing shipment of fish and game, under such rules and regulations, when not accompanying it, on payment of a suitable fee, that a large permanent fund would accumulate in a few years, the interest alone of which would yield a substantial revenue.

In this connection it may not be amiss to call attention to what appears to be a feeling more or less strong among the taxpayers of the State, that some system should be devised for the taxing of visiting sportsmen by requiring a license fee from them, and the system in vogue in some of the States, and New Brunswick and other countries or provinces, is the most frequently advocated for the purpose of raising such revenue.

With a perfected guide law—with a law allowing the transportation of fish and game unaccompanied by the owner, under proper restrictions, on payment of a fee to the State, and allowing the taking of one deer for food purposes only, in certain portions of the State, during August and September, on payment of a fee for each deer so taken, with all proper restrictions so this privilege could not be abused, and possibly compelling the non-residents to hire registered guides, we are convinced that no good reason would exist for taxing non-residents for the privilege of fishing or hunting within our borders.

Guides.

The law enacted by the Legislature of 1897 requiring those "who engage in the business of guiding, either for forest hunting, or inland fishing, or both, to cause their name, age and residence to be recorded by the Commissioners, and procure a certificate, setting forth that he is deemed suitable to act as a guide," has been severely and by many unjustly criticised. Before the law was given any chance to prove its usefulness or otherwise, it was assailed, and the supposed authors of it, with the

greatest vehemence by those who for one reason or another were interested in keeping it off the statute book.

The Commissioners were of the opinion that this law would operate favorably for the better protection of fish and game, and from facts gleaned from the annual report of registered guides, which could be procured in no other way, much valuable information could be placed before the people. We believe that this law has proved, and will continue to prove, of great benefit to the State. Since its enactment 1,763 different men and three women have been granted certificates of registration, in accordance with its requirements, 1,443 in the year 1898 and 1,316 in the year 1897.

From the nature of their occupation during at least a portion of the year, it will be readily seen that they are all directly interested in fish and game protection, and so situated as to be able to help greatly the Commissioners in this important work, if so disposed, while if disposed otherwise they can do great mischief.

We think that every person authorized by the State to act as a guide for others, to take the State's property, its fish and game, should be compelled to observe carefully all the laws and render the Commissioners and wardens all the service in their power, by information or otherwise; in fact, should be fish and game protectors, and no person should be permitted to be a guide who will not do this. It can readily be seen that with this large number of persons directly interested in aiding in the enforcement of the fish and game laws, a much better system of wardenship would be carried on; in fact, those who are most conversant with the question of game protection in Maine thoroughly believe that without a system of laws requiring the registration of guides, and prescribing certain duties for them to perform to the State, it will be practically impossible to do very much to protect game, more than the enactment of restrictive laws; it has been said on the part of timber land owners of the State, that all non-residents who come to Maine to hunt or camp in the forests should be compelled to hire registered guides to accompany them during their trips through the woods.

The guides, of course, as a rule, favor such a law. But a criticism of selfish interest might attach to this position on the part of the guides. In case of the timber land owner selfishness cannot be alleged. The lumbermen argue the importance of their interests and the necessity of protecting them. It has been shown beyond question that too often parties of outside sportsmen who visit Maine and go into the forests without guides are either ignorant or careless regarding the laws regulating the setting of fires in the woods. The State can most effectively protect not only its game, but the forests of the State, through the "guide registration law." The guides understand, or can be made to understand, the proper places and ways of building camp fires, and can be made to realize the importance of having these fires extinguished before leaving the camping ground, and no other class of persons can, other than those directly interested. With experienced woodsmen for guides for all sporting parties, the wild land owners would feel that they had a reasonable guarantee of safety against forest fires.

Much has been stated in the press in relation to carelessness with firearms and the consequent loss of human life. That such occurrences are possible in these days at first might seem almost incredible. But that they do happen ought to impress upon men who go hunting or shooting the fact that firearms are dangerous alike to those who carry them and to those within their range. Even sportsmen who are not accustomed to the use of firearms need not fear these accidents, if they employ skilled guides and follow their instructions concerning the carrying and use of their firearms. In connection with this subject it may be remarked that it has been seriously considered whether it be not better to restrict the use of powder used in hunting big game to black powder, forbidding the use of the smokeless variety, and in the more thickly settled countries to allow in hunting large game only the use of shotguns.

In summing up the benefits to be derived from the guides' registration law, which has now been so much discussed that it is not only thoroughly understood by Maine people, but by those of other States who are interested in the preservation of the large game, it must not be forgotten that other States are beginning to see the wisdom of this law, and talk of adopting it, as in Colorado, where the Commissioner has thoroughly investigated the Maine law, and gives it his emphatic approval.

The advantage to be received by timber land owners throughout the State, by the extra precautions which registered guides will take against fires, is the first great benefit to be derived from this law. And equal in importance is the comparative safety which a hunting party will derive from the small chances of accidents or of being lost in the wilderness.

Then comes the benefit to be derived by the State in having these personally interested wardens to supplement the efforts made by the State to preserve and protect the game which annually brings so large an income into the State, besides furnishing employment to hundreds of men in a legitimate business of guiding sportsmen.

That this law is wise and just almost everyone at this time admits. That it is constitutional no one doubts at the present time, the highest court in the country, in an opinion written by Chief Justice Fuller, of the United States Supreme Court, having decided that the game of a State is the property of that State, and any restrictions which the supreme authority may determine may be placed upon the taking of it.

No man or party should be allowed to traverse or camp in the game preserves of the State with firearms in close time without a registered guide. The use of Winchester rifles for fish poles—rods—has become altogether too common. Hundreds of parties are found camping in the forests of Maine every year in July, August and September, and in nearly every instance have rifles and kill deer; nor is it possible to prevent it. No warden system we have ever had, or can hope to have under present conditions, can reach and prevent this state of affairs. The guides can stop it, and it is argued with great plausibility that if it was lawful to take deer during these months for food purposes only, under such rules and regulations as the Commissioners should from time to time establish, that the guides would be relieved of being parties acces-

sory to the illegal killing, and would see to it that the law was obeyed, and that no more deer would be killed during these months than are now, and the State would derive many thousands of dollars income for deer thus taken.

We are pleased to report that so far as summer killing of moose is concerned, the guides are almost all of them against it, and are willing to join with us to prevent it as far as possible.

It is otherwise with the summer killing of deer for food purposes, and also of moose during the two weeks preceding open season; many guides seem willing to assist their employers in this illegal killing. This is a lamentable fact, causing us a great deal of trouble and expense.

It seems to us that the guide who does this, after the State has done and is doing so much to furnish him with employment, deserves the strongest condemnation, and should be made to suffer a severe penalty in consequence. We favor the granting all the open season for game that can be done with safety, but when open time is once fixed, of compelling the guides to conform with the law strictly and absolutely, or quit the business. It is largely in their power to either improve or injure the hunting business, and assist very materially in causing a less demand on the State treasury in order to prevent poaching. In our opinion those who are willing to cheerfully assist on these lines should be allowed to continue the business, but those who are not should be barred from guiding.

By adopting this course, providing sufficient warden force to prevent hide hunting and slaughtering for woods camps, or in other words confining the hunting to the present open season, we are satisfied that the supply of large game will last for an indefinite time.

Game Birds.

All reports received from wardens, guides and sportsmen emphasize the fact that there is a great scarcity of partridges in the State generally, although in some particular localities they have been reported as plenty. It would seem that the supply is growing steadily less. Interested persons pretty generally agree that market hunting is the real cause of it, although many other reasons are suggested, such as foxes, hawks and deep crusty snows in winter and cold, wet weather in spring time.

It has been suggested by a considerable number of observant persons that a close time of two years be placed upon them to allow them to multiply, before they are entirely exterminated in this State. So far as we have been able to ascertain the minds of those interested, by extensive correspondence and thousands of circulars sent, it seems to be the prevailing opinion that the sale of partridges should be absolutely prevented for at least a term of years, or if not entirely prohibited by law, their sale should be restricted and regulated in the same manner as the traffic in deer is at present restricted and regulated. Others suggest that the use of dogs in hunting these birds should be prohibited. We have used our best endeavors to look carefully into the matter, as we deem it of great importance to the State, and trust that such action will be taken by the law-making power as will preserve this most valuable of all indigenous Maine game birds from extermination, or nearly so.

Boston, Jan. 16.—With the Maine papers devoted to pushing the fishing and shooting interests of that State the close season has not yet begun. Their columns are yet bristling with stories of shooting; their being no close season on their voices. They are now telling of the last snowshoe hunts of the guides. At each hunt each guide succeeds in taking his two deer. Probably he did not kill them during the early open season. Really one gets tired of so much slaughter, and wonders if it is possible for any game supply on earth to stand up under it. In the meantime the Augusta lawmakers are at the game also. One of the most important measures introduced thus far is one by Representative Smith, of Presque Isle. It proposes a license system for large game hunters. I hear that the matter is provoking much discussion, there being very warm adherents for the measure, as well as equally strenuous objectors. Section 1 of the bill reads:

"No person shall hunt, kill or take any moose, deer or caribou without first having procured the State hunting license therefore hereinafter provided, and having such license in his possession during the time he is engaged in hunting, killing or taking moose, deer or caribou."

The bill further provides that the State hunting license shall be issued by the fish and game commissioners. Only one license shall be issued to the same person in one year. Non-residents shall pay for the license \$5, and residents of the State \$1. Each license shall have one coupon attached, which entitles the holder to one moose; another coupon for one caribou, and two coupons for one deer each. The money received for these licenses shall be paid by the commissioners to the State Treasurer, to be used for the purpose of game protection.

Another very important measure is to be proposed by the Maine Fish and Game Association. It proposes to allow of the taking of deer in the month of September, by the paying of a fee of \$6 for the privilege. This measure is greatly favored by the camp and hotel proprietors. A number of the prominent timber land owners are said to have consented to the plan, provided the hunter hunts the deer under the direction of a licensed guide. Commissioner Carleton is said to have received letters from 250 sportsmen who visited Maine last year, favoring the plan—doubtless answers to his most peculiar circular, that the FOREST AND STREAM has already published. He does not say anything about those who have replied opposing the measure. Neither does he tell the Association that his circular was not forwarded to prominent camp owners on the Maine lakes—men who have visited Maine for years, and have been willing to uphold such game laws as were deemed for the good of the game protected. I can count a number of such camp owners who have not received Mr. Carleton's circular.

SPECIAL.

SOUTH HAVEN, Mich.—I have taken your entertaining and useful paper for nearly thirty years, and I find I need it all the more since the game has nearly disappeared from our locality.

H. W. S.

Old Bob Gerry, of Hyde.

The Eagle's Claw and Forty-six Bears.

Editor Forest and Stream:

I notice in your issue of Jan. 14 that Curator Brimley, of the State Museum at Raleigh, advertises for bears for specimens, therefore I write to say that if he will send into Hyde, Beaufort or Tyrrell counties, which occupy the peninsula lying between Pamlico and Albemarle sounds, in North Carolina, he can get all the bears he cares to give room to. If any one has lost any bears, that is the location to find them.

This intersound region is divided into alternating areas of swamp, cornfield and prairie, or savanna, with here and there a lake or an apple orchard thrown in; and the bears trade from one to the other, according to the season of the year, or as they have opportunity. These savannas are used almost universally as cattle ranges, and there have been at times large stock companies which grazed many hundreds of heads. In the early spring time, before vegetation has sprouted, the bears feed on the young junipers (white cedar), by stripping off the bark and sucking the sap. Later on they eat young ferns and all kinds of new growth, and insects; and afterward worthberries, coon berries and the like. Then they climb the black gums for the fruit, taking the green corn spring and then the nuts and acorns, and from fall to spring destroy cattle and hogs. In the green corn season it is the easiest thing in the world for them to come out of the marginal swamps by the fields and regale themselves on the farmers' roasting ears; and when cattle are running in the winter and berries and mast are done (gone?), and the cow peas and corn are stacked or housed, they naturally take to fresh meat. In fact, everything goes then. Stock yard and hog pen are not exempt, even when in close proximity to the dwellings. In hard winters, which happen periodically, the havoc among the herds has been so great that stringent measures have been employed to exterminate the ursine depredators. Spring guns, traps, deadfalls, poison, side-hunts and drives have been put into active use, and scores of carcasses have been gathered in. Still the slaughter continued among the cattle, and the sinner bears continued to get in their work, until their numbers were decimated. [Sinnabers are cattle bears, and always carry a white spot on the breast. Hog bears are smaller, and different. Dr. C. H. Merriam, please notice.] At the last the cattle were afraid to go into the slashes at all, and kept entirely to the savannas. The bears would climb the junipers, gums, and cypresses, where the trails passed, and lying along the extended limbs drop like panthers down upon the luckless animals passing beneath, sucking the blood from their necks and clinging to them as they ran. In the end the "critter" would succumb from freight, bleeding or exhaustion, and die miserably.

A good many years ago, I think it was as long ago as 1876, this nuisance got to be so unbearable that a wealthy cattle company operating in Hyde engaged the services of a shrewd colored man named Bob Gerry to clean the bears out. Gerry had been a valet of Stephen Whitney, of New Haven, Ct., during the Civil War, and after its close went with him to New Haven. He knew a thing or two. It was about the time the eagle claw trap was invented, and advertised in FOREST AND STREAM, and Bob obtained some extra large ones, big enough to take in a bear's head like the clutch of a human hand. Baiting these with rare chunks of fresh pork, he hung them up by chains to the lower limbs of the junipers and gums, within the length of a bear's body reach, and of course when bruin reached for them he was caught beyond reprieve or reprieve. The eagle claw held him firmly by the head, and all the artifices of his brain and dexterous claws could not unclasp the relentless grip. By this method and the use of traps and spring guns, Bob bagged forty-six bears in one season, filling many tubs and barrels with lard and hams, and shipping the meat to market, while the pelts brought \$15 to \$18 apiece, according to size. But there are others, big ones, scaling twice 200lbs. apiece; and Curator Brimley can take his pick of the lot by sending his order to Bob, or the postmasters of Pantego, Roper or Belhaven. Bob is seventy-eight years old now, but he works in a shingle swamp all same.

CHARLES HALLO

Massachusetts Covers.

FITCHBURG, Mass., Jan. 14.—Editor Forest and Stream: Here is a game report, which I take from our paper to-day, about the game conditions in Worcester and Fitchburg in Worcester county, but our gun club has made sad havoc with these infringers of the law, and likewise created a healthy sentiment on bird selling. But we ought to have in Massachusetts a law on all game birds from Dec. 1 to Oct. 1. Why won't the FOREST AND STREAM advocate that for its Massachusetts sportsmen? W.

The report reads:

Ruffed grouse, quail and woodcock are under the protecting wing of the law. The season has been below the average in number of birds killed. The work of Worcester County Game Protective Association in liberating quail last spring has won over to the propagation idea the most confirmed of doubters. Quail have been found in abundance and in unusually large flocks. As to woodcock the flights were about the average of the past half-dozen years, and for three or four weeks, beginning about Oct. 10, large numbers of flight birds were bagged.

Along with the close of the season there arises the annual agitation of dicker the game laws. The question of shortening the open season to cut out the month of December and perhaps the fifteen days of September is annually raised by far-seeing sportsmen, who predict the extermination of the New England partridge, properly called the ruffed grouse.

By the alarmist it is predicted that the partridge is doomed to the fate of the wild pigeon and the bison. Unlike trout and the game fish, the propagation of partridges in captivity has been proved an impossibility, and the choicest of the game birds of the country is doomed to extinction, even within the present generation, under the wholesale slaughter now legalized.

An official of Worcester County Game Protective Association says that every reliable authority predicts the

end of the partridge unless immediate protection is given the birds. In his opinion neither shortening of the season nor a five or ten-year close season will avail to protect the birds as long as the marketmen offer the present price for birds and so set up inducements for the slaughter. He favors as the only escape the absolute prohibition of the sale of game birds. This he believes will solve the market question, and materially decrease the killing now encouraged by the trade.

It is said that six men can be named among Worcester bird shooters who have bagged at least 1,200 birds this season. These shooters market their birds. Despite the excellent work of the Protective Association, snares have done a thriving business this season. In Rutland, Oakham, Templeton and Hubbardston, thousands of birds have fallen into nooses, and have found their way to Worcester and Boston markets. Along Cannasto Brook, Hubbardston, this season, four and a half miles of snares were set, and operated almost throughout the season. One farmer in Hubbardston received from a Worcester marketman a check for forty-four birds snared and shipped in one week. Thomas H. Davis, warden of the Protective Association, was unable to cope with the snares single-handed.

Only one conviction was secured. Jacob Shaffer, of Hubbardston, was convicted and fined \$20.

The law permitting snaring permits "the trapping or snaring of ruffed grouse, commonly called partridge, hares or rabbits, by an owner of land upon his land, or by a member of the family of such owner if authorized by such owner, between Oct. 1 and Jan. 1," was framed to allow the farmer to snare for his table, but has been prostituted until now, with birds at high prices, this clause in the game laws legalizes the most destructive form of bird killing and marketing. Dozens of men in Worcester county have made a business of snaring birds for market in the past three months.

Bird shooters who follow the sport not for the sport's sake, but as a money maker, kill as many birds in Worcester county annually as all other shooters put together. There is a growing sentiment against the inveterate hunter who markets birds and is out and blazing away from opening to close of the season, as long as there is a feather in sight and with the knowledge that game birds are fast decreasing.

Tanning Skins.

REPLYING to J. A. R. about tanning small skins, I will say that I have tanned, with the hair on, a number of skins of such animals as bears, caribou, deer, foxes, and some smaller animals. I do not know much if anything about the Indian methods of tanning, but I have been told by fur dealers that the Indian method (on such animals as needed the thorough removing of all grease from the hair) was not satisfactory. Such skins as I have tanned were to be used as mats or rugs.

A simple method, as given me by a Maine guide, has worked well on deer and caribou skins: Two cups of fine salt, one of powdered borax and one of alum to about a gallon of water (rain water). I remove any particles of fat or flesh from the skin, but do not try to scrape it much, and if the skin is dry soak it out well in water and put it in the solution, letting it stay from one to three days, moving it about in the solution once or twice a day. Then take it out and wring as dry as I can, and work it dry; then scrape well, and finish by going over the flesh side with coarse sandpaper.

With bear, fox, skunk, or such skins as have more or less grease in the hair I first soak well in water, and then give a thorough washing in several changes of warm water, using plenty of soap or any washing powder used to remove grease. After rinsing well, to remove soap, I put the skin in the solution, and if a bear skin let it stay about three days, turning and moving it about often. After taking it out and wringing as dry as possible, I put it in a tub containing two or three bushels of dry mahogany sawdust, and keep working it in the sawdust until it works dry. If it is a large skin, I put on rubber boots and keep treading and turning the skin, taking it out now and then and shaking out the dust. mahogany sawdust will work all through the hair, asing and brightening it. After the skin is worked I hang it up on a line out of doors, and switch it to get out all the dust. Treating a skin in this way is some work, but if the dust is kept dry and the skin is worked until it is perfectly dry, it will come out soft. I then give the flesh side a good scraping, using sandpaper.

Some of my friends who have bought fox skin mats have told me that they were unable to keep them a year on account of moths, although they had tried to take good care of them. I have never been troubled in this way with such mats of my own making, and have one now which has been about the house two or three years and has never been packed away at all. All of my rugs are taken out of doors once or twice a week during the spring and summer and given a shaking, and this is all the care they get.

When preparing a fox skin for a mat I wash the skin well, using plenty of soap; then rinse it well in clean water, and while wet give it a coating on flesh side of arsenical soap, such as taxidermists use, letting it remain on a few hours, and then wash the skin in several changes of clean water to remove to some extent the arsenic. I then have gone over the skin with a tanning fluid, such as many of the taxidermists sell, and afterward work the skin dry in the sawdust. I do not know that the tanning solution gives any better results than the alum and salt and borax, but it is easier to use and takes less time.

The working of skins of any sort dry in the sawdust seems to be the most important point. The Indian method of smoking skins, I understand, is to keep such skins from drying hard should they get wet, and is more to be applied to buck skin than to a skin intended for a mat.

My experience in tanning has been confined to some twenty-five or thirty skins of the kinds I have named, and has been almost wholly for my own use. A fur dealer told me, when I spoke of tanning some bear skins, that I could not do it so that they would last a year. Nevertheless I tried it on four bears which I killed one

fall, and I have those skins as rugs now on the floor. I have had them for five years and they are in perfectly good condition. As for such skins as deer and caribou, they look well for a time, but I never knew of one on which the hair did not break off badly; and the same with a moose. They might last better if in the short coat, but those I have were all killed in the late fall or early winter.

Your correspondent Mr. Hough's suggestion of using a strap over the instep and ankle of a rubber boot is first rate. Heretofore I have found rubber boots very destructive to the heels of woollen socks. Rubber boots are the only boots I find satisfactory to use in all kinds of snow when out waiting for a fox, and hereafter I shall follow Mr. Hough's advice and strap down the plaguey things so that they cannot keep slipping up and down at the heel.

C. M. STARK.
DUNBARTON, N. H.

Educate Them.

PASADENA, Cal., Jan. 6.—*Editor Forest and Stream:* I enclose a few clippings from the Los Angeles Times, Hotel Coronado, San Diego, items, which are self-explanatory, and are only a few of the many items of like purport recently published:

"C. H. Lester and W. H. Dupee, of Chicago, returned last night in a soaking rain from lower California, where they spent two days shooting quail. The most of the shooting, however, was compressed into the hours between 10 and 4 o'clock yesterday. They got 216 birds, stopping then on account of the rain, though passing through coveys of from fifty to 100 birds each."

"Capt. J. S. Sedam and A. B. Daniels, of Denver, and John Markle, of New York, went out again yesterday, in spite of the rain, to get a few ducks. They, with E. S. Babcock, as fourth man, hold the record for duck shooting, having killed 671 birds in one day at Otay Lake, all with 12-gauge guns, wing shots."

"James T. Hayden, of New Orleans, and Judge C. N. Sterry, of Los Angeles, are out in the back country somewhere, getting ducks and quail. They telephoned in night before last that they had shot 153 quail the first day."

"Capt. Sedam and A. B. Daniels returned Saturday from lower California, where they went with Chick and Hamilton, of San Diego. The quartette slaughtered forty dozen and one quail in two days."

Our resident sportsmen as a rule recognize the necessity of moderate indulgence in the killing propensity, and all the clubs controlling the shooting grounds about Los Angeles county have enacted rules limiting the bag per gun and the shooting days as well.

While the "glad hand" is extended to every true sportsman from the East, as your columns constantly attest, every season we are afflicted by a visitation of that detestable species called the "game hog." Read the above clippings and then ponder upon the scarcity of game and its causes.

The correspondent in his zeal to furnish all the news has given its paper good grounds for the editorial comment, clipped from the same paper:

"It is about time for the enactment of a law limiting the number of game birds or fowl that a man may kill in one day. The best gun clubs limit the bag that members may make, and also restrict shooting to certain days in the week. Reports of the performances of so-called 'sportsmen' who infest Coronado prove the necessity for protection of ducks from game hogs and pot shooters. Three men visiting Coronado killed 338 ducks in one day, and brag that they would have killed more but for the rain. And recently False Bay was covered with dead ducks killed wantonly by 'sportsmen' of the same stripe. The sport will not last long at this rate."

Cannot you get these men to subscribe to FOREST AND STREAM? They need a little education along the lines which your paper has fought valiantly for—the moderate indulgence of the sporting instinct; in fact one cannot read your editorials and be a game hog at the same time.

FRANK S. DAGGETT.

Death of Charles Daly.

MR. CHARLES DALY, senior member of the firm of Schoverling, Daly & Gales, No. 325 Broadway, died on the evening of Jan. 11 at his home, in Summit, N. J.

He had been at his office in New York until the usual hour, and spent the evening at home in pleasant intercourse with his family. About 11 o'clock an attack of apoplexy proved almost immediately fatal.

Mr. Daly began his business career with the old firm of Tufts & Colley about 1858, and afterwards with Messrs. Sargent & Co., and later with Messrs. H. Boker & Co., whom he left in 1865 to join Mr. Schoverling. They commenced business in a very modest way as gun dealers in Barclay street, removing the following year to No. 52 Beekman street, and later to Nos. 84 and 86 Chambers street, and then to No. 302 Broadway, where his firm handled every variety of sporting goods. Mr. Daly was one of the incorporators and for many years president of the Marlin Fire Arms Company, of New Haven, Conn. He was one of the organizers of the Hardware Club, and took an active interest in its success, and was a member of the Colonial Club. He was a member of the Presbyterian Church. He had been a widower for some ten years. A son and a daughter, Mr. Charles Howard Daly and Mrs. R. Courtney King, survive him. Mr. Daly leaves a large circle of friends endeared to him by his sincerity of character, largeness of mind and generosity of impulse.

NEW YORK, Jan. 16.—*Editor Forest and Stream:* At a meeting held to-day, Mr. A. H. Funke, chairman, Messrs. W. J. Bruff and Henry Werleman, committee, it was decided to send you copy of the resolutions which were adopted, and which I enclose.

At a meeting held at the office of Hermann Boker & Co., January 16, 1899, to take suitable action in reference to the death of Charles Daly, of the firm of Schoverling, Daly & Gales, the following resolutions were unanimously adopted:

Whereas, It has pleased Almighty God, in his inscruta-

ble wisdom and providence, to remove from this earth our friend and fellow member of the sporting goods trade, Charles Daly; and

Whereas, Our friend stood high in the esteem and affection of his business associates and companions, with an honorable record for business probity, coupled with a genial disposition toward all; therefore be it

Resolved, That we extend to his bereaved family, also to his business associates in the firm of which he was the senior member, our fullest sympathy and condolence for their irreparable loss.

Resolved, That we most tenderly convey to his grief-stricken children the sorrow and sadness we feel at parting with their protector and our friend.

Resolved, That a copy of these resolutions, suitably engrossed, be presented to each of his children.

Mr. Gilman and Section 249.

Editor Forest and Stream:

My attention has been called to the fact that Mr. Theodore P. Gilman, who, as the representative of the Marketmen's Association, did all that he could to retain Section 249 in the game laws, and to defeat the efforts of the sportsmen to repeal the same, is again urging the re-enactment of the obnoxious section and has made the assertion that I am in favor of its re-enactment, and has quoted Mr. F. J. Amsden as having also experienced a change of heart, and agreeing with him on its desirability. As to myself, I hasten to say that the assertion, of made, is absolutely false, and I am certain the same may be said of Mr. Amsden. The New York Association for the Protection of Game for three years fought the fight which finally resulted in the repeal of Section 249, and will resist by every means in its power the attempt to again place this section on our statute book, and no member will more heartily expend time and trouble in that direction than its secretary. The New York State Fish, Game and Forest League can also be counted on to oppose any such action as that proposed by Mr. Gilman.

ROBT. B. LAWRENCE,

Sec'y N. Y. Assn. for the Protection of Game.

ROCHESTER, N. Y., Jan. 16.—*Editor Forest and Stream:* Kindly state in your journal that I am most decidedly opposed to a restoration of section 249 to the game laws. I understand that such a movement is on foot, and it has been stated that I am favorable to it.

I also understand that if this does not succeed, then a compromise will be offered, permitting the sale of game for three months after the close of season. I am opposed to this also.

FRANK J. AMSDEN.

The New Jersey Game Warden Case.

THE case of the New Jersey game warden who, in October last, killed an Italian gunner, was tried last week, resulting in a verdict of manslaughter, and a penalty of eight years' imprisonment.

The warden, it will be recalled, had been sent to arrest two Italians, who were shooting robins. When called on to surrender, one of the gunners handed over his gun, but the other, as the warden claimed, menaced the officer, leveling his gun at him, and the officer thereupon, as he stated, shot in self-defense.

In passing sentence, Judge Dixon said there was no doubt that the prisoner had been justly convicted. His act in attempting to arrest Canova and Danielle, he said, was clearly illegal. The warden had not displayed any badge of authority to warrant him in making an arrest, nor had he seen the Italians commit any offense against the game laws. It was shown that on the way to the woods the warden had stopped at several saloons, and Judge Dixon was very severe in his criticisms upon the warden having indulged in drink when about to discharge an official duty.

Public Sentiment and the Game Laws.

BATAVIA, N. Y., Jan. 14.—*Editor Forest and Stream:* The Fish and Game Protective Association of Genesee County has had five cases of the violation of the laws during the past ten months, two of which were convictions, and three were settlements by payment of fines, making a total amount of convictions and fines, \$178.56. Four of these cases were for the violation of fish and game laws, and one case for the shooting of song birds. While game protective societies have and will continue to do much good, and their influence grow, still they will always be unable satisfactorily and effectively to enforce the game laws until the observance of these laws becomes popular with all classes of people, irrespective of tastes for field sports, and I think the indications are that observance of the laws is receiving more general attention, and this feeling could be greatly augmented if the daily papers would assist the sportsman's journals in the work.

W. L. COLVILLE.

Maine Game Records.

THE figures of shipments for 1898 have been given out by the Bangor & Aroostook Railroad, showing the following record:

	October.			November.			December.			Total.		
	Deer.	Moose.	Caribou.	Deer.	Moose.	Caribou.	Deer.	Moose.	Caribou.	Deer.	Moose.	Caribou.

In 1897 and 1898 the moose shipments were from Oct. 15 to Dec. 1 only.

The above statement, compiled from records kept by station agents, comprises only game shipped by visiting sportsmen, and does not include that killed by native hunters, nor the large quantity consumed in camps.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

A Miscarriage of Justice.

From the Paterson, N. J., Sunday Chronicle.

THE result of the trial of James L. Tooker, Jr., for manslaughter on Monday last was a discredit to justice in New Jersey.

The point which would be apt to first strike a disinterested observer was the presence in court of foreign counsel. There come to these shores annually hordes of semi-barbarians, who have no love for this country and no regard for our laws. A few of these remain for an indefinite time, but most of them return to their own homes after having taken from the decent American laborer a large share of the work which should come to him. These men do not intend to become American citizens, and while here they are governed by their own rules and usages. They have formed here the Italian Society of the United States, an organization which has gained an unenviable notoriety in some parts of the country under the home name of Mafia. This organization usurps the rights of administering law; it is a conspiracy here among us to set aside the laws of this country. It protects all its members against the infliction of punishments by our courts. Wherever a money penalty is imposed it is paid out of the treasury of the society. One of the most common forms of violations of the law on the part of members of this society is the gunning for birds, contrary to our laws. Of the forty odd Italians arrested in this part of the State during the past year, charged with violations of the gunning laws, not one went to jail, the fines of all being paid out of a common treasury, a premium thus being placed on defiance of our laws. But these marauders do not confine themselves to violations of the gunning laws; they kill everything that affords a target, and landowners have been loud in their complaints on account of the loss of domestic fowl. Evidence tending to show the characters of these pillagers was rigidly excluded by the court. Yet this society, which guarantees immunity from punishment for violations of our laws, was openly represented in court by paid counsel, the first time in the history of New Jersey that we know of where private interests were permitted to aid the State in prosecuting an accused person. The partnership between the State of New Jersey and the Mafia is hardly a pleasant subject for contemplation.

Stress was laid upon the supposition that the accused was under the influence of liquor at the time he fired the shot. We do not believe with some judges that a man should be sentenced to safe keeping behind the bars for taking a drink of beer, but in this present case we do not believe that any reasonable man would come to the conclusion that the defendant was intoxicated. According to his own admission he had taken three small glasses of beer; according to the oath of his companion he had taken only three, having once taken a cigar. After having started on the errand on which the authorities of the State sent him, the defendant walked four or five miles through the bracing mountain air. The supposition of his intoxication was based on statements made by a witness who did not see the defendant until just before 5 o'clock; the shooting occurred at 2 o'clock. The State detectives and the agents of the Mafia had scoured the country to find more evidence of partaking of beer, but were unsuccessful; the reason for their failure to succeed will be apparent to all.

The contention on the part of the State was that there was not sufficient provocation to justify the shooting; in fact, that the provocation was very slight. If the defendant could be induced to shoot by merely seeing a violator of the law before him, how was it that he did not shoot Daniele, with whom, according to undisputed evidence and the admission of Daniele himself, he had a scuffle for the possession of a gun? There was more provocation to shoot Daniele, according to the latter's story, but the defendant made no attempt to shoot Daniele. The answer to this question is to be found in the statement of two respectable American citizens and officers of the State that Canova had raised his gun to shoot the defendant.

In the charge of the presiding judge every point which could possibly be made against the defendant was brought out with force. The most incisive of these was the argument that if the defendant had only exercised his right there was no cause for regret, and that the inference accordingly was that the defendant was conscious of some wrongful act, and that his feeling was remorse and not regret. We do not see how it is conceivable that a man who kills another can escape being the victim of acute regret. The man who shoots a burglar or highway robber cannot but regret the act. We have known cases here in Paterson where conductors and engineers refused to pursue their occupations because they had been the means of depriving a human being of life even when all the facts plainly showed that there was no culpability on their part, and when they had been fully exonerated by public tribunals. Regret at taking life is inherent in the breast of every human being. In the case of Tooker we find a man of more than ordinary intellectuality and sensitiveness suddenly confronted with the fact that he had deprived another of his existence. He was excited, his mind confused and like a drowning man grasping at straws, he sought for extenuating circumstances; he recognized his own position and cried out that he had not intended to kill, even though his own life was in danger. Artfully this exclamation on his part was made use of to indicate that he had been guilty of manslaughter. Every word used by a man laboring under the most intense excitement was construed against him.

The verdict was not the result of calm deliberation on the part of the jurors. If any credence can be placed in stories circulated about the court house, and which have since been corroborated by the jurymen themselves, their first ballot stood nine for acquittal and three for conviction of manslaughter. The jurors were boisterous, and if the secrets of the jury room leaked out it was their fault. A majority of them stood in favor of acquittal when word was sent that the presiding judge intended to go home unless the jurors had agreed. This meant that the jurors would be put to the inconvenience of being locked up all night. Then it was announced that they had agreed. The constable who was sent to the jail to bring the prisoner into court advised him to take his effects with him, as the verdict would be one of acquittal. Buoyed up with this hope, Tooker heard the verdict which

consigned him to prison for a large part of his life. Could more refined cruelty be imagined?

As to the judgment of the court, we know that we are simply voicing public sentiment when we say that it was harsh, cruel and uncalled for. The crime of manslaughter consisted in accidentally killing when there was no intention to kill; such was the theory laid down by the court on which the verdict was found. Eight years is too much even if every contention on the part of the State had been admitted.

The Right to Make Arrests.

UNPLEASANT recollections about his own arraignment on a charge of having violated the fish and game laws were perhaps flitting through the mind of Judge Dixon when he indulged in his denunciation of former Game Warden Tooker previous to the imposition of sentence. If everybody believed the law to be as laid down by Judge Dixon the violators of the law would have an easy time of it. Judge Dixon declared that the wardens on the occasion referred to had no right to make an arrest, as the law provides that they can make arrests only on a warrant or when they see the law violated. In the opinion of Judge Dixon the wardens did not see the law violated. The evidence on this point was undisputed. The wardens heard a shot fired near them; they saw the smoke arising from the discharge of the gun and saw birds flying wildly about, just as they do when they have been shot at; the wardens took only a few steps before they encountered two men with guns. Judge Dixon does not think this was seeing the law violated, even when the fact is taken into consideration that one of the men had birds' feathers sticking on his coat. If Judge Dixon's construction of the law is correct there will be few arrests made in future, for it would require remarkably clear eyesight to see the shot leave the gun and strike the bird. This opinion of Judge Dixon is probably on a par with another opinion he delivered some time ago, which caused the Supreme Court subsequently to remark: "If the law is as claimed no man who respects himself could undertake the performance of the duties of office."

CHICAGO AND THE WEST.

Pheasants.

Mr. H. F. Bosworth, of Milwaukee, Wis., whom I take to be the largest and most successful breeder of ring-neck and Mongolian pheasants in this part of the country, says that his birds are doing very well, and that the farmers still continue to protect those liberated in the vicinity of Hartland, Wis. Mr. Bosworth tells me that he is getting a great many inquiries for these birds from different parts of the State of Texas. The Mongolian pheasant experiment will become an industry in this country before long, and if it shall enforce upon the average mind the fact that there is such a thing as protection, and such a thing as a creature worth protecting, then the pheasant will not have come to us in vain.

Sportsmen Butchers.

I am in receipt of a letter from Mr. M. D. Grew, of Portland, Ore., who speaks to the point on interesting subjects. He says:

"Having been a reader of FOREST AND STREAM for a number of years, and knowing its liking for the market shooter and game hog, I thought the enclosed clippings might be of interest to you. The most of this game is killed and sold by sportsmen, so called, and the height of their ambition is to kill more than the other fellow. Six of us, workmen, leased a lake to shoot on last fall, and our best shoot was 106 ducks, which was twenty-two too many. I think a dozen birds ought to be enough for any man in one day, especially ducks, grouse and pheasants. I forgot to mention that the clippings were from the Morning Oregonian."

This is the right sort of talk from the right sort of a sportsman. The newspaper clippings referred to uncover rather a nasty state of affairs out in the State of Oregon, and I am pleased to see the most important newspaper in Portland is going after the so-called sportsmen, who are really worse than any market hunters. Personally, I do not believe in market hunting, but some of my best friends are market hunters. For the man who has means, and is not obliged to sell his game, but none the less does butcher and sell it, I have no use whatever. Here are excerpts from the Oregonian stories:

"Several years ago there was quite a cry against the market hunter. It was alleged that good-for-nothing worthies put in the better part of seven days out of the week loafing about lakes and destroying wildfowl, and that the sportsman proper did not get his deserts. Very correct was this, but now a new evil confronts us. There are those who dearly love to hunt ducks. Some of these parties are famous shots, and rarely let a bird escape. There is an annual flight of ducks down the coast line of this continent, and a great many find their way into the Columbia valley. The natural food of wildfowl has been (thanks to a blunder of the United States Fish Commission) largely destroyed by the carp. Before the advent of the carp natural food was very abundant, and if birds were persistently hunted, even in the most-favored lakes, they soon changed their flight. The above-mentioned persons, in their desire for good shooting, bait certain spots with large amounts of grain, and as a result many ducks are killed. To reimburse themselves for this outlay the birds are sold, and more grain is scattered. It soon becomes a regular business; the more grain scattered, the more birds for sale. It also becomes a sort of competition between the different hunters to see how many birds they can bag. In the writer's opinion this is all very wrong, and he does not think any man should be allowed to kill, unaided, between 1,500 and 2,000 ducks in the course of two or three months. Something must be done to put a stop to the slaughter, for the markets are more overburdened with game than they were in the halcyon days of long ago—in the days when any one could go out, and if he were a fair shot soon secure a few birds, the remainder of the flocks decamping to other feeding grounds."

"Stringent means will have to be adopted or these 'sportsmen' will soon clean us out."

"The recent wholesale slaughter of wildfowl by Portland 'sportsmen' has had the effect of overstocking the market with all varieties of ducks and geese, and the result of the oversupply has been a downfall of prices. Yesterday a prominent Front street commission man sold a lot of 900 mallard and teal ducks and widgeons for a total of \$45, or at the rate of 5 cents apiece. Another merchant disposed of a lot of 700, 100 of which were mallards, and the remainder teals, widgeons and geese at 50 cents a dozen. Both sales were forced, for the merchants had either to clean up their stocks at once or find themselves with a lot of unsalable fowl on hand."

"In speaking of the stagnation of the market, a merchant said that the whole trouble was caused by Portland 'sportsmen,' who have been in the habit of making Sunday visits to neighboring duck ponds and returning with bags of 300, 400 and 500. The ducks have been placed on the market all at once, and, together with the receipts from the regular country shippers, have swelled the stocks to such a size that frequent clean-ups have been necessary. The ducks sold yesterday were in fine condition, but they had to be either sacrificed or thrown away, and the dealers took the former course."

"Duck-Shooting Record Broken.—Frank Thorne, Frank Holcomb, M. Ellsworth, F. A. Daley and E. Bate-man, who shoot at Deer Island, made the biggest bag of ducks, Sunday, ever heard of in this section. The lake was skinned almost entirely over with ice. The ducks were driven out early in the morning and went over into the Columbia. Holes were broken in the ice, and decoys placed out, and about 10 A. M. the ducks began coming back. From 10 to 12 the shooting was something wonderful, the ducks being anxious to get into the open water with the decoys. In all, 506 ducks, mostly mallards, were shot during the day; that is, 506 were bagged, but many were left on the ice which could not be retrieved, as the ice would not hold up a dog, and a number of wounded ones got away into the brush, where the minks and coons will attend to their cases. As usual, Thorne was high gun, killing about half of the 506. When he saw that ducks which fell on the ice could not be retrieved he shot so as to have his birds fall on land, and even then his dog was completely used up retrieving them. There were a great many ducks brought to market yesterday. Men and boys brought in sacks full of them, until no more could be sold. The freezing of the ponds and lakes where they feed is very rough on the ducks, and they soon begin to get thin, and if the cold lasts must either go South or down to the coast. There have been more ducks sent to this market this season than ever before, and they have been of better quality than usual, but if the cold snap continues the supply will soon be cut off. There is, however, a large lot in cold storage, which will last for some time."

Human nature is a great thing. The man who preaches usually gets himself disliked. A good many of us like to shoot, but I don't think just everybody cares to conduct himself after the fashion of these Oregon fowl butchers. Sometimes I think the American sportsman does not deserve any game, because he does not want to protect any game.

Rapid Fire.

A North Dakota paper, mailed me by a friend, gives a calm little account of some rapid-fire work done by a plain, unvarnished boy, who lived in the West, near Custer, and who was evidently learning how to roll a gun:

"A boy twelve years old became the possessor of a .44cal. Winchester rifle, and placing a cigar box across the railroad track he began shooting at it for a mark. So exciting was this practice shooting that he did not see a hand car coming down the track, but such was the case, and so rapid was the working of the gun that he placed one ball in Mr. Englebird's shoulder, another ball grazed the leg of a second person, and another struck the tools on the car—all done while the car was moving the length of the cigar box."

A Hudson Bay Knife.

I had quite a merry Christmas this year, all things considered, and had occasion to reflect that I had quite a lot of friends on earth. One of the things that Santa Claus brought down the steam pipes of my flat was a knife. The first Christmas present that I can remember in all my life was that of a knife. I was then a beautiful boy, with trustful blue eyes and lovely yellow hair. I don't know how old I was, but I can remember it to-day. It was about the time I was wearing my first pair of trousers, and I was standing up trying to get one foot through the leg of that garment while I balanced on the other foot. To me entered Santa Claus, bearing a knife, a Barlow knife, a wonderful and joy-giving thing. I remember that I gasped and fell, giving up the attempt to negotiate the garment. From that time to now I presume I have perhaps had other knives given me by Santa Claus, but I never had so big a one as I got this Christmas. It was something like a foot and a half long, and three inches across the blade, with a backbone like a beam and a total weight of a couple of pounds or so. It was in effect a regular Hudson Bay knife, or "Hudson Bay dagger" of the old buffalo days. This form of knife has been made at Sheffield, England, for a century or two, I presume, and was once a regular part of the implements of the Hudson Bay man in the Northwest. It was a splendid all-round tool, made of excellent steel. One could cut down a tree with it, dig a grave with it, cut up a buffalo with it, or dissect his fellow man with it, as he most preferred. It took the place of both butcher knife, skinning knife, hammer, axe and spade, and I presume was as useful a single tool as could well have been devised. The regular price which the Hudson Bay Company charged for this knife in the early days was twenty beaver skins, and it was held cheap at that. In my story last year of our hunt on the Blackfoot reservation I told how our friend Billy Jackson had one of these old-time knives. How old it was no one knew, but it went far back into the buffalo days. The steel in this

blade was perfect. When we wanted to open a can of frozen beans we gave it to Billy, who with one whack of his knife would cut it clean through the middle. This he did many times, but the edge of the knife did not seem to be affected. It was with this knife that Billy built his mountain lion snares, fixed up his bait house, etc. One day Mr. C. S. McChesney, of Troy, N. Y., one of our party, expressed an admiration for this old-time knife, and it was just like Billy Jackson to unbuckle it and hand it to him. I presume that Mr. McChesney never had a gift that he valued more highly than he did this old-time weapon. All his friends asked him where he got it, and where duplicates could be had. Mr. McChesney nosed around the importing houses at New York city, and finally ran out a Sheffield trail and got at the makers of these knives. It was thus that, knowing how delighted I would be with one of them, he sent me this for Christmas. Neither he nor any one could have delighted me more. From this time on, Capt. Bobo, of Mississippi, has got none the best of me in a bear fight, when it comes to a show down of knives. The Bobo bear knife is a Mississippi evolution, and is not dissimilar to the old Hudson Bay dagger.

By the Way.

By the way, speaking of Capt. Bobo, here is a letter for him from Ernest A. Bigelow, of Sutton, Quebec, who says, "Will you kindly give me the address of Capt. Bobo, or of any one else you know of who keeps dogs for bear hunting? I wish to buy a pair."

I presume Capt. Bobo can still be reached by addressing him—Capt. R. E. Bobo, Bobo, Miss. Whether he would part with any of his bear dogs is another question. A good bear dog is worth much frankincense and myrrh. I presume Mr. Bigelow has good bear dog material all around him, but first you want to get your bears, and train your dogs on bear and nothing else. After that you probably won't want to sell your good bear dogs so long as there are any bears left. But Capt. Bobo is the soul of generosity, and it may do no harm to try him anyhow.

The Old Gun.

A friend of mine writes me, "By the way, you should have branded that article of yours about the old gun that appeared in the last issue of *FOREST AND STREAM* 'Delayed in transit.' We do not want our reputation as law-abiding citizens to suffer, and you start off just as if you had that day received a letter from me, asking you to come over here and shoot quail and partridge. Every one knows that in a country where both of these game birds flourish a good, tight closed season is in force after the first of January."

"Delayed in transit" will cover the above case. Of course there is no imputation of laxity to the morals of my friend or myself.

Footwear.

Still another friend writes me this week and wants to know where he can get a pair of soft, heelless rubbers with leather tops, "such as Mr. Schultz wore in the Blackfoot hunt." It is an odd thing to say, but I do not believe these goods can be bought in Chicago, in spite of the fact that we have here the largest mail order houses in the world, who wish to supply the mountain and pine country trade. There is no footwear on earth so good for snowshoeing as precisely that above mentioned. The shoes were not stiff and heavy, but of pure, soft rubber; flat-soled inside, and with wide, rolled edges to take the cutting of a crust. The rubbers were the Gold Seal rubbers made by one rubber house, and the leather tops, I understand, are the invention of a Wisconsin man. These shoes were bought at Kalispell, Mont., and they cost there \$2.75 a pair. If some good house will take hold and advertise these shoes in *FOREST AND STREAM*, they can sell a lot of goods. I have often referred to this sort of footwear before.

Scattering.

Mr. A. G. Jordan, of Arrowhead, B. C., writes me: "I am sorry not to have been able to call on you while on my way East from Alaska, but I had to turn back and go to the Peace River. I was looking forward to an enjoyable chat. I arrived home the last week in December, after one of the most exciting trips it was ever my lot to take part in, and I have been in some pretty tight corners. I have traveled all over British Columbia and Alaska." Mr. Jordan wants to know if a story of that sort of thing would be interesting. Sure! Send it along. Gokey, of Dawson, has been out deer hunting and killed five deer.

Wardens at Zilwaukie, Mich., seized thirty barrels of short fish this week. Warden Du Chaine was just going back to Bay City when he heard a New York dealer say that the officers had overlooked a lot of twenty barrels which he had. Warden Du Chaine took the next train back and seized the twenty barrels. This must have seemed to the dealers a good deal like coming back after the safe.

Mr. E. W. Davis, of New York city, asks me where to go for sport in Texas. I have told him to try the new High Island country in Texas. By the way, what has become of Dick Merrill, who was en route for that point at last accounts? I should be glad to have a report of the shooting in that locality.

The Charlotte News, of North Carolina, has issued a special edition of great interest to hunters and fishers. It gives towns in many different counties, describing all the local peculiarities, sort of shooting, hotel and guide rates, and all those particulars which are just such as all sportsmen tourists like to know in advance if possible. As each winter there are a great many inquiries for Southern shooting country, I would suggest it might be well for persons intending to go South to write for a copy of the above-mentioned paper, which sets forth the claims of North Carolina, as below:

"North Carolina is the premier State of the South for the hunter and fisherman. Extending nearly 500 miles from east to west, and at its widest point nearly 200 miles north and south, it embraces sea coast, inlet, swamp, meadow, upland, plateau and mountain; also lake, river and sound, and countless acres of unbroken and untouched virgin forest. Included in this vast and varied domain is nearly every known variety of game pe-

culiar to the temperate zone. To attempt an enumeration would be simply to furnish a list of all varieties of game, with which we of these latitudes are familiar. Particular attention, however, is invited to the attractions of the Pee Dee Valley, for quail, turkeys, ducks, geese and snipe; to the regions adjacent to Wilmington, for fresh and salt-water game fish, and for deer, bears, ducks, geese, snipe and all water fowl; and to the magnificent western North Carolina section for all kinds of larger game, including bears, deer and here and there a panther. Quail are unusually plentiful nearly all over the State; turkeys more or less so, but they are particularly numerous in some favored localities which will be briefly described.

Houses.

I have been startling my friends by telling them that some day, when I get rich, I am going to build me a log cabin here in Chicago. I have tried several different ways of living in this town, and none of them are any good. I quit my club because I found the girl frying beefsteak on the top of the stove, and I am thinking of abandoning the marble palace where I now live because I do not like the babies who live under me. I believe I could be comfortable in a log cabin, where I could drive nails into the wall. My friend Mr. Schultz and I have figured out a very nice plan for a log cabin, and I think if some one would give me a couple of acres of land and a few logs, I could make myself quite comfortable, and be safe from the babies that cry in the night. There is no sort of house pleasanter to live in than a log cabin.

Speaking of houses, it is quite an idea which has just been perfected by those two thoroughgoing sportsmen, Mr. W. B. Mershon, of Saginaw, and his friend, Mr. Morley. These two have formed a partnership for the manufacture of portable houses—practical and convenient. These houses are built in the great mill plant of W. B. Mershon & Co., of Saginaw, and it was there I saw the process of their manufacture during a visit last fall. The houses were as neat and light and beautiful as any one could ask, and so ingeniously made that they could fairly be carried in a shawl strap, and could certainly be taken over any road into a camp by the same wagon which would be necessary to transport a tent and outfit. With one of these houses a fellow can defy the weather and put up his camp for the entire season. These houses must, I think, prove most convenient for use about summer resort places, as servants' quarters, extra guest rooms, etc. They are solid as a rock and can be put together by any intelligent boy. There is not a nail to be driven, and all one needs is a wrench and a screw driver, to tighten up the whole concern and make it perfectly firm and strong. I always thought Mr. Mershon was about the best hustler around a camp that I ever saw, and he has hustled out something here of which we shall hear a great deal more. I don't know that I shall trade my log cabin, when I get it done, for one of the "M. & M." portable houses, but if it should come to a show down on a traveling trip. I am afraid I should have to leave my log cabin at home, whereas I could take one of these shawl strap cottages, anywhere from 3 to 36 ft. long, and set up a studio wherever I happened to get caught at night.

How Much Grub to Take Along.

Mr. H. C. Griswold, of Watkins, N. Y., recently wrote me a letter similar to many I have received at different times. He says: "Can you give me the amount of flour, salt, tea, coffee and other eatables necessary for three men in the woods for five months' trapping, etc. You have had experience in the woods and can tell about this, and if you will do so you will oblige me and I will not bother you any more."

The answer to the above letter might be one thing or it might be another, according to the personal preferences of the man making the estimate. I am not trusting to my own judgment or experience in giving the estimate which I do, but to-day I placed Mr. Griswold's letter in the hands of Mr. J. W. Schultz, who was here in the office. Mr. Schultz is an old-time guide and outfitter who has taken out very many parties in the Western country, more especially in the Northern Rockies. He submits the following estimate as being about what he would advise, and I have every reason to believe that it would be about right, which is to say, ample and not too extensive. I suggest the preservation of this list by others who may be in Mr. Griswold's position: 300lbs. flour, 200lbs. bacon, 100lbs. sugar, 5lbs. tea, 30lbs. coffee, 150lbs. beans, 300lbs. potatoes, 50lbs. onions, 8lbs. baking powder or 2lbs. yeast cakes, 10lbs. salt (food only), 75lbs. evaporated fruits, 5 gallons syrup, 25lbs. rice, 50lbs. oatmeal, butter, Worcestershire sauce, sage, etc., ad libitum. Dried vegetables are also very good. It should be remembered that the above outfit is for three men for five months. Estimates for other times or parties can be scaled from the above. This is plain food for plain men. The list would ordinarily be fuller for pleasure parties.

On the Great Lakes.

The Fish and Game Commission of Michigan has been waging a hot fight this fall with the violators of the laws on whitefish and trout on the Great Lakes, more especially with the Beaver Island fishermen. Most of this work has been under the charge of Deputy Brewster, and it has been successful. It cost the State of Michigan over \$700 to hire tugs and men in the police work on Lake Michigan.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

New York Game Law.

THE Assembly Committee on Fisheries and Game: Messrs. Axtell, of Delaware; Bryan, of Jefferson; Halleck, of Suffolk; Kelly, of Herkimer; Sage, of Albany; Doughty, of Queens; Davis, of New York; Beede, of Essex; Pickett, of Clinton; Bashford, of Columbia; Meyer, of New York.

The Senate Committee on Forest, Fish and Game Laws: Messrs. Brown, Chahoon, Malby, Ford, D. F. Davis, La Roche and Havens.

OKAHUMPKA, Fla., Jan. 14.—The quail shooting and black bass fishing are both very good at this place. The Clarendon Hotel furnishes boats free of charge and bird dogs and team when out for the entire day. J. B. W.

Camp Cookery.

Editor *Forest and Stream*:

Do you not think it possible that Col. Mather could be persuaded to write a cook book?

There is crying need of a treatise on game cooking in camp and kitchen.

The Colonel knows it thoroughly, and could tell it so pleasantly that the guild would rise and call him blessed. Put it before him as a duty, and enter my name for two copies—one each for camp and kitchen.

LEWIS HOPKINS.

[Did Mr. Hopkins ever test the recipes given in Seneca's "Canoe and Camp Cookery"? They are accounted good ones.]

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

A Question and Some Answers.

THERE are a whole mess of things that I'd like to know that seem to be important, but I never mention them, because I don't believe that any one else knows the answers to them, for they are such as "Lord Dunderbary" classed as "things no fellow can find out." But my question is not in this category; it's a simple thing, and as I have been answering questions for years, this will show that I can ask one.

For about fifty years I have been bothered about a berry that I met in boyhood, and have never met since. I never knew but one individual bush which bore it, and every year, and for a dozen years up to 1853, I ate berries from it. The bush grew in a ravine back of the sulphur spring called "Harrowgate," above the B. & A. R. R. near Greenbush, now Rensselaer, N. Y., opposite Albany. John Atwood called them "cedar berries," and my recollection of the bush was a branching shrub about 3 ft. high with dark green leaves like spruce or cedar, but of course it was neither of these trees. The berries were like nothing I've seen since, and I've vagabondized quite a bit in the woods from Minnesota to Texas, and from New York to western Kansas.

The berries were, as memory recalls them, about 1/4 in. in diameter by 3/8 in. long, of a rich salmon color and sweet. A peculiar feature was that the outer or calyx end was open and a seed was plainly visible half-way down the berry. As I knew every hill, ravine, farm and bit of timber on both sides of the river within a radius of ten miles, and never found another bush bearing berries like that one, nor ever ran across one in other parts, those berries have bothered me for years to know their name and character. Some botanist will, no doubt, know all about them, and he's the fellow that I'm after.

While on the subject of berries, I must confess to being confused by some common names of them, as outside of a few water plants I know nothing of botany. I know that the wintergreen berry is called "checkerberry," but what is the "service berry," so often spoken of? I suspect it to be one of two which in the locality of my boyhood bore other names. There was an edible red berry that grew on a creeping vine, and the berry had two "eyes," probably the calyxes of two flowers, which had merged into one fruit. The berry was wider than long; one called them "squaw berries" and others termed them "eye berries." Then there was a plant which bore a cluster of white flowers in June on a stalk some 6 in. high, which turned into a cluster of a dozen to twenty red berries, and these we boys knew as "bunch berries," "pigeon berries" and "partridge berries." I suspect one of these two berries as being the "service berry," but why "service"?

Stocking a Trout Pond.

The following question came by mail: "How many trout will a pond of, say, one square acre, with an average depth of 10 ft., support? We would like to have an idea of what a small pond will stand, so as neither to under nor overstock."

This is hard to answer, because each pond is a problem by itself, and into this problem come flow, temperature and the food supply. All these things are prime factors and not one to be slighted or there will be no use in stocking the pond at all. But here goes as a random shot:

A square acre of water 10 ft. in depth, of a summer temperature not above 75 degrees Fahr., at the surface and not above 65 degrees at bottom, containing 4,840 sq. yds. of surface, or 14,500 cu. yds., should give breathing room to 20,000 trout of 1 lb. weight, if the flow of water is sufficient for proper aeration with submerged water plants to assist. This is a theoretical view, but no pond of that description could furnish food for trout of that number and size.

If ordinary conditions of flow and proper temperatures prevail, I would stock it with not more than 3,000 yearlings, or 1,200 two-year-olds; the yearlings to be not less than 5 to 6 in. and the two-year-olds from 9 to 11 in. That would be the maximum number, and one-half the figures the minimum. Introduce water cress in the shallows, but don't let it choke the flow, as it sometimes does. This plant helps to keep the water cool and is a good feeding ground for crustaceans, but it will need thinning in summer. Then plant the "fresh-water shrimp" *Gammarus*, and the *Asellus* or "water asel," and they will thrive among the cress and provide food for young trout. Insect larvæ will come without planting, and help feed the fish.

The only fish I ever recommend for trout waters is the golden shiner (*Notemigonus crysoleucas*), or the red fin (*Notropis megalops*); but these are never recommended unless the pond contains catfish, sunfish, bass or perch. If you have no fish but trout in your pond put no other in it. You may introduce the little newt, called also eft, evet, salamander, etc., and mis-called "lizard." Lizards have scales and live on land.

The best trout lake I know of is Wilmurt, in the Adirondacks. It is on a mountain top, and its outlet filters through the rocks, and breaks out some hundreds of yards below, barring the ascent of all fishes. Brook trout and newts are the only vertebrates in it.

Mosquitoes and Malaria.

All kinds of questions come my way. I must have a reputation for knowing a heap more than I do. A man writes and asks: "Do you believe in the latest theory, that mosquitoes propagate malaria?"

The elder Agassiz fought the evolution proposition, and he had a reputation as a great naturalist. In his day that term covered all that was known in scientific lore as it covered it in Humboldt's day, and he had a great following among those who thought that all religious ideas were to be upset just as the same class thought when Galileo declared that the world was round.

The late Prof. Edward D. Cope, when on a trip up the East River to Glen Island, bound for a dinner of the Ichthyophagous Club, said, in the presence of a number of us that: "Agassiz is too old to receive and entertain new ideas"; and added: "Science is advancing, and no zoologist should live beyond his sixtieth year." This was about fifteen years ago, and Prof. Cope died when about the age he had named.

This is cited merely to show that men are not alike. My early training and belief was that the poison of the mosquito was an antidote for malaria, and that its mission was to relieve dwellers in swamps from the evils of their environment. This was not an unnatural belief in that day, in fact it seems as if there was no need of the mosquito to propagate malaria in the swamps where it reigned supreme.

There the matter rested until the new theory was advanced, and if it is proved to be correct, I will accept it, although beyond the age-limit set by Prof. Cope. But is the case proved? The following will show the inoculation side: The quotation is from an article by Dr. Amico Bignami, lecturer in the Institute of Pathological Anatomy of the Royal University at Rome, in a recent number of the *Lancet*: "To sum up, malaria is a disease which is contracted by inoculation—a fact of which we have now obtained the first experimental proof, since we have seen that an individual who has never had malarial fever, by sleeping in a healthy place, where no one had ever previously taken fever, may sicken with malaria of a grave type if bitten by certain species of the mosquito brought in the adult state from some distant locality of highly malarious character. Further, everything points to the conclusion that inoculation is the only mode by which infection is acquired, since air and water as carriers of infection may be excluded, and because arguments based on analogy all tend in the same direction. This much, at any rate, we can assert, namely, that inoculation is the only mechanism of infection which has been demonstrated experimentally."

I don't like to be classed with the obstructionists mentioned by Prof. Cope, because I have passed his age limit, but having been a victim to what the doctors have called "malaria," in Brooklyn, during winter months when a mosquito could not live and not more than three feeble ones had been seen during the summer, I am inclined to attribute the "malaria" to something other than that insect.

FRED MATHER.

The Massachusetts Association.

BOSTON, Jan. 12.—*Editor Forest and Stream*: The Massachusetts Fish and Game Protective Association enters upon another year—the twenty-fifth—of its useful and profitable existence. For twenty-five years it has stood for the enactment of laws for the protection of fish and game, and their rigid enforcement. The scope of its usefulness has been enlarged from time to time, and it is today regarded as a powerful factor in behalf of wholesome and beneficent measures relating to fish and game. It has raised and expended large sums of money for restocking our natural covers with game birds suitable to our climate and surroundings, and it is still in good condition, and prepared to continue in the good work for which it was formed. It bears on its rolls of membership many genuine sportsmen—business and professional men who find their enjoyment in the fields and on the lakes and streams—men who have given freely of their time and means to promote the interests of fish and game protection, thereby fostering at the same time the public interest.

The annual meeting was held at the Copley Square Hotel on Wednesday evening, the 11th inst., and was largely attended. Previous to the general gathering, a meeting of the board of management was held, at which Vice-President B. C. Clark presided. Several matters of interest were informally discussed and referred to the new board for future action. At the association meeting Col. Horace T. Rockwell, the president, occupied the chair, and there were present ex-Presidents B. C. Clark, E. A. Samuels and George W. Wiggins; Ivers W. Adams, Dr. John T. Stetson, John N. Roberts, I. Q. A. Field, J. Russell Reed, Arthur W. Robinson, Dr. I. W. Bull, Dr. E. W. Branigan, Loring Crocker, Dr. A. R. Brown, A. C. Risteen, Robert S. Gray, Geo. O. Sears, Warren Hapgood, W. B. Hastings, Richard V. Joyce, Arthur I. Selfridge, E. E. Small, George Loring, C. J. H. Woodbury, A. S. Adams, Sumer A. Ganed, Charles C. Williams, Charles Stewart, Dr. George H. Payne, W. C. Woodward, Charles Butcher, Levi Kennison, C. A. Reed, N. L. Martin, Col. George L. Shepley, of Providence; C. M. Gallaup, Judge S. A. Bolster, C. A. Bamey, George M. Tufts, Joseph Guild and others. Several proposals for membership were referred to the appropriate committee, and a ballot resulted in the unanimous election of Dr. Maurice H. Richardson, Mr. Bliss Black and Mr. W. S. Hinman to membership. Mr. Kimball, the treasurer, presented his report, by which it appeared that the funds were in good condition, and that there was a balance on hand at the beginning of the year of \$231.70. The invested funds had grown somewhat during the year, and now amounted to \$2,635.70. The committee on ballot announced the election of the following officers for the ensuing year:

President, George W. Wiggins; Vice-Presidents, Horace T. Rockwell, Benjamin C. Clark, C. J. H. Woodbury, Robert S. Gray, James Russell Reed, Heber Bishop, E. A. Samuels; Secretary and Treasurer, Henry H. Kimball; Librarian, Dr. E. W. Branigan; Executive Committee, Dr. John T. Stetson, Charles Stewart, William B. Smart, Rollin Jones, Charles M. Bryant, George H. Payne, John N. Roberts, Charles G. Gibson, Dr. A. R. Brown, A. C. Risteen, Loring Crocker, E. E. Small; Membership Com-

mittee, Arthur W. Robinson, Thomas H. Hall, W. B. Hastings; Fund Committee, Warren Hapgood, Charles C. Williams, George O. Sears.

Col. Rockwell on retiring from the chair spoke of the good work done by the Association, for in spite of the cavil and criticisms that were formerly heard the Association had performed a great amount of work for the public good. His predecessors had been a long line of enthusiastic and honorable sportsmen, who had given of their time and money to further the objects of the Association, and he congratulated his fellow members upon the election of Mr. Wiggins, who had been in the position before, and who could always be counted upon for efficient work. Ex-Presidents Clark and Samuels conducted Mr. Wiggins to the chair, and that gentleman thanked the members for the confidence extended him. Up to the present moment he said he had hardly decided whether it was his duty to accept the burden laid upon him. He had been there before, and knew something of the duties of the position. It entails time and money and ceaseless activity, and so strong was his interest in the Association and its work that he felt it his duty to accept once more the presidency, and he promised his best efforts in its behalf. Since its organization not a year has gone by that it has not done good work before the Legislature to secure proper fish and game laws, and in various other ways has its influence been potent. We have always had our attorney ready and willing to bring cases of violation of the laws before the courts, and he has brought many such cases to a successful issue. In many instances, as is well known, it is exceedingly difficult to secure evidence against known violators of the law, but once give us the proper evidence and our attorney will push the cases to conviction. He closed by invoking the hearty co-operation of all the members as well as all the advocates of fish and game protection, as only in that way could successful results be obtained.

A vote of thanks was passed to Col. Rockwell for his two years' successful administration, and the Colonel briefly responded.

Col. Shepley, of Providence, gave an interesting talk upon tarpon fishing, premising his remarks by saying that so wonderful was that sport that it was almost impossible to lie about it. He then proceeded to give his experiences, some of which would have seemed to border on the miraculous had it not been for his disclaimer. Mr. Walter Selaman, of Newark, N. J., spoke interestingly of the boar, kangaroo and alligator hunting. Mr. W. S. Hinman told of seeing a bunch of partridges that were entirely innocent of shot marks hanging up in a market.

After the appointment of a committee to arrange for the annual dinner—always the swell affair of the Association—a very interesting and successful meeting was brought to a close.

WILLIAM B. SMART.

Spawning Grilse.

NEW YORK, Jan. 11.—Mr. Mowat's note on spawning grilse in this week's *FOREST AND STREAM* suggests the idea that his grilse may have been mature small salmon that have wandered into the Restigouche River from some smaller stream. In some of the streams of Newfoundland and Labrador, salmon seem to mature at less than 4lbs. weight. At first I took these fish for grilse, but on discovering that many of them contained well developed ova, a little close observation taught me to pick out the salmon readily by their mature general appearance. In some of the small Atlantic streams of the far north the majority of the salmon seem to be mature at from 3½ to 5lbs. weight, and I assume that they are fish that have adapted themselves to an environment. Breeding stations are not apt to be erected on streams containing small salmon only, and it is possible that an interesting chapter on small salmon remains to be written.

R. T. M.

Female Grilse.

OFFICE OF OFFICIAL REPORTERS OF DEBATES, House of Representatives, U. S., Washington, D. C., Jan. 12.—*Editor Forest and Stream*: Referring to the interesting letter of Mr. Alexander Mowat, on the subject of female grilse, I wish to say that in 1896, while fishing on the Little South-west Miramichi in New Brunswick with Mr. Henry Braithwaite, I killed a grilse weighing 3½lbs., which was in every respect, so far as eggs, etc., were concerned, a miniature female salmon. The eggs were about the size of those which are found in a 2lb. brook trout. Mr. Braithwaite, while cleaning the fish, called my attention to the fact. He said he had seen several female grilse, but that they were by no means common.

BENCH SHOWS.

Jan. 18.—Logansport, Ind.—North Central Indiana Poultry Association's bench show. Sol. D. Brandt, Sec'y.
Jan. 19-21.—New Orleans, La.—New Orleans Fox Terrier Club's show. Wm. Le Monnier, Sec'y.
Feb. 8-11.—Milwaukee, Wis.—Bench show for the benefit of the Wisconsin training school for nurses. E. J. Meisenheimer, Sec'y.
Feb. 21-24.—New York.—Westminster Kennel Club's twenty-third annual show. Jas. Mortimer, Sec'y and Supt.
March 7-10.—Grand Rapids, Mich.—Butterfly Association's bench show. Miss Grace H. Griswold, Sec'y.
March 14-17.—St. Louis, Mo.—St. Louis Kennel Club's show.
March 21-24.—Chicago.—Mascot Kennel Club's show.
April 4-7.—Boston, Mass.—New England Kennel Club's bench show. James Mortimer, Manager.
Nov. 22-24.—New York.—American Pet Dog Club's show. S. C. Hodge, Supt.

FIELD TRIALS.

Jan. 16.—Bakersfield, Cal.—Field trials of the Pacific Coast Field Trials Club. J. Kilgariff, Sec'y.
Jan. 16.—West Point, Miss.—U. S. F. T. C. winter trials. W. B. Stafford, Sec'y.
Jan. 23.—West Point, Miss.—Champion Field Trials Association's fourth annual trials.
Feb. 6.—Madison, Ala.—Alabama Field Trial Club's third annual trials. T. H. Spencer, Sec'y.

Dogs for Grizzlies.

BOSTON, Mass.—*Editor Forest and Stream*: Last September, while shooting in the Rocky Mountains, I

wounded two "silver tips" which I was unable to track in the thick timber and so lost.

During this same trip I constantly came upon the fresh tracks of mountain lions, but was unable to get a shot at this game.

As I am making arrangements now for another trip next fall, I write to ask if you can give me any information about getting a pair of well trained bear dogs, which can also be used for treeing mountain lions and tracking wounded game; also what such a pair of well trained dogs should cost. I care nothing about breed, but want only dogs experienced in such hunting.

During my trip last September I shot two grizzlies, but had I had a pair of good dogs I should have probably gotten five, as I had three other good shots offered me.

As I shall have no opportunity in giving a trial, it is quite necessary that I am put in communication with some reliable party who may have such a pair of dogs for sale. If you can help me in this matter I shall be greatly obliged.

J. H. K.

International Field Trial Cup.

Editor Forest and Stream:

I send you to-day a photograph of the very handsome cup donated to the club by Mr. Thomas Johnson, which has just arrived from Winnipeg. The cup was to go to the winner of the All-Age Stake at the late trials. Mr. Geo. Kime's English setter dog Noble Chieftain was the lucky dog, and he comes honestly by his good field qualities, being by Dash Antonia, out of a bitch by Old Mingo.

Your reporter omitted to mention of the cup in his report of the trials and also in his report of the annual meeting of the club, that Mr. Johnson had been unanimously elected an honorary member, in recognition of and as a slight return for his generous support of the club since its start in 1889.

WM. B. WELLS, Hon. Sec'y I. F. T. C.

Points and Flushes.

The twenty-third annual dog show of the Westminster Kennel Club, to be held in Madison Square Garden, New York, Feb. 21-24, promises to be in every way a success. Entries close Feb. 6. For premium lists, etc., apply to the Superintendent, Mr. James Mortimer, Room 812, Townsend Building, 1123 Broadway, New York.

The Poultry Gentleman's Poultry, Dog and Pet Stock Association was organized on Jan. 12, and it voted to hold a poultry dog and pet stock show Feb. 28 to March 2. Dr. Hacker was elected president and Judson S. Newing treasurer of the Association. The other officers chosen were: Poultry Department, Vice-President, George C. Salmon, of Port Dickinson, and Secretary and Superintendent, Nat. E. Luce. Kennel and Pet Stock Department, Vice-President, J. B. Hadsell, Jr.; Secretary and Superintendent, A. Perry Fish; Veterinarian, Dr. H. H. Tarr. Bench Committee, A. Perry Fish, Thomas B. Beaty, Fred. W. Smith, J. Hadsell, Jr., Samuel Hill, Dr. H. H. Tarr and Dr. W. H. Hacker.

ROXBURY, Mass., Jan. 16.—*Editor Forest and Stream*: At the annual meeting of the Brunswick Fur Club, held at Barre, Mass., on Jan. 9, the following officers were elected: O. T. Joslin, President; A. B. F. Kinney, Solomon Bennett, J. H. Van Dorn, Vice-Presidents; A. B. McGregor, M. F. H.; Bradford S. Turpin, Secretary; W. B. Stone, Treasurer; Dr. A. C. Heffenger, L. E. Conant, Geo. E. Carr, L. O. Dennison, Executive Committee; J. H. Van Dorn, Delegate to A. K. C.

BRADFORD S. TURPIN, Sec'y.

Canoeing.

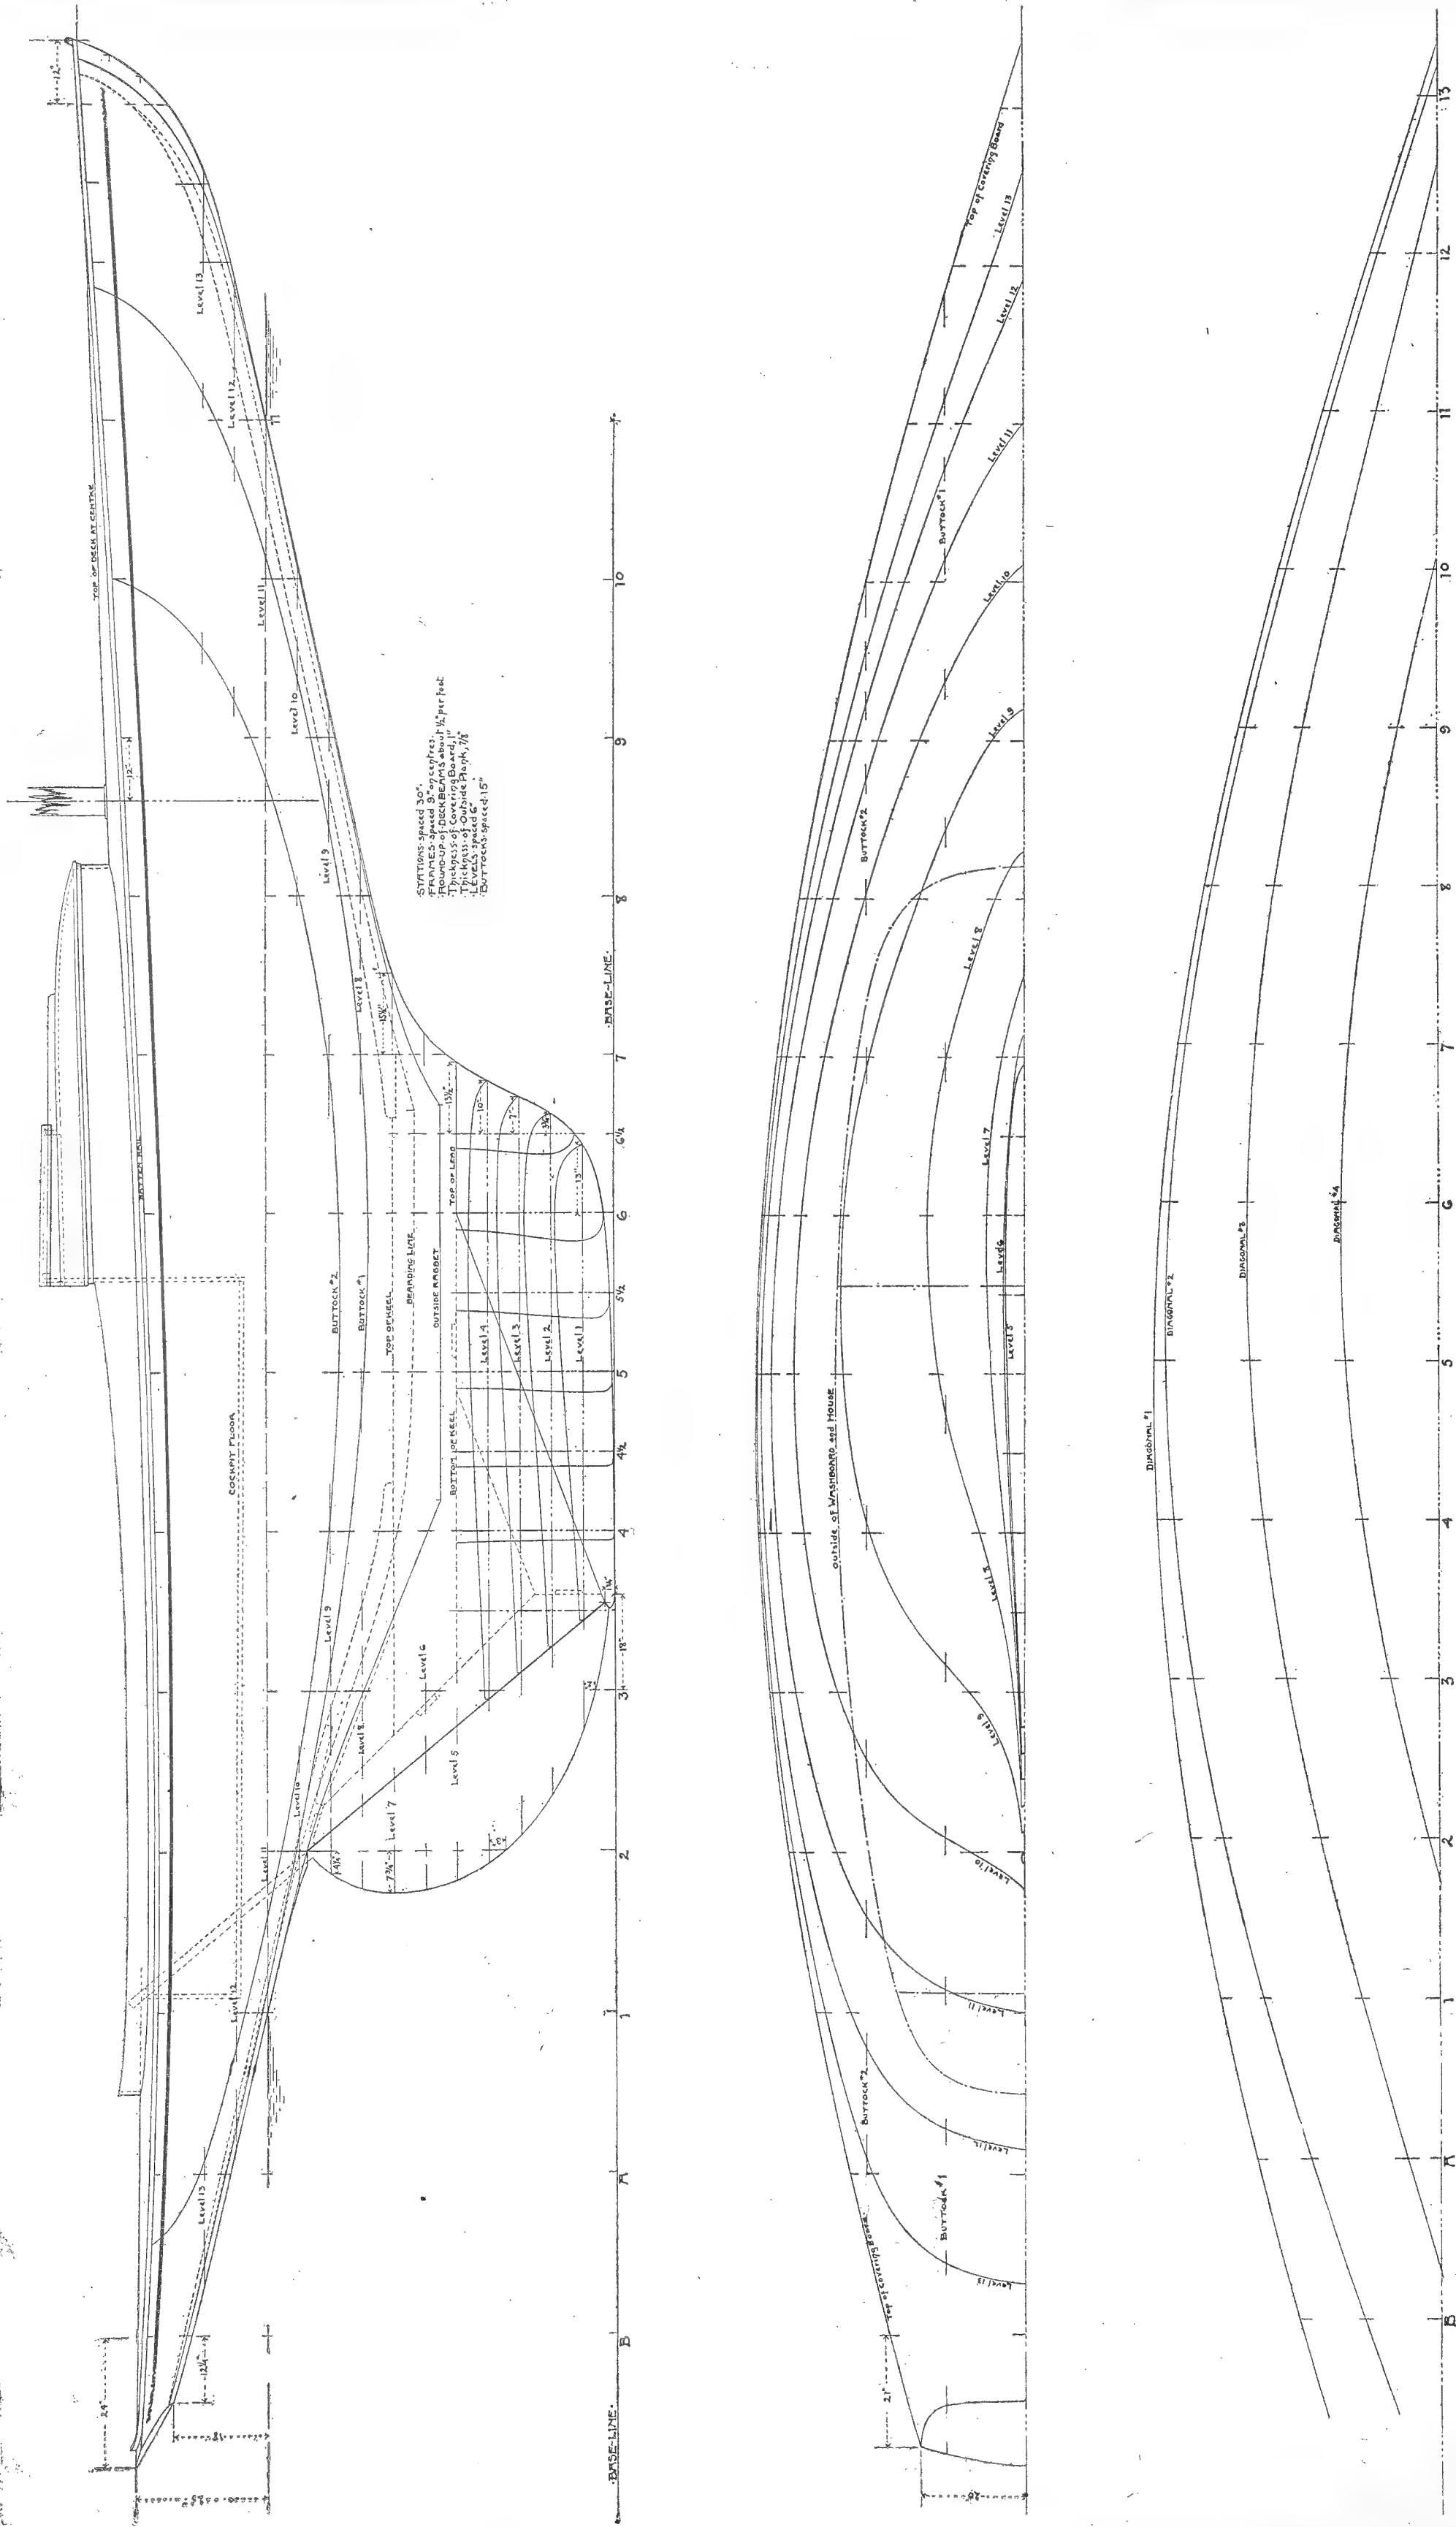

Fittings for Canoes and Small Craft.

THAT experienced cruiser, Mr. W. Baden-Powell, writes as follows in the *Field* concerning the fittings and appliances for small craft. It must be said that matters are in a better state on this side of the water within a few years past than ever before, and in some lines a very high degree of perfection has been reached. At the same time there are some necessary articles not easily obtained in the proper size and quality for the small cruiser.

Considering the enormous increase in the number of small yachts, sailing boats and canoes all over England in the last few years, it is really an astonishing thing to find that practically nothing has been done by tradesmen in the way of placing before the public, ready made, the necessary or useful metal fittings and other furniture specially adapted to small craft. For yachts and steam launches almost every bit of metal fitting required for hull or rigging can be purchased at the yacht store dealers at comparatively moderate prices, either in galvanized iron, copper, or brass. But for canoes and canoe-yawls almost the whole of the metal fittings, except common cleats, have to be hand made to drawings, and templates supplied by owner or builder to a local metal smith. The consequence is that such fittings cost about double the amount which would be asked if they were turned out wholesale and bought up by builders or even by owners.

Of course, in years gone by the answer to this was that the trade was so small as not to be worth the attention of manufacturers; but the fleet of small craft has quite changed since then, and at present the result is that, unless the expensive special fitting is adopted, the small raters, canoe-yawls and canoes are very commonly fitted up with metal work and fittings ridiculously large and heavy, and certainly not of the most convenient or modern pattern. Jaws for gaff or boom, made in brass and leather covered, should be procurable in various sizes and strengths; leather covered brass mast rings for lug hal-yards, with a neatly rounded eye wrought on, or a bent wire ring eye on the bight, with thimble, should be procurable in several sizes. Boxwood bullseyes stropped with brass bands for screwing to deck as fairleads for sheets, bullseyes stropped with screw-pin shackles, brass stropped boxwood blocks, masthead rigging collars, stem head fittings, and a host of other things should be purchasable ready made and of size exactly wanted in each class of

The members of the Horseshoe Harbor Club, of Larchmont, met at the Manhattan Hotel on Monday evening for their annual meeting, and elected officers for the ensuing year: Com., Albert C. Smith, Oconnee; Vice-Com., Frank E. Towle, Fairy; Sec'y, W. J. Merrill; Treas., Duncan Sterling, and Trustee, Eustis L. Hopkins. The reports of the various committees showed the club to be in excellent condition in all departments. Over forty members were present, among them being ex-Commodores Joseph H. Sterling and George S. Towle; Vice-Commo-

KEEL SLOOP OF 25FT. L.W.L.

Designed and built for Com. H. C. Rouse, Seawanhaka Cor. Y. C., by the Marblehead Yacht Yard, W. B. Stearns, 1899

SAIL PLAN OF 25FT. KEEL SLOOP.

dores Howard L. Curry and E. G. Unitt; Measurer Frank E. Towle, Jr., Captains Bird, Price, Scott, Barretto, Haigh, Pinckney, Ackerman, Griffen, Camp and others. Ex-Secretary C. S. Gaubert presented a magnificent silver cup for the racing of 1899.

The Union des Yachts Francais has given notice that at the request of the technical commission the council has

decided that those foreign clubs giving their regattas under the measurement and rules of 1892 may, on request, be represented in the congress of 1899 by one of their members, who will have the right to vote.

A Fast 25-footer.

THE accompanying design was made by the Marblehead Yacht Yard, W. B. Stearns, for Com. H. C. Rouse, Seawanhaka Corinthian Y. C., and two yachts are now building from it at the yard for Com. Rouse and a friend. They are intended for day sailing on open water, with some cabin accommodation, though not such as would be required for cruising. The order in a general way called for a keel boat of not over 5ft. 6in. draft, with knock-about rig of small area, large cockpit, small cabin house, strong and durable construction, and handsome finish. The boats were expected to be fast for the type, and easy in a sea. The dimensions finally chosen by the builder were:

Length over all	38ft.
L.W.L.	25ft.
Beam, extreme	8ft. 6in.
Beam, L.W.L.	8ft.
Draft	5ft. 6in.
Least freeboard	1ft. 9in.
Displacement	10,000lbs.
Ballast	5,000lbs.
Sail area	730 sq. ft.

The plans speak for themselves, and give every indication of realizing the expectations of designer and owners. The hull is planked with hard pine in single lengths, all copper fastened, the lead keel is slightly bulbed, and is fastened with Tobin bronze bolts, the plank-sheer and deck joiner work are of mahogany, the deck is of white pine,

and the cabin is finished in mahogany and butternut. Com. Rouse is the owner of the one-design Seawanhaka knock-about Mistral, designed and built by Mr. Stearns last year.

Rifle Range and Gallery.

Cincinnati Rifle Association.

THE following scores were made in regular competition by members of the Cincinnati Rifle Association, Jan. 8, at Four-Mile House, Reading Road. Conditions: 200yds., off-hand, at the German ring target. Gindele was declared champion with a score of 226 on that target. Payne was high with 66 on the honor target. Gindele was high with 231 for the Uckotter trophy. A strong, gusty wind prevailed throughout the day, making the shooting difficult.

Champion target:		Honor target:		Special Scores.	
Gindele	23 19 24 22 24 21 22 24 23 24—226	24 16 15—55	231	224	216
Payne	21 22 13 22 20 21 22 20 16 20—197	22 22 22—66	223	213	204

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Rifle at Shell Mound.

SAN FRANCISCO, Jan. 9.—A pleasant day greeted the marksmen who assembled at Shell Mound yesterday to inaugurate the year's shooting programmes. The following organizations held contests: The Naval Militia, Independent Rifles, Germania Schuetzen Club, German Krieger Verein, Columbia Pistol and Rifle Club and the Norddeutscher Schuetzen Club.

Aside from the ordinary medals and prizes, the Germania Schuetzen Club announced the following premiums for public competition matches, to be contested every second and fourth Sunday of each month: \$420 divided in prizes, tapering from \$100 down to \$8, for the best ten scores on the ring target and the best five centers during the year, and the Bushnell medal for the championship of the Pacific Coast.

The Columbia Pistol and Rifle Club offers class medals for members, experts, sharpshooters and marksmen, to be contested for on the second Sunday of each month. Re-entry matches, Glindeman medal, for all comers; military and repeating rifle medal; Siebe all-comers' pistol medal, for 50yd. range, off-hand; Lewis' all-comers' revolver trophy; Daiss' all-comers' .22 and .25cal. rifle medal, with Jacobson's medal for members added; diploma for best two scores on rifle, pistol, military revolver, .22 and .25cal.

The following scores were recorded at yesterday's contests of the various clubs:

Columbia Pistol and Rifle Club—Ten-shot scores, pistol range, 50 ds., Columbia target; Daiss and Jacobson medal, .22 and .25cal. rifle: F. O. Young 29; George Mannell 35, 41. Siebe pistol medal—F. O. Young 44, 56; G. M. Barley 52. Class medals—J. E. Gorman 46, G. M. Barley 53, M. J. White 60, F. O. Young 59, J. P. Cosgrave 79, Mrs. M. J. White 65, J. J. Fitzpatrick 138. Rifle class medals—Dr. Rodgers 69, E. Jacobson 78, F. O. Young 79, M. J. White 87, G. M. Barley 128, J. J. Fitzpatrick 152, Mrs. M. J. White 158. Glindeman all-comers' rifle medal—F. O. Young 44, 52, E. Jacobson 60, E. N. Moor 88, G. Mannell 89.

Germania Schuetzen Club, monthly medal shoot—First champion class, Dr. L. Rodgers 434; second champion class, Nick Ahrens 415; first class, John Gefken 388; second class, E. H. Goetze 375; third class, H. Likendey 342; best first shot, August Jungblut, 25; last best shot, Dr. L. Rodgers, 24. Yearly competition shoot for Bushnell medal, highest scores—F. P. Schuster 220, Dr. L. Rodgers 216, A. Strecker 215. Yearly competition for cash prizes, highest scores—Dr. L. Rodgers 72, J. Utschig 71, A. Strecker 70, J. D. Heise 69, E. H. Goetze 68, F. P. Schuster 67, William Goetze 67.

German Krieger Verein Schuetzen Section, monthly bullseye and medal shoot—Champion class, Oscar Dammer 365; first class, Fritz Kaiser 352; second class, John Bender 346; third class, Charles Meyer 298; best first shot, George Hetzel, 21; best last shot, F. Kaiser, 23; most bullseyes, O. Dammer. Bullseye shoot—F. Kaiser 743, O. Dammer 1232, Charles Meyer 1542, John Bender 1619, Charles Weggeman 1751.

San Francisco Schuetzen Verein, monthly medal shoot—Champion, first and second classes, not filled; third class, E. H. Goetze 391; fourth class, John Beuttler 382; best first shot, Gustav Schulz, 23; best last shot, E. Stettin, 25.

ROEEL.

Mr. James Conlin, famous as an instructor in the art of rifle and pistol shooting, has been established some weeks in his old quarters, Thirty-first Street and Broadway, New York, where the famous FOREST AND STREAM and other matches were contested. He contemplates holding an international rifle tournament in the week in which the sportsmen's show is held. His gallery is most perfectly equipped with fine rifles and pistols; and numerous targets, authentic beyond doubt and marvelous in their record of accuracy, hang on the walls. Mr. Conlin intends to run his gallery on the same high plane as in the past, and make it again famous for its skillful contests.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

Jan. 18.—Reading, Pa.—The Reading handicap; open to all, \$10 entrance, \$150 guaranteed. Arthur A. Fink, Manager.
Jan. 18.—Stony Creek, Pa.—Stony Creek handicap, 25 live birds. A. A. Fink, Manager, 426 Franklin St., Reading, Pa.
Jan. 21.—Holmesburg Junction.—Fulford-Heikes contest for E C cup at 1:30 P. M., on grounds of the Keystone Shooting League, Holmesburg Junction, on Pennsylvania R. R.
Jan. 25.—Singac, N. J.—Twenty-five live-bird handicap, \$10 entrance, birds extra. Arthur Bunn, Manager.
Jan. 28.—Brooklyn, L. I.—Brooklyn Gun Club's monthly shoot at targets. John Wright, Manager.
Feb. 13.—Pawling, N. Y.—Tournament of the Pawling Rod and Gun Club; targets. Geo. S. Williams, Sec'y.
Feb. 14.—Lyndhurst, N. J.—Tournament of the Lyndhurst Shooting Association. Main event, Money vs. Morley, for the E. C. cup and championship of New Jersey. T. W. Morley, Sec'y.
Feb. 22.—Altoona, Pa.—Target tournament of the Altoona Rod and Gun Club. G. G. Zeth, Sec'y.
Feb. 22.—New Haven, Conn.—New Haven Gun Club's tournament; \$20 added money. J. B. Savage, Sec'y.
Feb. 22.—Worcester, Mass.—Tournament of the Worcester Sportsmen's Club; targets. A. W. Walls, Sec'y.
Feb. —Lyndhurst, N. J.—Live-bird tournament of the Brooklyn Gun Club. John Wright, Manager.
March 1.—White Plains, N. Y.—Fifteen live-bird handicap, \$10 entrance, birds included. E. G. Horton, Manager, White Plains.
April 6-8.—Utica, N. Y.—Fulford's handicap at live birds. E. D. Fulford, Manager.
April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament.
April 18-20.—Lincoln, Neb.—The Lincoln Gun Club's second annual interstate tournament; targets and live birds; \$500 added. Geo. L. Carter, Sec'y.
April 18-21.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.
April 25-28.—Baltimore, Md.—Tournament of Baltimore Shooting Association; targets and live birds; money added. Geo. L. Harrison, Sec'y.
May 16-19.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.
May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.
May 24-25.—Greenwood, S. C.—Annual live-bird tournament of the Greenwood Gun Club; 25-bird Southern Handicap. R. G. McCants, Sec'y.
June 7-9.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. T. C. Porterfield, Sec'y, O. T. S. L.
June 7.—Buffalo, N. Y.—New York State shoot, under auspices of the Buffalo Audubon Gun Club, Chas. H. Bamberg, Sec'y.
June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.
June 20-22.—Sistersville, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. John B. Garden, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties on all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The Brooklyn Gun Club's monthly shoot takes place on Jan. 28. Visitors are welcome. John Wright is manager.

The Pawling Rod and Gun Club will hold a shooting tournament on Lincoln's birthday, Feb. 13, at Pawling, N. Y., on the grounds of the club. There will be twelve events at targets: three at 10 targets, \$1.20 entrance; four at 15 targets, \$1.30 entrance; three at 20, \$1.40 entrance; one at 10 pairs, \$1.40 entrance. One 20-target event will be an allowance handicap, with merchandise prizes added. Experts will be barred from one 10-target and one 15-target event. Total entrance fee, \$15.60. Shooting begins at 9 o'clock A. M. sharp. Sergeant system, electric pull. American Association rules. Purses, four moneys if twelve entries or over; under twelve, three moneys. Lunch served in the club house. Stages run to and from grounds. Special rates at the Dutch House. Extra events will be arranged if time permits. Pawling is ninety miles from New York, on the Harlem Railroad. Geo. S. Williams, Secretary.

The programme of the Altoona Rod and Gun Club's tournament, to be held on their grounds, near Lyswen, Altoona, Pa., Feb. 22, provides ten events at targets. Six are at 10 targets, \$1 entrance; one at 15, \$1.50; one at 20, \$2; one at 25 (the handicap medal event), entrance \$2.50; and one at 5 pairs, \$1. All events will be at unknown angles. A good lunch will be served in the club house dining room. Guns and shells shipped in care of the secretary will be delivered on the grounds free. Purses will be divided according to the Jack Rabbit system, surplus, 50, 30 and 20 per cent. The grounds are easily reached by electric cars, which run from the center of the city every fifteen minutes. The programme contains a list of hotels, to which the management refers visitors. G. G. Zeth, secretary, Altoona, Pa.

Notwithstanding that Capt. Money has not fully recovered his strength, since his recent severe illness, he was one of the shooters who shot through the whole programme at John Wright's invitation shoot, Jan. 10. For a man who is sixty years old, he is a wonder of vigor and skill, though high as they are they are excluded by his deserved popularity. His score of 97 to Guthrie's 96 out of 100 at Carteret, Nov. 29, is, so far as we know, a record-breaker for all shooters of his age. Indeed, in the matter of skill, endurance and vivacity, the matter of age is of no moment with the popular shooter in question.

The regular annual meeting of the Erie Rod and Gun Club was held on Jan. 11. Officers were elected as follows: President, Frederick Graef; Vice-President and Treasurer, Charles Plate; Secretary, Charles H. Lührssen; Handicapping Committee for the Year, Henry Dohrmann and Charles Plate. The following yearly prize winners were announced: First prize, Class AA, Charles M. Murphy; second prize, Class A, Frederick Graef and Harry Blackley, a tie; it will be shot off later in the season; third prize, Class B, George Fuchs; prizes for best attendance at regular shoots were awarded to George Fuchs and Charles Dettelfsen.

Dominie Beveridge, at present rusticated in Fremont, Neb., says that the best bait for wild geese is the left hindleg of a newly killed rabbit of the plains. Armed with a gun and a rabbit's foot of the above description, together with a few suitable loads for geese, he left his residence early one morning, dug a hole deep enough to conceal him (no easy task, by the way), and scored four straight on geese before breakfast. He further states that four geese, averaging between 13 and 15lbs. each, is as much as one healthy man ought to carry home at any time, whether before or after breakfast.

The Altoona, Pa., Rod and Gun Club held an annual meeting at its club house, near the city, on Monday evening, Jan. 9. The following officers were elected for the ensuing year: President, G. T. Bell; Vice-President, R. A. McNaught; Treasurer, R. H. Fay; Secretary, G. G. Zeth; Captain, J. F. Killits; Executive Committee: Ed Kottmann and W. E. Bell. The club is arranging for a number of shoots for the coming season, and its events will no doubt figure among the prominent ones.

The shoot held last week under the auspices of the Brooklyn, N. Y., Gun Club, was such a success that Manager John S. Wright has determined to run another on similar lines. The next effort will be held toward the close of next month, and will be brought off on the grounds of the Lyndhurst Shooting Association, at Lyndhurst, N. J., which grounds are under the direct control of T. W. Morley, the well-known live-bird shot, and at present, the champion target shot of the State of New Jersey.

Mr. J. S. Newell, lately connected with the Selby Smelting & Lead Company, of San Francisco, Cal., but now manager of the U. S. Smokeless Powder Company, of the same city, is visiting New York and Eastern points on a business trip. Mr. Newell has been visible on "Sporting Goods Row" for the past few days, and has so far found the weather far from suitable for one so long connected with the delightful climate of the Pacific Slope.

Mr. Rolla O. Heikes made a visit to the Remington factory at Ilion, N. Y., making his headquarters in Utica, the home of Mr. E. Fulford, and received a pleasant visit from the latter. Ilion is only twelve miles from Utica, and is reached easily by train. Mr. Heikes now has his new Remington, a gun of excellent balance and design, and in the hands of the Daddy of them All is likely to be an active factor in future shooting history.

Tuesday of this week, Jan. 17, was the date set for a large sweepstake shoot at the Carteret traps, Garden City, L. I. The conditions were: 50 live birds per man, \$50 entrance. The outlook on Monday was for an entry list approaching the teens, as shooters from Riverton, the Herron Hill Gun Club, of Pittsburg, Pa., and from other crack clubs around New York, had all signified their intention of taking part in the sweep.

Mr. Will K. Park, trap editor of Sporting Life, has entirely recovered from his recent severe illness, and is hustling about again in his old-time way. He is breaking targets much after the manner of a shooter who knows how to shoot. His most recent performance is the winning of the Florists' Gun Club shoot at Wissinoming, Jan. 10, by a score of 42 out of 50, half known, half unknown angles.

Under the able management of John Wright, the Brooklyn Gun Club will give another live-bird shoot in February. John is seriously thinking of engaging a clover leaf grounds for his friends to shoot on, to the end that he will have room for all to enjoy themselves, but he will probably secure some location near New York. John Wright's invitation shoot last week came nearer to being a tournament than many more pretentious shooting affairs.

Last Saturday was a squelcher on trap-shooting. Rainy, foggy, somber and forbidding, it chilled the ardor of the most enthusiastic shooters. Owing to it, the match of Messrs. Banks and Fanning vs. Messrs. Heikes and Halliwell was postponed. The regular club shoots also were sufferers from it. We need rain frequently, but it will do quite as well on any other day.

Capt. Money has just won another match, and with a score that shows that the attack of pleurisy from which he has lately recovered has not injured the working together of his hand and eye. On Saturday afternoon last, Jan. 14, despite rain and fog, he shot a 100-bird race with Leonard Finletter, of Philadelphia, Pa., defeating him by 2 birds, scoring 93 to 91.

Mr. C. C. Beveridge, known to his host of shooting friends by the endearing sobriquet Dominie, is now in Fremont, Neb. Later in the month he contemplates taking a week's quail shooting. He is missed about New York in the club shoots, and there is a gap in the friendly circle due to his absence. May he soon speed eastward.

Charlie Young has gone back to his home in Springfield, O. While here Mr. Young had something very fine in the gun line on exhibition. He showed it to certain parties in the city, and it is understood that he returned to the Buckeye State more than satisfied with the results obtained from his brief visit to about the only city on earth.

Under date of Jan. 12 Mr. Elmer E. Shaner, manager of the Interstate Association, writes us as follows: "Programmes for the Grand American Handicap tournament will be ready for distribution March 1. Entries for the Grand American Handicap will be received at our New York office, Edward Banks, secretary-treasurer, 318 Broadway, New York city."

The officers of the Jeanette Gun Club of New York for 1899 are: President, Fred Ehlen; Vice-President, Fred Carstens; Secretary, W. P. Rottman; Treasurer, J. Nick Brunie. The two latter were re-elected. Shooting Committee and Handicappers: Louis H. Schortemeier, chairman; J. Nick Brunie and Chas. Heilshorn.

There will be a 25-live-bird handicap at Singac, N. J., on Jan. 25. Entrance \$10, birds extra, handicaps from 24 to 32yds. Trains leave Chambers street at 10:30 and 12 o'clock for Little Falls. Take the electric cars from the Erie Depot at Paterson to Singac. Extra events will be shot. Arthur Bunn, manager.

The Mauser rifles were a formidable auxiliary to the period of putting, in which Spain indulged in, in the year now gone. We learn that Messrs. Schoverling, Daly & Gales, have secured a lot of the Mauser rifles which were used in the late war, and will retail them for the low sum of \$7.50.

W. L. Colville (Dick Swiveller), of Batavia, N. Y., has resigned his position as Eastern Manager for the U. S. Smokeless Powder Company, and has now joined the ranks of those who represent the smokeless powder interests of the firm of E. I. du Pont de Nemours & Co., of Wilmington, Del.

Mr. E. G. Horton, 100 Railroad avenue, White Plains, N. Y., informs us that on Wednesday, March 1, he will manage a live-bird shoot, a handicap, 32 to 25yds., \$10 entrance, birds included, money divided 40, 30, 20 and 10 per cent. The shoot will be held at Molenaar, Sunnyside Kennels, White Plains.

BERNARD WATERS.

Buffalo Audubon Gun Club.

BUFFALO, N. Y., Jan. 12.—The match between Messrs. E. C. Burkhardt and J. C. Roberts, shot at Audubon Park to-day, resulted in a victory for the former by a score of 46 to 42. It was very closely contested up to the last 3 birds. Burkhardt shot 3½drs. Hazard smokeless in U. M. C. factory-loaded shells. The scores:

J. C. Roberts.....202201*211211102122111121—21
E. C. Burkhardt.....11102211212111112122*0—21—42
1*21222222222221*1122102—22
121222122*21111111212212—24—46

Seven birds: E. C. Burkhardt 6, J. C. Roberts 7, C. E. H. 7, Douglass 7, Robinson 7, Russell 7, Crooks 5, Johnson 6.

Five birds: E. C. Burkhardt 5, J. C. Roberts 4, C. E. H. 4, Douglass 5, Robinson 4, Russell 3, Johnson 3.

Jan. 13.—The contest for the Clinton Bidwell trophy between Messrs. E. C. Burkhardt and F. G. Wheeler took place to-day on the grounds of the Bison Gun Club. The contest was at 25 live birds, and was very close. Wheeler lost 2 dead out of bounds. Mr. Charles Werlin immediately challenged the winner to contest for the trophy, and the challenge was accepted. The date will be fixed upon later. The scores:

E. C. Burkhardt.....1212212222122212221222—24
F. G. Wheeler.....2122121112*1120121*12112—22

Sweepstakes followed. No. 1 was at 5 live birds, the remainder at 10 targets:

Barker	13		13	13									39	.866
Bottom		9			7								25	.555
Frankie		11		12									23	.706

And don't forget that the Missouri Amateur Sportsmen's Association tournament will be held next summer under the auspices of the Washington Park Gun Club, with at least \$350. added.

Fremont Gun Club.

FREMONT, Neb., Jan. 13.—We had a heavy cross-wind, that made it hard shooting. The 10-target events were 50 cents; the 15-target, 75 cents. We are to have a live-bird shoot on Feb. 22. Give my regards to all the boys, and tell them I will see them later. I expect to leave here the 17th for Oklahoma for a week's quail shoot. Expect a good time.

Confabulations of the Cadi.—XV.

GLORIOUS weather favored the opening day of the Egyptian Gun Club's tournament. It was decided after many fears and misgivings that it would be a two-day affair; one at targets, one at live birds. All the other preliminaries were concluded, each of which represented many timorous forebodings as to its success from some one or two or more of the members; for there were several members who were quite convinced that a certain arrangement was entirely wrong, and therefore portended disaster, while there were other members who were equally convinced that certain other arrangements were the only ones which were hopelessly ruinous to the tournament's success and therefore ruinous to the Club's interests; others again were enthusiastic over all the arrangements and maintained that the tournament had within it all the essentials of success, and that therefore all the calamity howlers were wrong. At the worst, they held that if there were some matters of minor detail which were not quite right, there were enough which were right and which would save the day.

The members who had had the least experience in tournament matters, and who were commonplace people in commonplace matters in everyday life, were the most opinionated and assertive in proposing what should and what should not be done, and in prophesying disaster if their advice was unheeded. In this there was nothing particularly strange, for there is many a man who cannot manage his own farm and family who feels nevertheless that he is competent to manage the affairs of the nation.

Still as the tournament affairs drifted from the realm of talk to the realm of action, and the members were therefore necessarily at more and more remote distances from the cider bucket, the zeal of several seemed to lessen till in time all the work devolved on the Cadi and Moke, much to the concern of their respective wives. The concern of each, however, sprang from widely different feelings. Hopie Jane, as became a good wife who had such a treasure of a husband, was profoundly grieved over the Cadi's exertions in the club's behalf, which seemed all the more dangerous since they were beyond anything that he ever attempted at home; and it was very dangerous for him to work at home, as his wife knew from the many assurances and the sudden illnesses on the part of the good Cadi when he thought that there was work at hand or in prospect. In his weak state, the over-exertion might irreparably injure his health, or he even might die, and then she would have no husband to work for, to say nothing of the passing away of the divinest man of earth. The wife of Moke was grieved over the fact that, by his engaging in club matters exclusively, she had no husband to work for her, the point of view of the one being that she loved her husband first of all; that of the other, that she loved herself, and was deprived of the luxury of bacon and cornbread, to which she had been accustomed all her life before her marriage, and to which she called the attention of Moke from one to fifty times every day.

However, once the spirit of the sport was on the Cadi, he could not, from pure love of it, refrain from engaging in the work pertaining to the tournament. In matters of work on his own farm he was spiritless, weary and inactive; in matters of sport he was the opposite in every respect—something after the manner of the parson's old horse, so graphically described by Oliver Wendell Holmes:

"Sportsmen and jockeys knew him not;
And yet they say he once could trot
Among the fleetest of the town,
Till something cracked and broke down—
'And are we then so soon forgot?'
Ah, me! I doubt if one of you
Has ever heard the name Old Blue,
Whose fame through all this region rung
In those old days when I was young."

He was simply the good parson's family horse, sedate and deliberate from many years of steady going, and

"Scant-manned, sharp-backed, and shaky-kneed,
The wreck of what was once a steed—
Lips thin, eyes hollow, stiff in joints;
Yet not without his knowing points."

One day when, by fortuitous circumstances, the deacon who had borrowed him entered him in a race against the crackerjacks, liberate from years of steady going, and

"Long ere the quarter was a half,
The chuckling crowd had ceased to laugh;
Tighter the frightened jockey clung
As in a mighty stride he swung,
The gravel flying in his track,
His neck stretched out, his ears laid back.
His tail extended all the while
Behind him like a rat-tail file.
Off went a shoe—away it spun,
Shot like a bullet from a gun;
The quacking jockey shapes a prayer
From scraps of oath he used to swear;
He drops his whip, he drops his rein,
He clutches fiercely for the mane;
He'll lose his hold—he sways and reels—
He'll slide beneath those trampling heels!
The knees of many a horseman quake—
The flowers on many a bonnet shake,
And shouts arise from left to right,
'Stick out! stick out!' Hould tight! hould tight!
'Cling 'round his neck and don't let go—
That pace can't hold—there, steady, whoa!
But like the sable steed that bore
The spectral lover of Lenore,
His nostrils snorting foam and fire,
No stretch his bony limbs can tire;
And now the stand he rushes by,
And 'Stop him! stop him!' is the cry.
'Stand back! he's only just begun—
He's having out three heats in one.'"

* * * * *
"Moral for which this tale is told:
A horse can trot for all he's old."

The old horse in a race and the old horse in everyday life were quite different animals. Either he should have been named Cadi, or else the Cadi should have been named Old Blue. In spirit they were alike.

The Tournament.

Some of the shooters from a distance had arrived the night before, to the end that they might be in good season for the commencement, and also to avoid the fatigues incident to long

travel in the morning. Some of the shooters had their shoes well blacked, others had them well greased, each being governed by the customs which obtained in his own bailiwick. In the matter of adornment tastes justly vary. Some wore their best clothes, others their worst, while others again wore the only clothes they had. There were shooting suits, semi-shooting suits, and suits which suited their wearers, and yet would have to pass as being unclassified.

There were a number of venerable men among the spectators who cared little for the spectacle of men at work, but who dearly enjoyed seeing men at play. They loudly descanted on the superiority of the sport fifty years ago, the wonderful men who then were masters with the gun, and they deplored the degeneracy of the present age, thereby proving beyond question that if they were no is-ers they had been great was-ers. Still it is strange that the was-er does not realize that he is the creature of arrested development, and that the world has moved on and left him in a past age, though he may be vegetating in the present.

The younger brethren were in an ecstasy of delight, and each one silently vowed that he would buy a good gun for \$500 as soon as he could raise it, and become one of the great shots of the earth.

The novice could readily be distinguished from the regular. The former was nervous and ill at ease; the latter was methodical, calm and quietly alert. He noted the appearance of the newcomers, carefully looked over the grounds to determine their effect on the flight of the targets, etc. There were cordial greetings, handshakes, chaffing, recountals of the doings at the last tournament, discussions on the best loads for target breaking, introductions, etc.

The novices in most instances had leaned their guns against the wall, where they would be nicely in the way of the shooters as they walked about. Cautioned about it, they moved them to a place which was unoccupied for the moment, but which a few minutes later was filled most unceremoniously with heavy boxes of shells, much to the alarm of the owners of the guns, who then placed them where they should have been placed at first—in the rack. The regulars were unperturbed. The novices took up their guns betimes and aimed them very impressively into the atmosphere, and furtively scanned the guns of the regulars to perceive wherein was hidden magic which enabled them to break so many targets or to kill so many birds. The regulars in most instances entered for the whole day's programme, and this with the nonchalance of men who had money to burn. The novices in most instances entered in one event at a time, passing in their money with visible reluctance and looking after it with a pained look; longingly, as after a friend who was starting on a visit to a far country for a long while.

The morning hour had not passed before programmes were lying about on the ground by the dozen, and there were several bundles of them in the club house unopened. They remained unopened throughout the tournament. There were enough without them. Still, it might have been a matter of interest to the advertisers, and set them thinking that there is sometimes a difference between the promises set forth in the circular letter soliciting advertising and what is done actually to fulfill the promises.

The Cadi and Moke were on hand early, receiving the shooters and endeavoring to answer a dozen questions all at once in respect to matters which were fully explained in the programme. They expected to have had ample assistance. Three of the members had promised to be on hand without fail. One sent word that his mule had a bad case of colic, and that it would be impossible for him to attend, and that he felt sorry. Another found that he could not neglect some important business matters which had unexpectedly required his attention. The third sent neither explanation nor excuse.

A sixteen-year-old boy, who was burning with curiosity to see and hear everything that was going on, was engaged to do the scoring, and thereafter he gave the strictest attention to everything but the business that he was engaged to attend.

The Cadi concluded that he would act as cashier, while Moke was to act as referee and squad hustler. Some of the regulars amiably volunteered to assist at such times as there was need of them, and their offer was gratefully accepted. The first shooter offered a \$50 bill to the Cadi, to pay for the day's entrance, and the latter was at a standstill at the start, for he had not a cent of change either in his own right or that of the club. There was then running from this man and that to make the needed change, for it is one of the first principles of a cashier at a tournament that once he gets money in hand it is wise to hold it if it can be held.

As there was no organized force in the beginning, and no definite plan of action at any time, there was no head nor tail to the management of the tournament, and everything was in a state of chaos from start to finish.

As to the conduct of the shooting after it began it will be dwelt upon at another time.

BERNARD WATERS.

Boston Gun Club.

WELLINGTON, Mass., Jan. 11.—Zero temperature attended the Boston Gun Club's fourth prize shoot, together with a half-dozen enthusiasts that nothing short of an earthquake would prevent coming out. A clearer day could not possibly be asked, and with a huge fire burning cheerily in the wood-stove there were worse places a good deal than Wellington. At least this was the decision reached after the shooters had sampled the conditions and found them satisfactory, for good scoring was done before darkness closed in, as the accompanying scores will show.

Mr. G. O. Henderson, a visitor from Hingham, broke 56 single targets without a miss. Some doubles shot in between lowered his average, but latterly his handicap distance on this style of shooting was more correctly gauged. His match score of 20 was a splendid one, considering it marked his debut on these particular grounds. Mr. Gordon was a close second, and also with straight, having three to Henderson's five.

ON LONG ISLAND.

Oceanic Gun Club.

Jan. 16.—The Oceanic Gun Club held its first shoot at Rockaway Park, on the grounds where the Rockaway Park Rod and Gun Club held so many interesting shoots. The weather was pleasant and enjoyable. A stiff breeze made the targets fly in a most puzzling manner. There was quite a good attendance and shooting progressed steadily.

The officers of the Oceanic Gun Club are: President, Frank Coleman; Secretary-Treasurer, John H. W. Fleming; Captain, L. H. Schortemeier. The next shoot will be held in the latter part of this month.

Several Star sweeps were shot, which do not figure in the scores, owing to most of the shooters having an unequal number of birds to shoot at. They were shot after the following manner: Each shooter puts in, let us say, 5 cents at the start. Then each shoots at 6 targets, and for every miss each shooter puts 5 cents; thus if a shooter missed his 6 targets, he would contribute 35 cents to the purse. If he missed none, then he would contribute only the 5 cents. The better a shooter performs under this system the less he puts in and the more he takes out. There were a number of these interesting events. The regular sweeps were for a nominal sum.

A most appetizing lunch, served free by the club, and appetites sharp-set by the salt sea air, were features which alone compensated for the pleasant trip had there been no other recreation.

Events:	1	2	3	4	5	6	7	8

New Utrecht Gun Club.

Woodlawn, L. I., Jan. 14.—No. 1 was the club shoot; No. 2 was the 500-shell shoot, 3 birds, then miss-and-out; Nos. 3, 4 and 5 were 5-bird sweeps.

Good birds, and fog and smoke—what there was of it—made second-barrel shooting very difficult at Woodlawn this afternoon at the bi-monthly live-bird shoot of the New Utrecht Gun Club. Some of Thompson's seconds were of the phenomenal. Clay birds next Saturday.

E. G. Frost, Sec'y.

Brooklyn Gun Club.

Jan. 10.—The live-bird invitation shoot of the Brooklyn Gun Club, under John Wright's management, was an unbounded success. There were shooters of all degrees, and so many of them that all could not shoot all they wished to, and darkness did not deter those who were in the last event.

From the invitation, which was on fine, tinted paper, with the club's monogram at the head, to the closing of the shoot, John Wright could feel that his shoot was a success. Messrs. Jacob Pentz and A. Knox did the referee duties, while Mr. J. H. W. Fleming did the scoring. John D. Regan was cashier. The handicappers were Messrs. Pentz and Hobart.

The weather was exceedingly cold. It was good weather for the birds to fly at their best, as there was a stiff north wind blowing from left to right across the traps. Among those present were shooters of national fame. There were Capt. A. W. Money, a giant with the gun; Jack Fanning, who has something over 90 per cent. on live birds and targets during the past season; Harvey McMurchy, who shoots up to a standard with the highest when he does shoot; J. J. U. M. C. Hallowell, who also is in the first rank; Charles Young, also a phenomenally good shot; E. Rike, a solid shot and a good one; Tom Morfe, well known as a formidable competitor with the best, and a number of others of as great enthusiasm, but less skill.

Miss Annie Oakley shot in some of the events, and displayed a degree of skill in no way inferior to the best.

The first event was at 5 live birds, \$3 entrance, birds extra, three moneys; all stood at 28yds. American Association rules governed. The scores:

Harrison	22122—5	Weldon	11122—5
Morfe	22222—5	Hallowell	21222—5
Marshall	12020—3	Remsen	21202—4
Douglas	22*21—4	Sands	22222—5
Young	22222—5	Short	2*212—4
Harding	00210—2	Doty	22222—5
Rike	01222—4	Waters	2211*—4
McMurchy	11122—5	Capt Money	12220—4
Fanning	21122—5	Baron	21000—2

No. 2 was at 7 live birds, \$5, birds included, handicaps 28 to 31yds., three moneys:

Harrison, 28	2210221—6	Wells, 28	2222220—6
Morfe, 30	2222222—7	Green, 28	2222122—7
Dr O'Connell, 29	2222222—7	Fanning, 31	2110221—6
Fessenden, 28	0222222—6	McMurchy, 31	2222222—6
Tuttle, 28	2102212—6	Waters, 28	20*1122—5
Hallowell, 30	0221201—5	James, 28	2121111—7
Money, 31	001*101—3	Harding, 28	0211212—6
Young, 31	2122122—7	Woods, 28	2222222—7
Douglas, 28	2200100—3	Rike, 28	2120222—5
Marshall, 28	0102121—5	Weldon, 28	0022012—4
Blauvelt, 28	1101122—6	Hafften, 28	0201210—4
Taylor, 28	2222102—6	Sands, 28	2022222—6
Doty, 29	2222222—7	Short, 28	0201101—4
Remsen, 29	2122211—7

No. 3 was at 10 live birds, \$10 entrance, birds included, four moneys. Before the 9th round closed twilight set in. Those who shot in the last half of the 10th round shot in the dark, and therefore had difficult conditions:

L Harrison, 28	2222122121—10	R E Packard, 29	2200111100—6
T W Morfe, 30	222122202—9	D W Weldon, 26	1100112200—6
A W Money, 31	2212*11221—9	A Sands, 28	2202222222—9
J J Topitz, 26	2122220011—8	W Doty, 29	2202222220—8
W H Sanders, 26	1211221102—9	M Douglas, 27	1212*1101—7
B Waters, 26	2212212222—10	L Taylor, 28	0*11110010—5
E H Lott, 28	112221221*—9	A Marshall, 27	0001101212—4
J H Hallock, 26	1111011012—8	W E Harding, 26	220*122200—6
F C Bissett, 26	2001112220—7	J L Green, 26	2111*02212—8
Dr O'Connell, 29	*202*02*22—5

After the shoot was over, three rousing cheers were given with a will for John Wright. Then there were calls for a speech, and John Wright in his modest way told how gratified he was, and how he hoped to do better next time, etc.

A miss-and-out opened the shoot. Each contestant stood at 28yds. Entrance \$2, three moneys. The score: McMurchy, Young, Fanning and Remsen, 6; Hallowell, 5; Morfe, 3; Sands, 2; Marshall, Rike, Weldon and Doty, 1.

Montana Gun Club.

The Montana Gun Club, a recently organized body, held its first shoot, Jan. 9, on their grounds, near Jamaica. The first event was at 15 live birds, as follows:

E Widman	...11111101101101—12	G Kinkel00111111111110—12
H Kroncka	...01100110111011—10	H Altenbrand	...01111111101101—11
J Kiroboe00000100111111—8	F Lundy01111110110101—11
J F C Elfers	...00111110010101—9	A Bersche11110100100110—9
Val Schmitt	...100000111100100—6		

took place at Dexter Park to-day. The number of members was small on account of a misunderstanding of a postponed shoot. The result of the shoot will be found below. An election of officers for the ensuing year took place, with the following result: Henry Knebel, Sr., President; E. A. Vroom, Vice-President; Dr. J. W. Moore, Treasurer; William Sands, Secretary. The club shoots under classified rule at monthly shoots. A chance is thereby afforded for poor shots to come in for a prize. Last year E. A. Vroom won the first gold medal, J. B. Voorhis won the second gold medal, Dr. J. W. Moore the silver medal. The dues are only \$3 a year. The club shoots every second Tuesday of the month, at Dexter Park.

Tom Donley's Tournament.

TOM DONLEY'S second international tournament was held at St. Thomas, Canada, on Dec. 27, 28, 29, 30. The weather was not ideal. It seemed as though the weather clerk tried to crowd into those four days samples of all his stock in trade, for the benefit of our American visitors. From mild to cold, from calm to high winds, with snow and rain thrown in to vary the monotony, was the order of the day. When this is taken into consideration, the attendance was fair, and the shooting above the average. Clean scores were next to impossible, even the experts falling down by the way.

The event of the tournament was the race for the Gilman and Barnes international live-bird gold medal, which was won by R. D. Emslie, a St. Thomas boy, with a score of 19 out of 20. There were twenty-four entries in this event.

A two-men team race took place, five teams competing, and resulted in a surprise for the experts. It was won by Donley, of St. Thomas, and Werke, of Cincinnati, who scored 19 out of 20. Hallowsell and Fanning were second with 18.

Great interest was centered on the five-men international team race, for a valuable silver trophy, between Detroit and St. Thomas teams, which was won by the St. Thomas Gun Club team by 5 birds. They used King Smokeless powder.

The birds used during the tournament were strong and fast, as shown by the fact that sixty are marked on the score sheets "dead out of bounds."

The management of the tournament was in the hands of John Parker, of Detroit, assisted by an efficient staff of local men.

Among the visitors were: J. S. Fanning, of San Francisco, representing the U. S. Powder Co.; Mr. and Mrs. M. F. Lindsley, representing the King Powder Co., of Cincinnati; John Hallowsell, representing the U. M. C. Co.; Tramp Irwin, of Chicago, representing the Lafin & Rand Powder Co.; A. Werke, of Cincinnati, and W. Thompson, of Jackson City, Mich.; Fairbairn, of Minnedosa, Man.; Marks, Mercier, Wood and Brady, of Detroit; M. Graydon, of London; Miller and Virtue, of Woodstock; H. Bates and Scane, of Ridgetown; Reid, of Hamilton, and others. Great surprise was expressed by all the shooters that Josh Wayner, of Hesper, champion shot of Canada, did not put in an appearance, especially as he won high average at last year's tournament.

First Day, Dec. 27.

In the first event, live birds, J. Handley, of St. Thomas, distinguished himself by making the only clean score. In the targets Thompson won high average, breaking 135 out of 140; Fanning second with 133; Hallowsell third with 128.

Events:	1	2	3	4	5	6	7	8

Thompson.....	22*0201202-6		

Extra event, 7 live birds, three moneys, 50, 30 and 20: Handley 7, Stotts 6, Fanning 7, Parker 5, Miller 6, Brady 6, Hallowsell 7, Thompson 5, Donley 3, Lindsley 6, Graydon 6, Emslie 7, Virtue 6, Scane 5, Werke 4.

Second Day, Dec. 28.

On this day more interest was shown both by shooters and spectators, as this was the day of the international handicap, for the Gilman and Barnes gold medal. It was won by R. D. Emslie, of St. Thomas, by a score of 19 out of 20. Geo. Fulton, of St. Thomas, was second with 18, while Brady, Fanning, Werke, Brown and Hallowsell tied for third place with 17. At the targets Thompson and Wood tied for first average, breaking 137 out of 140; Fanning second with 134; Hallowsell, third, 133. Mrs. Lindsley (Wanda) braved the storm and came to the grounds, competing in two 20-bird events, breaking 39 out of 40. Target scores:

Extra event, 5 live birds, \$3: Lindsley 4, Werke 2, Donley 3,

Graydon 3, Parker 3, Brady 2, Scane 3, Hallowsell 5, Fanning 5, Wood 4, Handley 4, Thompson 4, Virtue 2, Emslie 4, Stotts 5, Irwin 5, George 3.

Third Day, Dec. 29.

A number of extra events at live birds were shot off, but the principal event of this day was the two-men team race, won by Donley and Werke, who scored 19 out of 20. Fanning and Hallowsell second with 18, Bates and Emslie, and Stotts and Handley third with 17. Lindsley and Parker also shot (unplaced). At the targets Wood and Hallowsell tied for first average with 109 out of 115, Emslie second with 102, Fanning third, 101:

Fourth Day, Dec. 30.

On this day only one event was shot off at live birds, and that was captured by Joe Marks, of Detroit, who cleaned up his 15 straight: Wood, Fanning, Bates and Fairbairn second with 14, Werke and Tramp Irwin 13.

This was an interesting day at the targets, being the occasion of the international team race between Detroit and St. Thomas gun clubs, and which resulted in a victory for the St. Thomas Gun Club team by 5 birds. In the other events at the targets Fanning made high average, breaking 79 out of 95. Hallowsell second with 78, and Parker and Marks third with 76 each.

International team race for cup, value \$25; entrance \$7.50, \$10 added:

JAS. HAIGHT.

Fifth Day, Dec. 31.

The shoot, as advertised on the programme, ended on the 30th, but those inveterate dyed-in-the-wool sports who could not let a day pass with pigeons in reach and not shoot assembled at the grounds and made the following scores at live birds: Fairbairn won with 22 out of 25; Marks, Werke, Brady and Parker second with 20; Donley third with 19:

	2122221111220111*01012012-20		222122021202101111102021-20

"The sale of game should be forbidden at all seasons."
—FOREST AND STREAM, Feb. 3, 1894.

There be four things which are little upon the earth, but they are exceeding wise: The ants are a people not strong, yet they prepare their meat in the summer; the conies are but a feeble folk, yet make they their houses in the rocks; the locusts have no king, yet go they forth all of them by bands; the spider taketh hold with her hands, and is in kings' palaces.—Proverbs.

SNAP SHOTS.

HERE is a suggestion for those who are proposing elsewhere to follow Maine's guide license system. One serious defect of the Maine system is that the holder of a guide license is not of necessity a good guide. He may be, on the contrary, a worthless, incompetent, no-account woods loafer, whose foisting of himself upon his employer by means of his license, is a rank imposition. The holding of a guide's license in Maine is no evidence of ability and fitness. Nor, in default of discrimination between the competent guides and the incompetents, the worthy and the unworthy, can the Maine system more than partially effect its declared purpose of controlling the hunting through the guide.

This would be a better way: Make the obtaining of a guide license depend upon merit. Let the merit be determined by adequate examination and by duly prescribed giving of evidence. Make the fee for the license merely nominal; and let the taking out of a license be wholly voluntary. Under these conditions the license would mean something; it would be a guarantee of the character of the holder as a guide. Licensed guides would then, as a matter of course, be preferred to others. Every guide who could pass the required examination and demonstrate his fitness, would be eager to take out a license. An *esprit de corps* would be created, which would raise the standard. Such a system of voluntary license would inevitably advance the interests of all concerned. We believe that if the Maine guide law should be amended in this way the results would be most happy.

The Connecticut Fish and Game Commissioners repeat this year the suggestion urged in a former report that they should be empowered to lease tracts of land for State game preserves. We have advocated this very thing repeatedly; it is something which ought to be taken up by the game commissions of all the States. In these days of rapid increase of private game and fish preserves, of the acquiring and setting apart for private use of vast areas of lands hitherto open to the public, it is high time for the community to take steps to secure preserves for its own benefit. Such tracts are available at slight cost. To set apart wild lands as game refuges is at once the cheapest, simplest, most easily accomplished and most fruitful game preserving expedient open to the commonwealth.

It has been demonstrated time and again, and in widely separated sections and under widely diverse conditions, and with different varieties of game, that if a tract of land is strictly protected against the gun, the depleted supply will speedily increase and multiply and stock the preserve and overflow into the adjacent territory. Nature does the work, without effort or expense on the part of man. All she asks, the one condition she demands, and without which her beneficent work may not be accomplished, is protection from human interference, freedom to work in her own time and in her own way. Most of us can cite specific instances of this out of our own knowledge of some farm or piece of woodland, where the trespass signs

have barred the way, and the strict exclusion of shooters has given the game a chance to increase, to the ultimate improvement or restoration of shooting on all contiguous fields; so that the posting of that particular piece, which was at first resented, has since come to be recognized as a public benefit. In the development of the Yellowstone National Park game protective system, with its stocking of adjacent regions with big game, we have an example on a large scale. The Yellowstone Park game protection demonstration ought to be an example to challenge enterprise in the same direction in every State in the Union which has any game worth the effort. In the Adirondacks, for example, instead of permitting tens of thousands of acres of choice game country to pass into private control for exclusive preserves, the State of New York should have held on to what it possessed and have acquired much more that it might have come into possession of, to hold as perpetual game refuges for the advantage of the people for all time.

The establishment of game refuges is an enterprise which may well engage the attention of all who are interested in protective work.

Commissioner Carleton of Maine figures that the moose hunters brought into the State in the year 1897 the sum of \$125,000; and that the number of deer killed in 1898 was larger than in 1897, which would mean that in 1898 the moose hunters left more than \$125,000 behind them. And yet in the face of this there are people in Maine who think that non-residents should be compelled to pay roundly for the privilege of coming into the State to spend money for moose hunting.

There is one sentiment which must be reckoned with in these non-resident game restrictions. This is the feeling engendered by an alien tax, that one is an alien. The payment of his tax, as any Chinaman or Malay might be required to pay it at the border, gives one a sense of being among foreigners, and not among fellow citizens of the same common country. It is much like going abroad or crossing the line into Canada. Leaving the country, one leaves the home feeling behind. This home feeling is as all embracing as the bounds which mark the limits of the United States. The native of Maine may wander as far away as Texas, the Californian may find himself in Missouri, and the Dakotan in New Jersey; but go never so far, so long as he shall not cross the lines beyond which another flag flies to the breeze, or so long as he shall not run up against a stand and deliver non-resident hunting license tax, he yet may feel himself in a way at home, and not an alien. It is this expatriation, we are convinced, and not the exaction of the money itself, which is so repugnant to the man of fine sensibilities. And as this home feeling is one to be cherished and guarded and strengthened, so a community should pause and consider well before outraging the sentiment by an alien tax.

The abolition of spring shooting is something we have got to come to in this country, and the sooner we get there the better. In numerous cases where spring shooting has been done away with, the local shooting in the fall has improved in such a degree as to demonstrate beyond cavil the sound wisdom of the principle. We would be glad to have the observations of those who may send us facts to illustrate the effects of immunity for wildfowl in the spring.

We print in our angling columns two further letters in the correspondence addressed by Mr. Chas. Stewart Davison, of this city, to the Quebec Department of Lands, Forests and Fisheries, respecting the preservation of salmon rivers. The annual report of the Department shows an earned intention of dealing with the subject in an effective way; and it is not too much to say that the labors of Mr. Davison in this field entitle him to the gratitude of every person directly or remotely interested in Canadian salmon streams. The letters printed to-day, though written some time ago, have but just now been forwarded, in connection with a meeting held Jan. 24, in Quebec, for a conference of clubs with Commissioner Parent. The Commissioner sent out invitations last week to individuals and clubs to meet with him for the purpose of giving their views respecting the fish and game laws, and any desirable alterations in them. There is certainly no better way, as Mr. Davison remarks, for a department

to proceed intelligently in such matters than thus to consult representatives of fish and game clubs, and get their suggestions as to the framing of proposed legislation.

A recent experience of Hon. J. L. Gleaves, of Wytheville, Va., with bursting shotguns is not without its instruction. Mr. Gleaves was quail shooting, using a standard and reliable make of gun, with ammunition also standard and reliable; and both gun and powder safe under normal conditions. Two guns in succession burst in his hands, the shooter escaping injury as by miracle. When the gun makers came to investigate the affair, they discovered from the unused shells forwarded to them, that the charge used by Mr. Gleaves was not at all the charge he supposed he was using; and on inquiry it was ascertained that the local dealer from whom he had secured his ammunition, having run out of the particular nitro powder ordered, had substituted for it another powder, a very powerful compound, and had put in loads of double the proper amount as prescribed by the manufacturers. It was in fact a load which no ordinary gun could have withstood. Another shell in the lot was found to contain a trifling quantity of the nitro ordered by Mr. Gleaves, while the rest of the charge was made up of a fine grained black rifle powder. The dealer who loaded the shells in this way, or permitted them to be loaded, was, of course, the responsible agent here; he should be held for the value of the guns he burst; and had Mr. Gleaves lost his life, the criminal negligence of the dealer would have subjected him to a charge of manslaughter.

We print elsewhere a note of Game Protector Beede, of Essex county, in the Adirondacks, who seems to think that our recent paragraph remarking upon his inefficiency as a protector consisted of anonymous statements, which were false and malicious, and could not be proven. So far from entertaining any malice, we recorded Mr. Beede's direlections with genuine sorrow that one who formerly had done such good service should have degenerated so lamentably as practically to let protection go by the board in his district. It was notorious last season that deer hounding was practiced without cessation in Essex county. The music of the hounds was heard day in and day out. Travelers on the public highway encountered deer hunters driving along the road with deer guns in the wagon and deer dogs under the wagon. Still-hunters frequently followed their game only to have it cut out and driven away from them by the hounds of hounding parties. Deer chased by hounds raced through vegetable gardens. At some sporting resorts the vast majority of deer killed were killed by hounding. At some resorts deer were killed practically in no other way than by hounding. If there had been no law on the subject and no Protector Beede, the hounding in some parts of that official's district could not have been more open and free than it was, there being a law and a Protector Beede. Several of the Essex county papers have quoted what we said, but we observe that no one of this protector's home papers has questioned the accuracy of our statement of the situation.

The Canadian Fisheries Department has received a report from a former employee of the department now in Dawson, who reports that the Yukon fish are of great value for a food supply. The species include whitefish, buffalo-fish, pike and grayling, the whitefish and grayling being of a superior kind. It is the announced intention of the department to provide suitable regulations for the fishing, that the supply may not be wiped out.

An effort is making to change the sessions of the New York Legislature from annual to biennial. For one thing the change would be of decided advantage with respect to the game laws. As it is now, the public can hardly learn what the law is at any given time before it has been tinkered again into something quite different; whereas, if there were two entire years between changes, people might indulge in some confidence that they knew what the law was.

The open door may be a good policy for China and the Philippines, but it is a short-sighted system for Eastern markets for Western game. The corked-up-tight policy would be better. Washington, New York and Boston should be closed ports for Minnesota venison.

The Sportsman Tourist.

Yukon Notes.

Story of the Colorado Miners.

A STRANGE chain of circumstances starting at the headwaters of the Klondike River the preceding summer led to the recovery of the missing boats. A party of Colorado miners had made their way up this beautiful rapid stream to its source, 150 miles from Dawson. Only one other party had penetrated so far, and these men had turned back without prospecting and fled ignominiously, driven out of the country by wolves. The Colorado miners were good hunters and well armed, and though the great Alaska wolves, which are the largest in the world, came close to their camps at night, they were not alarmed, and industriously prospected the main stream, as well as the various pups and gulches they passed. They found no gold worth mentioning, but they killed three moose and enjoyed themselves while the pleasant weather lasted.

And so the short summer passed and the time came for them to return to Dawson to lay in their winter supply of provisions. They anticipated no trouble in securing the needed outfit, for they had heard nothing of the inrush of 4,500 men from the outside world, who had settled down on Dawson like a swarm of hungry locusts and already devoured everything in sight.

How tirelessly minute and incomprehensibly complicated are the workings of Providence! If these miners had not been cut off from information and so lost their chance of securing a grub stake, there is little probability we should ever have recovered our lost boats. As it was, they found it impossible to winter in Dawson, and nothing remained but to start for the coast without delay. The ice had temporarily jammed in the Yukon, and thinking the river had closed for good and all, they started Oct. 22, with five weeks' supplies lashed to hand sleds.

The first day out the river opened again, and the miners secured a boat and struggled desperately to make progress by tracking. In this they were unsuccessful, and they were obliged to resort again to their sleds, dragging them where feasible along a narrow rim of shore ice, and at other times taking to the land and scaling the precipitous banks of the pent in river.

Sometimes they followed for miles the base of bastion-like cliffs only to come to places where their narrow ice path ended, sheared close off by the sweep of the throttled river. Long detours were necessary to get around such places, and these involved climbing that was difficult and dangerous to an extreme.

Once one of the party who had gone ahead to look out a route slipped and barely caught himself at the edge of a vertical drop of 200ft. Below was the dizzily hurrying ice current, and he did not dare look down. Above was a rounded edge of crusted snow and icy rock that afforded no foothold, or roughened projections which he could grasp with his hands. He was in a trap, from which he could not unaided rescue himself. An hour later his companions found him half-frozen, hanging on with stiffened muscles and closed eyes. This man had easily been the most daring of the party, but after that his nerve was gone, and he was content to keep in the rear and let others take the risks.

Their progress was necessarily very slow. Once, owing to a detour, they found that after a day's work they had actually lost ground. Sometimes they were unable to draw their loaded sleds up the places it was necessary for them to climb, and they had to unpack and take the loads over a little at a time on their backs.

Five days' travel above the Stewart River they sighted a raft grounded on a bar in mid-channel. The shore was a maze of wolf trails, and a number of ravens had alighted on the cargo, which proved to be sheep carcasses intended for the Dawson market.

The miners spent a day attempting to reach the raft, but in the end were unsuccessful. Their supplies were getting low, and the fresh mutton would have been a god-send.

Further up the river they had a similar experience with a beef raft. It was tantalizing to see so much good food going to waste when they were already contemplating the likelihood of starvation.

Thirty miles below Selkirk their supplies were almost gone, and the miners were still the best part of 500 miles from the coast. The river is about half a mile wide at this point. Across on a flat which marks the mouth of Selwyn Creek they saw a boat drawn up out of reach of the ice. The river had jammed again, and two of the miners, whom I will call Lingard and Dartois, though these are not their names, started across on the ice to beg supplies. When they were in mid-stream the jam began breaking up, and the two men saw death staring them in the face. They looked first at the north bank where their companions were, and then at the other shore, and saw that the latter was nearest. In another moment they were racing desperately toward it, leaping at times across great fissures, where the black water yawned for them, and at times floating down on detached unstable masses.

Eventually, more by luck than anything else, they reached the south bank of the river. They made their way to the tent of the men whose boat they had sighted, and told their story. The strangers said they were sorry for them, but that they were short of food themselves. They gave Lingard and Dartois their dinner and a few pounds of oatmeal, and told them they had nothing more to spare.

Lingard and Dartois could not rejoin their companions and they had no axe or blankets. At night they kept from freezing by building two fires and huddling between them. They could not sleep for the cold, and much of their time was taken up breaking loose with their hands and dragging to their fire portions of dead trees for fuel.

For four days and nights Lingard and Dartois suffered the Esquimaux's hell, which is slow death by freezing.

The fifth day Lingard, who was leading, under the guidance of what appeared a strange perversity of judgment, left the shore line of the river, where the traveling was good, and the river bordered by the only piece of flat land for ten miles, and crossed over to an island. When they reached the head of this island the two men found

themselves cut off from the main land by open water. It looked as if they would have to retrace their steps, and Dartois was not slow to upbraid his companion for taking them out of their way.

Lingard was put on his mettle, and seeing a narrow strip of ice reaching to the next island above, which, as it happened, was still further out in the river, he determined to gain that instead of retreating. It was a risky enterprise, for a strong current set full against the rim of ice and it might be carried away any moment by the drifting masses, which were continually carried against and under the obstruction. In their desperate condition, however, the men had lost the true perspective of danger, and were willing to take any risks.

When three-quarters of the way over, Dartois, who was following, uttered an exclamation and called his companion's attention to something under a piled-up ice mass he had just crossed. Lingard looked and saw a piece of white canvas, and near by a broken end of rope. The things were suggestive, and the two men set to work removing the ice as best they could with their hands.

Beneath the canvas they soon recognized the rounded form of provision sacks, and at one side some implement with a handle. As soon as they were able to do so, they ripped the canvas open, and the contents of one of our freight boats were revealed. The handled implement proved to be an axe, and with its aid they made progress rapidly.

A second boat was uncovered, and in this the two castaways found a tent. They were half-starved and could wait for no further discoveries. Lingard shouldered the tent, and axe in hand led the way to the island. Dartois followed with a partly used sack of flour in one hand and in the other a galvanized iron horse pail half full of frozen sugar syrup, and the other half filled with dried peaches, which he had gotten from one of the sacks. The syrup was a memento of our shipwreck in Lake LeBarge. We had placed the wet sugar sack in the horse pail in order to save what leached away.

They built a fire and had a meal of flapjacks and stewed peaches. What the repast lacked in variety was fully compensated for by its abundance, and the poor fellows spent the best part of an afternoon eating their doughcakes and sickly sweet peaches.

They pitched the tent back in the woods on the island, where it was out of sight from the river and mainland as well, and the day following they removed the cargoes of the boats and carried the things to their camp. There is reason to believe that Lingard and Dartois, though they had stumbled on the boats by the merest accident, knew of our loss, and knew that we were at Fort Selkirk, only six miles away. One of the men seen at the time of their separation from their party knew the details of our missing boats, and as the information cost him nothing to impart, he was probably ready enough to give it away to the men who asked for food.

Lingard and Dartois did not want to run the risk of a refusal of supplies from the owners of the boats, and no doubt they determined to wait where they were till the river closed, and then rejoin their party, with whom they had managed to keep in communication by signalling across the river. The united party could then take what provisions they needed and pass by Fort Selkirk on the opposite side of the river without our knowing anything whatever of the occurrence.

Fortunately for us, however, Providence had a different plan, and twenty-four hours after the boats were discovered Lingard froze his feet. There was no stove with the boats, and an unheated tent was no place for a man in that condition. There was but one thing to be done, and Lingard set out at once for Fort Selkirk.

He reached our cabin just at dark, and we took him in and bathed his feet with kerosene and poulticed them with desiccated onions, warmed in the frying pan. Afterward we gave him a good hot supper, and promised him a place between us in the sleeping bag we had constructed by sewing the edges of 70lbs. of blankets together.

When he had finished his supper, Lingard told his story up to the point of finding the boats. Then, after much beating around the bush, he tried to make a bargain with us for information regarding the whereabouts of the boats. Mac and I at once recognized the fact that he had found our lost outfit and that it must be somewhere near by, and told him as much. We refused to make a bargain, but told him that we would not see anyone starve while we had food ourselves, and in the end he threw himself on our mercy.

It was long after midnight when we finally got to bed, but all three of us were easier in mind, if I am not mistaken, than for many a long day.

We were up betimes in the morning. The stars were still twinkling overhead when Mac returned from the river, where he had gone to get a pail of water, and announced that the Yukon had closed. The information seemed to distress Lingard, who probably had no great faith in our verbal promises. The poor fellow had learned by bitter experience that charity is a rare quality in the Yukon when it comes to giving away food, and one could hardly blame him if he was thinking of the other course of action he might have taken, even with frozen feet, if he had known the river was going to close so soon.

Mac agreed to try and communicate with Lingard's party, and it was decided that I should set off down the river at once to the point where Dartois was camped with the lost provisions. Mac and I still had a hankering dread lest the other members of Lingard's party might decamp with the food, and it seemed best to have one of us on the spot as soon as possible.

Some Indians who came in while we were at breakfast told us that the river was still unsafe, and that it would not do to trust to it till the following day. The water had backed up 12 or 15ft. and every once in a while the ice, acted upon by the great pressure above, moved ahead a little. Patches of open water were visible here and there, and in places the ice was flooded to a depth of several feet. The band of shore ice which Lingard followed had, of course, disappeared.

I determined to travel as much as possible of the distance to the island by land, and soon after daylight fastened on my Alaska snowshoes, which are twice as long and only half as broad as the common American web shoes, and set off.

The first three miles of the journey was easy enough, but then I came to the gate of the Ramparts, and my difficulties began. Here a low but terribly precipitous moun-

tain, with a perpendicular face to the river, opposed further progress. I made several unsuccessful attempts to scale it, and when at last I succeeded I found the way so blocked by slides and ledges, and the day so far gone, that it was plainly impossible to reach my destination before night by that route. Only one course remained, and that was to take to the ice of the river.

I retraced my steps, struggling through the soft, fluffy snow up to my waist, for it was impossible to use snowshoes on such a hillside, and eventually reached the river bank just above the mountain. I secured a pole to test the ice, and crossing 30ft. of open water next shore on a great cake of mush ice, gained a footing on the main floe in the channel.

Darkness was fast settling down, and before I had gone a mile night was upon me, black and starless. The spectral outline of the nearest mountain was almost lost in the gloom, and had it not been for the reflection of the ice and snow I should have been unable to travel.

Owing to the backing up of the river and consequent flooding of the ice, a thin skin of brash ice covered the surface in many places, and sometimes this concealed dangerous pitfalls. At times I drove my pole through this flimsy covering into the black current beneath, that ran with the speed of a mill race and pulled at the pole as if struggling to drag it from my grasp. Once I came to a rapid that was still for the most part open water, and had to cross this on a narrow bridge of ice that rocked with the recoil of the white-capped waves dashing by.

It was two hours after dark when I reached the island and found Dartois crouching over his fire. The poor fellow was sick and half-frozen, and seemed almost to have forgotten how to talk, though his difficulty with articulation was partly due to stiffened lips. His pleasure at seeing a fellow being was very marked. He got me something to eat, and then I proposed that we should go back together to Fort Selkirk for the night. Dartois shuddered at the thought, remarking that in the first place he did not think he could walk six miles in his present condition, and in the second, even if it were possible he could not risk the trip in the dark for all the gold in the Klondike. Not even the thought of a warm bed and food cooked over a stove could tempt him.

As he would not go back with me, I resolved to stay with him, and asked what bedding there was in camp. Dartois said the only things they had rescued were a Kenwood sleeping bag and a red blanket. This latter was somewhat the worse for wear, as it had been used for a horse blanket on the Skagway trail.

"Lingard and I got in the sleeping bag together and put the blanket over us," he remarked, "but then Lingard is thinner than you are—lost it since we left Dawson." I recollected that Lingard was the build of a fence rail, and as Dartois said it was a tight fit, I had little hopes of getting into the bag.

I had wet my feet coming down the river, and spent the evening drying out socks and moccasins. The provisions were piled up at one end of the fire to form a wind break, and close by was the tent, pitched low and partly covered with snow. It was a bitter cold night. Dartois looked once at the spring thermometer, a very reliable instrument that had formed a part of my outfit, and announced that it registered forty below zero. Finally the last of the dry wood was put on the fire, and Dartois said there was no more on the island, and that we must turn in. "We must make the best of it till morning," he remarked; "God knows if we shall ever see another day."

He led the way into the tent, which was covered inside with ice from congealed breath, and was about as inviting a place to sleep in as one of the vaults of a cold storage warehouse. He cautioned me to rub my nose to keep it from freezing, and crawled down into the sleeping bag.

I attempted to follow, but stuck fast when I got as far as my hips. The bag pinched so that I was afraid it would stop the circulation, which would make freezing all the more certain, so I drew back, leaving only my feet in it. A few spruce boughs and a piece of canvas had been laid on the snow as a foundation for the bed. Below that again was fifty or a hundred feet of perpetually frozen ground. I spread one thickness of the blanket on top of the canvas, and then drew it up around my body and over my head, and thus protected put in a night that, aside from the mental worry, was not nearly so uncomfortable as one would have expected.

Of course sleeping was out of the question, and all through the long arctic night Dartois and I kept up a desultory conversation. Inside my heavy buckskin gauntlets my hands became numb and ached, and from time to time I could feel the cold take hold of some particular portion of my body with stealthy nipping fingers that made me writhe at the thought of what might be the consequences of that leperous touch. We turned over frequently during the night to assure ourselves that circulation was not impaired, and never once did we get into that blissful dreamy state that is said to come to persons when freezing to death.

Earlier in the evening, with a roaring camp-fire of spruce logs to give warmth, I had shivered and felt almost as uncomfortable as now. It could hardly be possible that a single thickness of threadbare blanket was in any way equivalent to the fire. The subject of the power of the human body to resist cold is a puzzling one. Not only training but also will power seems to enter the problem. I believe now that if I had been in a discouraged and hopeless frame of mind, I might easily have frozen. Bodily nourishment had also a good deal to do with my ability to resist the cold, and the supper I had eaten, though scanty and poorly cooked, was a factor of the greatest importance.

Equally mysterious is the effect of training. Why is it that Andrew Flett (mentioned earlier in these articles) did not freeze wearing the lightest of clothing in mid-winter? One can readily understand that he could accustom himself to be more comfortable scantily clothed than another man under the same conditions, but when the man beside him freezes to death it is hard to understand how Flett escapes the touch of the frost. Natural vitality and good circulation could hardly account for the difference.

When Dartois and I crawled out of the tent the following morning, we found the weather had moderated considerably. We hustled round and got some wood, and had breakfast. Afterward we set out for Fort Selkirk, meeting on the way a relief party with a sled.

Lingard, Dartois and the other members of the party

stopped with us at Fort Selkirk several days to recuperate, and when they left they had ample supplies to carry them to the next stage of their journey. Lingard's feet permitted him to hobble along with the aid of rough crutches, and at times he rode on a sled.

We learned afterward that the party reached the coast in safety, though one of its members, a man whom we knew as Sam, had had his gee pole arm seriously frozen, and mortification was reported to have set in.

J. B. BURNHAM.

In Old Virginia.

Part II.

A FEW mornings thereafter I concluded to try the quail. Hon. John S. Wise has his intelligent friend Diomed say that Virginia is the "hub" of the universe for this bird, the gamest of all our game birds.

Virginia quail, he says, are larger than any other quail in the world, and travel in any direction you may from Virginia, you will find them less in size, and lacking in dash and vigor.

My rather general experience leads me to believe that this statement is not exaggerated.

The Virginia birds certainly dress larger than any birds the writer has ever shot, in a shooting experience ranging from Minnesota to Florida, and with a fair radius East and West. Your host always expects you to "carry a boy" with you on all expeditions, whether afoot or horseback, in old Virginia; to open gates, pilot you about, carry your game and make himself useful in any other manner desired.

There is nearly always one or more bird dogs to be found on the plantations, generally very well bred, but unless regularly hunted they are often illy broken, or sadly demoralized by association with "the boys," who are inveterate rabbit hunters.

The dog belonging to the plantation where I was visiting had met with a fatal accident a few days before my arrival, and his successor had not yet been installed. A neighboring sportsman, the owner of a pair of fine pointers, had promised my hostess to bring his dogs and shoot with me for the day.

Completing my preparations before the time set for his arrival, I concluded to take a turn in the open near the house to work off the wire edge, and perhaps get a chance shot to get my "eye in" for the regular business of the day.

My hostess came to the door to see me off and wish me luck. Noticing that I was unattended, she at once sent Millie, the maid, who was pretending to sweep the walk, but who was in reality enjoying herself watching us, for a boy. Millie soon returned, followed by two candidates for the position of gun bearer or game carrier. One was a good, big boy, heavy and awkward; the other was what I had heard the overseer call a "chap." The big fellow was barefooted and stood digging his toes in the ground in uncomfortable embarrassment. The chap was erect and important in a new pair of brogans as stiff and hard, apparently, as though made of raw hide.

The little fellow was my choice, and the big boy was sent back to the woodpile. My selection stood as erect as a drum major, looking me straight in the face, without moving a muscle. He was black, slim as a sapling, and thoroughly wide-awake looking. The comely proportion of his legs was fully visible from the tops of his shoes to 4 or 5 in. above his knees, looking like a pair of well-scorched laths; at this point began a pair of diminutive trousers that fitted him almost as tightly as his little black hide; a worn shirt and a bit of hat, that looked like a lid, completed his outfit. Nearly all negroes are deliberate of speech. Not so this chap.

"What is your name?" I asked.

"Guv'nah, suh," was the instantaneous reply.

"Whose boy are you, Governor?" I then asked.

"I Aunt Mary's boy, suh," quick and sharp came the answer.

"How old are you?"

"Twelve-goin'-on-thirteen, suh."

"Are you a good walker?"

"Yaas, suh."

"Do you want to go hunting with me?"

"Yaas, suh."

His alert, terse manner had impressed me favorably, and he did not prove at all disappointing on closer acquaintance.

When we reached a promising bit of stubble I ordered Governor out to the right wing and we started in to walk up something. The first flush was a field lark, and as I was shooting a new gun and needed practice, I classed him as game.

As he pitched for the ground my boy darted for him like a sparrow hawk after a snow bird, and retrieved him promptly. A few steps further, and we jumped a rabbit. I cut the weeds around him, but as he was running strong when the smoke of my broadside cleared away, I had to conclude that the gun was a little new yet. Nothing more offered until we reached the fence at the further side of the field. Here, as we threaded our way through some briars, we were fortunate enough to walk into a covey of birds.

Just as they flushed I had noticed my boy reach up to grasp the fence, preparatory to climbing over. After I had killed my first bird, much too close, and missed the second, that I ought to have killed properly, I glanced around, and there stood that boy in the exact position still with hands up in the air. At a nod from me he ran over the fence like a squirrel, and was back with the dead bird when I dropped off on the other side. I had marked the covey down on a hillside near by, where the growth was sedge grass dotted over with stunted field pines. When we reached the spot where I expected to find them I sent the boy up the slope, about 50 ft. from me, and bid him keep in line and watch carefully where any dead birds fell. The first flush was a single, straight away. He fell, clean killed, to my first barrel. Bidding Governor mark the place, we moved on a few steps and two birds flushed at my feet, followed an instant later by a third. They swung to my right, flying low, and when I drew on them they were in a line with the lid that did duty as a hat on the boy's head.

"Stoop down!" I shouted as the first bird pitched over

his head, too close for safe shooting. The little image failed to understand the order and stood like a statue.

"Stoop down, quick!" I shouted, as the second bird tapped him in its rapid rush for safety. Then, in desperation, as the last bird approached him, I yell "Squat!" and the boy disappeared as though the earth had opened and swallowed him, and I killed the bird—a long shot—with the choked, hard-shooting left barrel. A little further on we flushed three more birds; one I killed, but the other two were lost by my failure to connect on both as they crossed in flight, a feat often performed when in better practice.

One more bird was flushed and knocked down as we returned, but our combined efforts failed to find him.

Concluding that he had only been winged, and knowing that it was useless to hunt for him without a dog, I had turned and started for the house, when my boy called out: "Here Jeff, suh; he fin' him foh you."

"Jeff" was a thoroughbred after the order instituted by the small boy, being "one-half shepherd and the rest just dog," and I could not feel the slightest encouragement by reason of his talents enlisted to aid in the recovery of the lost bird.

But Jeff had evidently been blessed, a few generations back, with an ancestor possessed of a nose; and was now able to materially aid and profoundly surprise those unaware of his distinguished lineage. Being directed to the spot where the bird had fallen, he took up the trail as promptly as any prize winner at field contests could have done, followed it to a dry ditch 25 yds. away; sped up the ditch in a run for 50 yds., stopped short, crept up through the weeds on one side 25 ft. or more, clapped his paws down on a fluttering, broken-winged quail, and looked around at the boy, who had followed close behind him, for further orders. If a cow grazing in the field had done the same thing it would have seemed but little more surprising and unexpected. On our return trip to the house one more opportunity offered to add to the bag. It was what the boy called "a fine, fat ole haar," when he brought him in, and was undoubtedly, to him, the most satisfactory event of the expedition.

My shooting companion had arrived when we returned to the house, and we set forth at once for the real business of the day.

As we intended looking up the survivors of the covey I had discovered, and the field was near the house, our fair hostess donned her corduroy suit and accompanied us to see the opening of the hunt.

The pair of pointers over which we were to shoot was everything desired in appearance, and their work proved in keeping.

We hunted first down the other side of the ridge that I had been shooting on, and soon struck scent. Both dogs worked on the trail of what seemed a single bird leading straight away. They were side by side when they found game, and the point was beautiful. We ranged up in a line near them and stood several moments enjoying the magnificent sight before giving the order to flush.

The flush yielded a brace, which separated, one flying straight away, and the other swinging around over my left shoulder, with the wind under his wings. I hated to miss the first chance offered me in the presence of our fair audience, but felt the utter hopelessness of overtaking that brown meteor with anything less speedy than a streak of lightning.

More to show my good intention than in anticipation of any result, I hastily fired in the direction of his flight and scored a beautiful accident, although this is the first admission of its being such. The bird whirled down almost to the foot of the hill before striking the ground, so great was its momentum.

My companion had attended to the other bird in a quiet, orderly manner that proved him a veteran. The dogs divided the honor of retrieving, each bringing in a bird.

Moving on, we next flushed a single, which the Virginia gentleman allowed me to kill, courteously refusing to swing his gun from the comfortable shoulder rest when he saw but one bird up.

Two birds from the ground and a hawk from a low, thick pine tree were the next flush. Following my inviolable rule, I paid my respects to the hawk first, cutting him down with the right barrel, and then, contrary to the rule of virtue always rewarded, missed my bird entirely.

My companion, more skillful, saved him for our bag by a long shot, followed immediately by a courteous apology to me for killing my bird. It was very considerably and affably done, but he "wiped my eye" just the same.

Fur was the next event. A rabbit was jumped by his Excellency, the diminutive Governor, who was stalking solemnly along in the rear. It surprised him into speech. "Haar, suh! Huah he go!" he shouted.

He passed near me, and out of respect to the dogs I let him go. It was no small sacrifice either, as when out for general all-round sport I am much addicted to throwing the festive "cottontail" his three to nine flip-flaps, that usually immediately precedes his transfer to the game bag. My consideration for the dogs was rewarded by as pretty an exhibition of perfect training as it had ever been my lot to see. They were working in near us, and close together, and the rabbit, under full steam, dashed right between them, without any other result than causing them to show a lively interest in his hasty and erratic movements; and they were both young dogs, just beginning their second season.

We were now waited by the big bell at the house that a pleasant duty awaited us there in the shape of dinner, and the hunt was called off until afternoon.

En route to the house I strayed a little and was successful. The disappointment in the little bright black face of the small darky when the rabbit was allowed to escape had touched me, and I was looking for consolation for him at a safe distance from the dogs. I found it, and it was a fine one. A great big, reddish-brown fellow, the kind they call woods rabbits. Holding straight down the row, he was boring through the weeds. I persuaded him to stop running and proceed to throw back handsprings, not more than two or three of which had been accomplished before the boy had him by the hindlegs and was knocking the remaining kick out of him by blows on the back of his head with his little black fist, while his eyes fairly sparkled with excitement and satisfaction.

Bidding him carry it to his "mammy," her cabin being near, I joined my companions. It was some time after

the pleasant discussion of the dinner that we found waiting for us before we started in to finish our hunt.

Our hostess had declared her sporting blood fully cooled by the fatigue of the morning trip, and declined our invitation to accompany us. We found my boy sitting on the horse-block outside the gate, evidently waiting our appearance.

I was about to dismiss him, as we intended taking only a short trip, and there was no likelihood of our game pockets overflowing; but it occurred to me that possibly Governor was an embryo sportsman, and that it was as much a following of inclination as devotion to duty that caused his promptness. "How long have you been waiting, Governor?" I asked him.

"Dunno, suh; 'bout two houahs, I spec."

"Didn't you get tired of waiting for us?"

"No, suh. I was des 'fraid you all had dun made up your min' not to go."

I was getting "warm" in my investigation, as the children say. My theory of sporting blood was fast gaining ground.

"What is that in your pockets?" I said, pointing to two suspicious-looking bulges in his pants pockets.

"Dis one is 'tater," said he, touching one pocket, "and dis is biskit," touching the other.

"Where did you get them, and what will you do with them?" I asked.

"Aunt Ellen give um to me, suh, foh my dinnah; 'cause I 'fraid you all start out foh I git my dinnah eat if I wait 'til hit reddey."

That settled it. It was sporting blood "of the purest ray serene" that animated this little African Nimrod. The half-formed resolution to dismiss him was laid on the table, and we proceeded to the business before the house as a whole. The covers did not yield well, and our afternoon was threatening to prove an "off day," when along toward 4 o'clock we reached a field covered with an unusually heavy growth of sedge grass.

The weather had grown cloudy, and the short December day bid fair to soon close. We concluded that the birds might be going to roost, and as heavy sedge grass is their favorite place, we would take a turn through the field.

The dogs had but fairly entered the grass when they found birds. A covey flushed which yielded us three birds, I having missed my first. A little further the dogs pointed, and it was another covey. We stopped four of this lot. But a few steps further, and to our intense surprise another covey flushed. Three of them was our share, owing to both having shot the same bird with the second barrel. Again within a very short distance we found birds, and again, and again, until out of that sedge field we had put up over ten covies of birds in less than one hour. We wondered, "and still our wonder grew," as did our bag. We got something out of every covey, and occasionally four.

It was not until the next day that the mystery of the birds crowding into the sedge-grass field in such numbers was explained. That night began one of the worst winter storms of years. A very heavy snowstorm was followed by intensely cold weather, the mercury falling to zero and below. It lasted for weeks, and when the weather at last moderated all but a very hardy few of the thousands of birds that had made the "Old Dominion" a sportsman's paradise were frozen to death.

My sporting ethics are orthodox, but whenever I think of all those fine, well-conditioned birds freezing and wasting, I rather regret every show of moderation on our part during that day's hunt. Our return trip to the house was without incident, at least without anything of interest to any charitably inclined person.

It is true that the dogs found game, and my companion decided it to be a single bird, and sent me forward to kill it. That when the bird flushed and flew straight away I shot as true as in me lay, in the line of his departure, without disconcerting him, and my friend, from 20 ft. behind me, killed him as coolly and easily as though quail in a hurry at 60 yds. was his favorite target in the latter part of a dark winter afternoon; and that another bird flushed at my right bootleg an instant later, and swung over the rising ground along which we were passing, that slid through my second deadly charge, to be most scientifically grassed by my friend with the true eye and steady hand.

These incidents, I say, were of no special interest, but the courteous and kindly excuses made for me, in extenuation of my execrable shooting, by my superior, as he had just proved himself, was a beautiful lesson in "the greatest of these."

Returning to the house with about the load of fatigue that a man might expect to carry after a whole day in all sorts of cover, I was just deliberating as to whether I should not go to bed hungry, rather than undergo the further exertion of changing my clothes for supper, when in response to a knock on my door, and "Come in," a girl entered carrying a waiter covered with a snowy napkin, on which rested a glass containing some botanical specimens.

"What is it, Milly?" I asked.

"Hit's a Jew-lip," she replied; "Mis' Lady'lowed as how you'd be right smaht wo' out, en she sen' hit to refreshen you up, suh."

I dutifully proceeded to take the remedy for fatigue, and prescription for "refreshen." Took all that I could persuade to drain out of the glass, then carefully scraped out the remnant of an ingredient that seemed to have saccharine properties, chewed up all of the botanical specimens, and carefully licked the spoon. Then, after resting a few moments, I proceeded with my preparations for supper with such vigorous alacrity that I was moved to speculate on what might have been the result had my hostess mixed me the entire Israelite and sent him up.

I am conscientiously opposed to any general use of stimulants, but I would hate to have to maintain that position against a continued siege of Virginia "Jew-lips," for they, like the Old Dominion's hospitality and her fair daughters, are absolutely irresistible.

LEWIS HOPKINS.

To me nothing comes so near to filling the place of a real hunt as to read a detailed account of one, which I believe to be true, which feature I believe to be prominent in FOREST AND STREAM literature, else I would not have my name on its mailing list, much less its list of contributors. EMERSON CARNEY.

Saint Peter's Gate.

A Camp-fire Story.

THE idea of St. Peter as the stern custodian of a certain straight gate at the end of a narrow way has lent itself to so many good stories and conceits that some future day some literary collector may wish to gather them all into a volume. And there are enough of them for the literary analysts who love to classify all varieties of wit and humor under scientific names—like burlesque troupe, heterography, perverted logic, etc.—to give them a whole genus all to themselves, with as dignified a name as any of them.

I was once present at a camp-fire seance where the conversation, happening to lead, as it were, to St. Peter's Gate, lingered around it, and finally, as a reminiscence of an old army camp-fire on the plains, drew out the most elaborate of all the St. Peter stories which I have ever heard. It is worthy of preservation, and I will give the conversation from the beginning.

Some one remarked that our cook had made a good job of his coffee that night. Our old Colonel had lit a reminiscent pipe. He had campaigned in Utah under Albert Sidney Johnston in the '50s, and in Virginia under Lee in the '60s. "Yes," said he, "that was good coffee, and, as good coffee always does, it reminded me of the best cup of coffee I ever tasted in my life. It was in the woods in front of Chancellorsville, on the night of May 1, 1863—the night before Stonewall Jackson was killed.

"There was a little incident connected with the matter, and I will tell you of it. Gen. Jackson was the sternest disciplinarian I ever saw, both toward his officers and men. His best major generals were no more exempt from a sudden arrest than the humblest private. Late that afternoon I passed him with a gun I had had out on the skirmish line. The sergeant had a new rubber overcoat tied on his pommel. The General called me and asked: 'Where did that man get that coat?' 'Picked it up out on skirmish line.' 'Arrest him and prefer charges for plundering on the battlefield.' Of course, I arrested him, but I felt worried about it, for he was one of my best men and a fine gunner, and I had seen him pick up the coat without objection, for very few of our men had any rubbers.

"Well, after night had stopped the fighting, I got all my batteries together in bivouac, in the woods, and we got a chance to eat a little supper, having been on the go since daybreak. At that time the whole Confederacy had been out of coffee for so long that we had forgotten how it tasted. All sorts of substitutes were in use, but principally parched corn. At least that was what we used in the artillery, because we could generally get corn—the consent of our battery horses being expressed or implied. Just as I at last sat down on the root of a tree and opened a little package of cold bacon and corn bread, one of my battery commanders, Capt. Parker, came up, bringing me a big tin cup brim full of scalding hot coffee—real coffee, and ready sweetened with nice white sugar. He had already had some, and he sat down by me waiting for the cup, while I cooled and drank it, and the taste and flavor permeated my very bones. They have reacted to good coffee ever since. Of course, I asked Capt. Parker where he got it. He showed me a buckskin bag, holding about a quart, still half-full of coffee, parched, ground and mixed with white sugar. He had gotten the bag, and the big tin cup, too, from the dead body of a Federal soldier. I said nothing, and I did not enjoy the coffee one whit the less; but I did wonder what Gen. Jackson would do if he should catch us.

"And the next afternoon, as we were going into action, and the captain of the sergeant's battery came and begged me to let him go back to duty with his gun, I remembered my participation in the coffee, and I released the sergeant from arrest, feeling that he had done nothing worse than I had. But I realized that I would have a difficult explanation with Gen. Jackson when the fight was over. I determined to risk it, however, along with all the other chances of the big battle before us; and as fate would have it, that night the General fell with his mortal wound.

"I have often thought over the matter since, and the more I think of it, the more disagreeable seems to me the position in which I might have found myself had Gen. Jackson lived. And that is the one possibly unpleasant interview I look forward to in the next world when I get there. I will perhaps have to hear what the General would have done about it.

"But I will be glad to explain the whole business to him, and perhaps get him to modify some of his former views, if he has not already done so. As Capt. Parker was in it, he will just have to, for a better man than Capt. Parker never walked this green earth. Courage, truth and unselfishness might have learned their trades from him, and his whole life (he is a doctor and is still living) has been given to works of charity—even Stonewall Jackson won't outrank him up there. Indeed, whenever my time comes to interview St. Peter and get through that gate of his, if he starts out to cross-question me too closely about old bygones, I'm going to use Capt. Parker's name as my first, last and only reference. Peter can't refuse a man who was as intimate with Capt. Parker as I can prove myself to have been. I have got the record on him upon that."

Our party included a young man, an extensive reader of ephemeral humorous literature. He said: "That's a pretty good scheme. I'd like to have a little pull with Peter myself. I've heard of a plan once tried by a Brooklyn man which is said to have worked. This man died about the time when some great scandal was being ventilated in Brooklyn, and the name of the city became a byword in the papers for immorality. When this man presented himself at the gate, Peter asked: 'Where are you from?' 'Brooklyn,' said the man. 'Well,' said Peter, 'you'll have to wait a few days. There has got to be a special investigation in every individual case before we can take any more Brooklyn people in here. You wait a few days, and then you can come again, and perhaps your case will have been reached.'

"The Brooklyn man looked very disconsolate, but he loitered off a little ways and stood there, watching. After an interval there came a quiet moment, when there was a pause in the arrivals, and Peter looked out of his window

with no one to occupy him. At that moment the Brooklyn man gave three beautiful imitations of the crowing of a rooster. Peter's face flushed red. He beckoned to the Brooklyn man to draw near, and as he approached Peter opened the door. 'You can go in,' he said, 'but don't you ever crow again where I am.'

"Well," said the Colonel, "while that story may not be strictly straight at all points, it certainly corroborates, as far as it goes, other stories I have heard in representing Peter as still retaining a good share of his old human nature. Where there is so much smoke there must be some fire, and I like to think that it won't be all music up there, but that there will be some survival of individual sentiments and characteristics.

"It reminds me of an old army story I heard told on the plains in 1858, during what we called the Mormon War, which was no war, but only marching and camping. It was of a strange dream, narrated to the officers, mess one morning at Newport Barracks, Ky., by a Lieut. Brown, of the Sixth infantry. Brown dreamed that he had died, and he found himself ascending a long and narrow road, amid awful cliffs and crags, and almost borne along by a furious wind, which swept up the road and permitted no return.

"At last, numb and chilled, he came out upon a more open place, where, on opposite sides, stood two large office buildings, while the road beyond seemed to lose itself over a tremendous precipice into a boundless and bottomless gulf. Each building had a grated window, like a railroad ticket office, a single outside door, but without any outside knob or keyhole. Some dormant memory awoke in Brown's soul and turned his steps to the window on his right. A tall, stern and venerable, but well preserved man, with an indelible pencil in his hand, was seated at the window and looked out at him. Brown had never heard of X rays, but he described vividly how he felt the Venerable look through and through him.

"Who are you?" asked the Venerable.

"Lieut. B. B. Brown, Sixth infantry, from Newport Barracks."

"What! Sixth infantry, United States Army?" said Venerable.

"Yes, sir," said Brown, feeling a sort of misgiving.

"You impudent scoundrel!" said Venerable, laying down his indelible pencil and taking up a heavy round ruler, and growing red in the face. "What do you mean by trespassing on this side of that road? Clear out where you belong! And if ever you cross that road again I'll have you made stoker over there for a thousand years."

"Brown felt himself caught by the wind and fairly whirled out into the road, where it took him some time to recover his breath. He could not return down the path against the wind. He could hardly hold still against it, even though he laid down and clawed into the gravel. The precipice yawned in front of him, with the bottomless gulf beyond. He was chilled to the bone. He was lonesome. Gradually he became weary and desperate, and said to himself that he would rather be in Halifax. He crawled toward the window of the big building on the left. The wind whirled in that direction and helped him along.

"A little, smoke-colored gentleman smiled pleasantly at him through the grating. 'Good morning, sir. May I ask whom I have the pleasure of meeting?'

"Lieut. B. B. Brown, Sixth infantry, from Newport Barracks."

"United States Army?'

"Yes."

"Delighted to see you, sir," said Smoke-Color. 'Come right in, sir, and sit down, while I make out your papers. We are permitted to show that courtesy to the United States Army officers, while other people must wait their turns outside.'

"At that the door swung open and the draft seemed to suck Brown in.

"Take a chair, sir, by the fire," said Smoke-Color. 'Not too close, sir, just now, if you don't like. I will make out your papers for you, sir, immediately. So far as we are allowed we make special favorites of all United States Army officers.'

"He was awfully polite, and having seated Brown, he at once got down a big book, with Bro. on the back, and began to turn over the leaves. He did not seem to find what he wanted, and he asked Brown if he spelt his name with an 'e,' and then if he spelt it with a 'u.' And then he got down some more books and seemed to get very much bothered. At last, after looking back and forth for nearly a half hour he gave it up and said: 'Well, sir, I am very sorry, but there seems to have been some gross mistake somewhere! All the United States Army officers are conceded to us, and yet your name is not upon our books at all! I have looked them over exhaustively, and we have not got it. We would be delighted to take you in, and you would be warmly welcomed by every one of your preceding comrades; but there is a lot of red tape about this business, and we are held to a strict compliance with all formalities.'

"Well," said Brown, 'what am I to do? I can't get back, I can't hold on long outside, and the gentleman on the other side said he would give me a thousand years extra as stoker if I came on that side of the road again.'

"Bless my soul," said Smoke-Color. Then he reflected for a moment and said, 'There is but one thing I can suggest. That is Peter on duty over there now, and it is just like Peter to go off half-cocked like that. But it will be his lunch time soon, and while he goes to lunch Paul will be at the gate, and he is always civil and reasonable. We can always transact business with Paul. Meanwhile the old gentleman will be in very soon and he will take you over himself.'

"So Brown sat and waited, and polite little Smoke-Color sat down to talk with him, and there ensued quite a conversation, of which I have forgotten the detail, but to Brown's messmates, when he told them of the dream at breakfast, it was the most interesting part of the whole. For it was exceedingly personal, the polite little fellow displaying intimate knowledge of the pet moral frailties of each member of Brown's mess, and the most friendly solicitude that each was enjoying a good time and an easy conscience. Did Tom drink, and did Dick swear, and Harry gamble as much as ever? Brown had not been able to report any reformations, which was all very satisfactory to Smoke-Color, and he had said: 'That's all right! We need not send for them for a long time. Let

them enjoy themselves! Each one's example is worth something, and time is no object here.' All of which Brown set forth fully to his comrades.

"But in his dream, after awhile, the regular old gentleman himself came in. He was of somewhat lighter complexion—more of a toast color. He had extreme self-possession, and the most beautiful manners, combined with the air of a close student and a minute observer. But Brown could see that he meant business all the time. Smoke-Color introduced Brown, and explained the situation. Then he got down a book of regulations and showed the O. G. how every one concerned would lose his official position and be made stoker for eternity if they dared to take anybody in without authority from Peter or some other Apostle. So the O. G. agreed that the only thing to do was that he should take Brown over to Paul, for neither could Paul take Brown in without giving the O. G. a full hearing as to any claim he might be able to advance.

"At last Smoke-Color, after careful reconnaissance, reported that Peter had gone, and that Paul was at the gate. So the O. G. took Brown and went out. He left Brown holding on to the doorsteps, while he went across to Paul's window. After a few minutes' talk with Paul he beckoned to Brown to come over, and Paul opened the door and let them both in. Paul was taller than Peter, and his hair and beard were whiter. Peter's had seemed to retain a trace of having been auburn in his youth. They gave Brown a seat at one side, and then stood, with a table between them, facing each other. Paul spoke first and told the O. G. to state his claim against Brown, if he had any, or forever afterward to hold his peace.

"The O. G. answered that by some unfortunate chance Brown's name had been entirely left off the patent self-recording books. No direct evidence, therefore, existed against him. But it was admitted that he died in the United States Army. Although this was only circumstantial, yet it was the best evidence now obtainable, and was conclusive to any impartial mind. Under these circumstances his right to Brown was incontestable. To this Paul replied that Brown's case, being the first of its kind, would necessarily become a precedent, and would practically decide all future cases for untold ages. It concerned, therefore, more than Brown alone, and he was unwilling to bar out mercy for all eternity. Mercy must not be absolutely wanting even from the decrees of justice. The O. G. answered:

"I have acquired certain rights over all army officers by judicious expenditure of much time and trouble. You are bound to accord them some recognition. What do you propose to do about it?"

"Paul reflected a moment and said:

"Under such circumstances as these, the Patriarchs were accustomed to cast lots. I propose that we determine who shall take Brown by that device."

"Agreed," said the O. G. "That is fair. Get a dice-box and three dice. One throw each, and the highest takes him."

"Paul went to a bookcase and produced a dice-dox from a small drawer. As his back was turned the O. G. winked at Brown. The bookcase had a mirror in the door. Paul handed the box and dice to the O. G. He examined them for a moment, then put the dice in the box, rattled them and threw. The dice fell, three sixes! Paul replaced them in the box, rattled them and threw. Again three sixes! Neither spoke. The O. G. took up the dice, rattled them and threw. Three sixes! Paul took them, rattled and threw. Three sixes! Again neither spoke. The O. G. took them, rattled and threw. Three sixes! Paul took them, rattled and threw. Three sixes!! The O. G. gazed at them blankly, and his toast-color gradually deepened to a thunder-cloud black. 'Paul,' said he, 'I would not have believed it of you. Here you have gone and performed a miracle, and for what? To get an army officer into heaven, where he will be the worst lost soul in the whole universe! Paul, I'll never throw dice with you again. I thought this was to be a gentleman's game!'

"With that he snatched up his hat—it was a high beaver—clapped it on his head, stalked to the door without a word of good-bye to any one, and went out, slamming the door after him with a most tremendous bang!!

"It woke Brown up. It was the bang of the morning gun for reveille."

Natural History.

Snakes Swallow their Young.

PASADENA, Cal., Dec. 17.—*Editor Forest and Stream:* I have noticed lately several elaborate articles on snakes going the rounds of the press, written, I think, by a Mr. O'Reilly, though I may have forgotten the name. In any event, he is preaching the doctrine to the public that snakes do not swallow their young. I have always believed they do, not because I have seen it myself (though I have witnessed the act among fishes), but because I have known several persons of veracity who have. In this connection I inclose a letter, written me several years ago by the late Col. Nicolas Pike, of Brooklyn. I believe Col. Pike to have been a man of truth, and a trained and careful observer. He makes some very direct statements, and I should be glad to know how the opponents of the theory will endeavor to prove that he was mistaken.

SENOR X.

BROOKLYN, N. Y.—Dear Sir: There has been a controversy for years among naturalists relative to the question: Do snakes swallow their young? and there are many professors of herpetology at the present day who ridicule the idea. I have been cognizant of the fact for over fifty years. When a boy I began my studies in herpetology, and was not satisfied with knowing the names of our reptiles, but sought them in the fields and swamps and forests. I learned much of their habits, and from time to time kept them in confinement, and have reared many. Prof. G. Brown Goode, of the Smithsonian Institution, read a very interesting paper on the subject before the American Association for the

Advancement of Science, at Portland, Me., August, 1873, which ought to have settled the question.

The first time this came under my notice was in July, 1830. I was roaming over the fields, when I saw a good-sized garter snake (*Eutania sirtalis*) very near me, with numerous young ones around her. As I approached her, she placed her head flat on the ground, opening her mouth, and making a peculiar noise, the little ones evidently understood, for they all ran into her oesophagus. I picked her up by the neck and put her in a bag and took her home. On examination, I found I had about twenty snakes, including the mother. They were kept together in a box, and when I told the story to my friends they ridiculed me. It was not long, however, before every person in the house was convinced of the truth of my assertions, from witnessing the fact themselves.

I met with a curious incident some years ago while hunting snakes in the swamps at Melrose. I came across a male and female striped snake, with numerous young ones. The parents were near each other, the family crawling over and around them. I was going for them, when, on second thought, I concluded to watch them. They did not appear frightened, but went on gamboling about for some time. I went a little nearer, when both snakes turned toward me, making a faint noise, placed their heads flat on the ground and received the young as stated before. It was a curious sight to see these young snakes, not long born, some of them a foot or two away, turn at the noise, and instantly seek refuge. I am certain it was a note of warning of danger. I caught both snakes and put them in separate bags. The female had ten young and the male had swallowed five. This is the first instance of any notice of a male snake performing this affectionate duty for its young. I placed the whole family in a box, where they lived peaceably a long time.

Mr. Julian Hooper and myself encountered a large water snake (*G. sipedon*) on the banks of a small pond in Durham Swamp. I was about to capture her, when we saw a number of young entering her mouth, and before I could strike her she entered the pond. I immediately swept the pond with my net, and in two or three minutes captured her, but on examination could find no young. She had evidently in that short space of time deposited them under some tussock in the bank out of harm's way. What instinct for the preservation of her young!

I have also seen the *Eutania saurita*, *Heterodon platyrhinos*, and the *Crotalus horrida* perform this act for their young. Some rattlesnakes kept in confinement frequently did the same with their progeny when frightened. The beating of a drum near the case seemed to terrify the old ones, so that at the first tap they would secrete the young in the oesophagus, and vibrate their tails furiously, and they would not release the little ones till the noise ceased. I could relate numerous instances I have seen when different species of snakes have thus protected their young.

Certainly those who do not believe the fact must be closet naturalists and not students of nature. The fact is known to every farmer's boy of an inquiring mind. It is only a few years ago I satisfied a disbeliever by showing him a family of young snakes in confinement, bred by me. When he had witnessed the act he left me a firm believer. I was assured by a Portuguese naturalist in Rio that he had seen a number of the water snakes swallow their young, also a boa constrictor.

NICOLAS PIKE.

A Raccoon's Strategy.

RACCOONS are animals possessed of a great deal of cunning, but the trick played on Thursday night last by a coon in the possession of Major Sturm, of the Bellevue Hotel, beats the record. There are two show windows in the Market street end of the hotel; in one Mr. Coon has been holding forth for some time; in the other there is an aquarium with an assortment of fishes and aquatic flora. Both windows are screened from the inside, a small door in the screen about half-way up from the floor affording access to the windows. In some way or other Mr. Coon succeeded in unfastening the catch of his prison door, and thus he gained access to the café. His footprints indicated that he had taken an inventory of all to be found there. He had opened the catch of the door leading to the aquarium and had sampled the fish. He showed a preference for the double-tailed Japanese goldfish and the silverfish, for he had disposed of a number of these. He had sampled the Japanese water lilies, but these were evidently not to his liking. He had also taken a bite out of a tree toad, which had been in a state of semi-torpority for some time, but apparently did not like the flavor of the meat. Then he had retired, carefully closing the door after him; he went back to his own apartment and actually closed the door there after him. In the morning he was found wet as a drowned rat, but quietly sleeping in the top of the small tree which is his usual place during the day.—Paterson (N. J.) Chronicle.

The Service Berry.

IN THE FOREST AND STREAM for Jan. 21 Mr. Mather asks about the berry called service berry. It is what is known in different parts of the country as amelanchier, June berry, shad berry, wild pear, sugar pear, mountain whortleberry and other names. It is the fruit of the *Amelanchier canadensis*. Torrey and Gray reduce it to a single polymorphous species, but there are at least half a dozen varieties. One dwarf form found on high lands is only 3 to 4 ft. in height, with quite small berries; another variety, *botryapum*, reaches 30 ft. or more, with larger berries. The largest fruit I have ever seen grew on an island in a salt marsh on bushes about 6 ft. high, and the berries were a deep purple when ripe and fully as large as the end of one's little finger. It is said to grow in some form all over the United States, and as far north as Hudson Bay. It is called shad berry, from its being in bloom when the shad ascend the rivers. It is called June berry from the time its fruit ripens in some sections. It is called sugar pear and wild pear from the shape of the fruit, and amelanchier from the name given the *Amelan-*

chier in Savoy; but why called service berry is beyond my ken.

Col. Mather's wintergreen berry, commonly known here as checker berry, partridge berry and ivory plum or ivory-leaf plum, is the *Gaultheria procumbens* of the botanists, and a larger species, *G. shallon*, growing in Oregon, is the salal berry of the Indians. His berry, with the two eyes, called here twin plum berry and two-eyed berry, also called partridge berry, is the *Mitchella repens* of the botanists, and belongs to the madder family. Its sweetly scented flowers, born in pairs, are known here as the twin flowers. His bunch berry is here known by only this name, and is the *Cornus canadensis*, or dwarf cornel. The commonly called pigeon berries are the fruit of the poke or garget (*P. decandra*).

[The Century Dictionary gives "service-berry" as fruit of the *Amelanchier canadensis*; "service-tree," the *Pyrus* (*Sorbus*) *domestica* of Continental Europe; "service" as an extended form of "serve," the fruit of the service-tree; still back of this is "sorb," the fruit of the sorb tree of Europe, mentioned by Dante, in whose *Inferno* the trail abruptly ends. The summing up is that the American service berry received its name because of its resemblance to the serve, or sorb, of Europe.]

The Skunk's Defense.

To my mind there is not a more interesting animal in America than the skunk, certainly none more distinctive. The article by Prof. Rhoads, "Cross-Fires from a Skunk's Battery," reminded me of a case so much in point that I could not refrain from writing it up for the FOREST AND STREAM. It will be remembered that it was the woodsman's contention that the skunk was powerless when his flag was lowered, and that it could be killed with impunity by holding the tail down and striking it with a club. The experiments did not turn out well, and the naturalist suffered for his wanting to see the wheels go round.

In 1897, in September, at a farmhouse in the Levels, a polecat was discovered in the dairy, or, as we say, spring-house. This spring-house was full of milk, butter and all kinds of the most precious supplies for the winter. The polecat was acting like a gentleman, and the lady of the manor who found him there treated him as such. Like Poe's raven, his presence was the one disturbing feature, for if he should break loose the damage would be irreparable. The animal was left in undisturbed possession until the head of the household appeared. He was a good woodsman, and knew of the habits of the skunk. By a very gradual approach, he grasped the tail upflung and gently led it forth by the tail, holding it down, and brained the animal with a club when it was a sufficient distance away, and the spring-house was safe. There was a slight discharge of the secretion. This certainly is a practical application of the principles of science.

I was a long time learning that the common skunk is the Alaska sable of commerce. A few years ago a bill was introduced into the West Virginia Legislature protecting this animal on account of its insectivorous qualities, but it was defeated by the suggestion that if the bill became a law the session would be remembered as the "Polecat Legislature," and the measure died a natural death.

MARLINTON, W. Va.

ANDREW PRICE.

Crow Roosts.

Editor Forest and Stream:

In your issue of Jan. 21, Mr. Witmar Stone, of the Philadelphia Academy of Natural Science, in speaking of crow roosts, mentions several, and asks for information with regard to others.

For many years I have noticed a large evening flight of crows toward the woods to the south of Stockport, Columbia county, New York. They spend the day in an open and rolling moorland country about two miles to the east of their roost, and back from the river.

I was in the neighborhood during the holidays, and they seemed to be in greater numbers than ever.

WM. COFFIN DORNIN, JR.

Winter Robin in New York.

ALBANY, N. Y., Jan. 23.—Editor Forest and Stream: I hope to claim the honor of seeing the first robin of '99 in this vicinity. On Western avenue, yesterday (Sunday) afternoon, the writer heard the querulous "squeals" of a robin, and soon located the bird among the leafless branches of an elm on the south side of School No. 12. Robbie stood up confidently, but he wasn't singing a carol in the waning light of the sun, which was fast disappearing in a bank of gray, ominous-looking clouds in the southwest.

HORACE Z. DERBY.

Game Bag and Gun.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

Congress and the Game.

PHILADELPHIA, Pa., Jan. 20.—Editor Forest and Stream: The proposition now before Congress to enlarge the scope of the Fish Commission, so that it shall include game bird propagation and distribution, deserves a fuller and more careful consideration than the members of either House appear to be disposed to give to it. I beg opportunity in FOREST AND STREAM to call attention to some of the features of the measure.

Let us examine into the purposes of the bill in detail merely as it appears on its face, and subject it to a superficial analysis. An exhaustive analysis, with an exposition of the fallacies embodied in it, would fill a volume.

First, the duties and powers of the commission are to be enlarged so as to include "the propagation, distribution, transportation, introduction and restoration of game birds and other wild birds useful to man."

Let us begin with the propagation. How are the game

birds to be propagated? Some game birds will not breed at all in confinement. Fish can be grown by the million in a small hatchery. In the same amount of space, it is doubtful if a half-dozen wild birds could be raised. There is talk about aviaries, as if that were the sole expense, and the sole step necessary to success. Granted that there was an aviary in every township, how many quail or ruffed grouse, or woodcock, or snipe, could be raised in them?

The ruffed grouse is, from a practical standpoint, incapable of domestication. So with the quail, the snipe, the woodcock. If there was an aviary as large as the city of New York, it is doubtful if enough birds could be bred in it to be of any substantial use. The larger the aviary, the less are the chances of success.

The prairie chicken cannot be introduced in places it has already abandoned. Too much agriculture is as fatal to it as too much trapping and shooting. The breeding of game has already been tried, and proved to be a failure so far as it concerns American game birds.

Fishculture, where millions can be raised in a small area, and game culture, which is an impossibility, are quite different matters.

The Mongolian pheasant can be grown in captivity, but the failures even here far exceed the successes, and the care of one person is necessary to insure the growth of a few birds. The cost of growing any important number would be so great to the Government that it would necessarily force an abandonment of their cultivation.

How about growing wild ducks and geese? They are migratory birds, and therefore they could not be introduced anywhere with permanency.

How about the distribution of the birds? The answer is, How can they be distributed if there are none to distribute. Also, as each State has supreme control of its own game interests, as per the ruling of the Supreme Court in the Connecticut case some years ago, if there were really the game to distribute, it could not be distributed without the permission of the States interested.

Transportation of game? What game? If it cannot be bred it cannot be transported.

Introduction? Introduced where, and why? There is not a State in the Union but what has sufficient game stock to serve for breeding purposes if it were properly preserved. In such States as all shooting, trapping, selling, etc., were prohibited for a term of years, the game multiplied astonishingly. If the people of a State will not preserve its own game, how much the less will it preserve game sent into its borders, if it really were sent in, which is a matter of serious debate at an old lady's tea party.

Introduction? Introduce what, and where? It would be impossible, as Mr. Lacey proposes, to introduce prairie chickens into Kentucky, where it once swarmed in countless thousands. It would be impossible to introduce the ruffed grouse on the Kansas prairie. The prairie chicken could not live in New England. It might be an easy matter to raise woodcock, though the wise legislators should see that they are introduced into a sandy country, and make a bountiful appropriation for feeding them well on wheat and oats, so as to have the whole bill in keeping with its parts.

But, let us entertain the wild supposition for a moment that there was a big aviary in every township in America, and that the good legislators engaged only competent managers and assistants to superintend and care for each aviary. There may be a dozen persons more or less in the United States who have the practical knowledge as to how to breed woodcock, snipe, ruffed grouse, quail, etc., but we will assume that there are thousands. A sufficient number of birds are turned loose in every section to stock it. What protection have the birds so raised from the destruction of the poacher? You will pass a law prohibiting their destruction. To enforce that law would require an active number of game wardens in every township.

The people of Texas, moreover, would not care to be taxed for the maintenance of game wardens in New England, and the people of New England would not care to be taxed for the introduction of Mongolian pheasants into Texas. It would be a class matter throughout.

Fish in a general way can be introduced into the waters of the United States alike North and South, East and West. Not so with the birds. If the fish are exterminated in some waters, it is impossible for outside fish to get in and again restock them. The fish commission then is a necessity. Not so with the birds. A section may be completely stripped of its game birds, yet birds from outlying districts can come in and restock the exhausted section. No commission is needed.

There is no analogy whatever between the work of fish-culturists who really exist, and the work of game culturists who do not and cannot exist so far as practical results are worthy of consideration.

It would be impossible for the United States to establish a game warden system in any State. According to the decision of the Supreme Court, the State owns the game within its boundaries. The proposition that the State would tolerate any usurpation of its powers is not to be accepted for a moment. The history of the Government proves that the States are most jealous of their State rights. Any game turned out within the boundaries of a State would forthwith become the property of such State. It then would have only the same protection which was exercised in protecting the State's other game. If the people of a State would not take any interest or but a lukewarm interest in protecting its own game, it is not to be assumed that it would take more in protecting game turned loose within its limits. An order for 100,000 fish fry is easily filled. An order for 10,000 quail fry would be more than the Government aviaries could fill in a decade, if it relied on its own raising. If of ruffed grouse, then more than it could fill in a century. If a bird culturist received a salary of \$2,000 or more a year, and he succeeded in raising six ruffed grouse and a dozen quail, he would have done well; but with the expenses of the plant, and the current expenses from week to week, they would be worth about \$200 apiece at cost.

L. A. CHILDRRESS.

The Joke is Forgiven because of the Dollar that came with it.

Forest and Stream Pub. Co.: Kindly send me "Hitting vs. Missing," that I may cease the latter. By the way, why doesn't the author win the Grand American Handicap? You needn't answer if it is a trade secret.

J. W. HAMER.

The Home of the Moose.

In company with a party of friends, I spent twelve days at Lake Sourdnaunk (sometimes spelled Nesowadnaunk), the lower end of which is located in township 4, range 10. While there it was my good fortune not only to see, but to come into close contact with a large number of moose of various ages, sizes and stages of development. Lake Sourdnaunk is reached by buckboard from Patten, via Shin Ponds, Sebois, Grand Lake, and Trout Brook, a total distance of fifty-two miles, eleven miles of which is over a good road, twenty-one miles over a fair to bad tote road, and the remaining twenty miles over a road which is probably as rough as any in the State of Maine. The time consumed in taking the trip from Patten is just two and one-half days. We saw occasional moose tracks the second day out, but when within five miles of the lake the tracks became very numerous and were of various sizes, ranging from the spring calf up to the old bull.

A tramp over the numerous logging roads leading to the lake revealed the same state of affairs, many soft places having the appearance of a barnyard. Sourdnaunk Lake empties into Sourdnaunk Stream, and at the head of the stream there is an old dam, which has set the waters of the lake back among the timber, producing a lot of dead wood. This flooded district, which is perhaps half a mile long and 600 ft. wide, is known as the "thoroughfare," and is a favorite feeding ground for moose. A trip to the "thoroughfare," either in the evening or early morning, would always be rewarded by the sight of one or more of the big game. Our first trip was made in the evening, and as we silently paddled our canoes among the dead wood, we could hear the splashing of moose long before we were near enough to discern their outlines. We paddled up very close to a spike-horn bull, and passing him unobserved, we next saw a large cow and two calves. The cow was standing in about 3 ft. of water, and was feeding on the bottom. We watched her for at least ten minutes. She made a great deal of noise splashing about, and when she raised her head from the stream the water would run from her shoulders in torrents.

Further down the stream a bull we had not observed, but who evidently saw us, let out a bellow, and in an instant all the moose in the "thoroughfare" started for the shore, going through the dead wood with a tremendous crash.

One morning about 5 o'clock we took a trip to the "thoroughfare" and saw five moose, one young bull, three cows and one calf. Moose are easy to approach if one is careful not to let them get a scent. The cows especially would allow us to get very close to them, looking at us in a stupid, wondering way, and appearing like great overgrown mules. On another occasion we were there with two canoes, and as we entered we saw a large cow swimming the stream. We headed her off so as to prevent her landing, and brought our canoes very close to her on either side, when suddenly changing her course the bow of my canoe struck her on the hip, the point sliding very gracefully up her back, and nearly causing the canoe to capsize. By this time she was blowing pretty hard, and not wishing to injure her we allowed her to swim ashore. As previously explained, the place is filled with dead wood and fallen trees, but she went over and under all obstructions without the slightest difficulty. She encountered one fallen tree about the size of an ordinary telegraph pole which was too high to run over, and too low to go under. Putting her head under the tree, with a mighty effort she tossed it up in the air high enough to allow her to pass under in safety. The strength of the moose is prodigious.

One day we saw a very large bull and cow together, but were unable to get close to them. The Bangor & Aroostook Big Game Guide quotes Joe Francis, of the West Branch, as authority for the statement that the moose in his section of the country come around at night and look in at camp to see if the sportsmen are asleep. We had an experience one morning which quite eclipses Joe's facetious story. About 6 o'clock a young bull was seen in the lake about half a mile from camp. A hasty canoe trip brought us very close to his lordship, who did not seem at all disturbed by our presence. After looking at us a while he finally trotted off into the woods. An hour later, while at breakfast, as we were discussing our acquaintance of the early morning, the cook came running into the dining room with the statement that Mr. Moose was at our camp door. Of course, such a sight was not to be missed, and hurrying out, sure enough there the same moose stood beside the woodpile, less than ten rods from the camp. He remained there about three minutes, when he leisurely walked away, and the incident was forgotten until we were seated at dinner, when the cook again called to us, "That moose is out in the yard again." This time he was standing in the edge of the lake, about twelve rods from camp. He was a young bull with but four points. The velvet was hanging from his horns, which gave him an odd appearance. It is not often that a moose will present himself for inspection three times in one day.

About three miles from the lake, down the tote road, is a small body of water known as Dwelly Pond. This pond is a great feeding ground for moose, and one or more can be seen there any warm afternoon. On one occasion we saw three cows there. The pond has a soft bottom, and the moose seem to delight to wallow in the mud and water, and when they emerge they are literally plastered with mud, the bushes along the road being covered with mud left by the animals as the pass out. One mile from the lake is a smaller lake, known as Little Sourdnaunk. One day while we were on this lake casting for trout, a big bull moose walked into the lake within a few rods of our canoe. He was drinking very leisurely, when a flock of black ducks near by startled him and caused him to look in our direction, when he immediately bolted for the woods. In a few minutes another bull came down on the opposite side of the lake to drink. The writer saw sixteen moose while in this township, and another member of the party counted twenty-three. Of course it is possible that we saw the same animal more than once, but with the exception of the young bull that came into camp we do not know of any being seen the second time.

We certainly saw a great many different moose, and our experience convinced us that instead of being an extinct species, the moose is very much in evidence in the woods of northern Maine. We were there at the height

of the rutting season, and as the weather was very warm, we had exceptional opportunities for seeing moose in and about the water. In November they become scattered, and the unfortunate sportsmen who fail to secure a head will jump at the conclusion that moose in Maine are a thing of the past. A very comfortable camp is located on the east shore of the lake, owned by McLain & Hall, who are thorough woodsmen and reliable guides. Eight moose were killed in this section during the season of '97, six being taken out whole to Patten, and two heads going out via the West Branch to Norcross.

On the morning of Sept. 29, while at Trout Brook Farm, township 6, range 9, I saw a very large bull moose. We were hunting grouse up the old logging road leading to Cunningham's camps, when a sudden turn in the road brought us almost face to face with the largest bull moose I have ever seen. He did not see us until within a few rods of where we stood. He was coming slowly down the road with his head low down when he discovered us. He appeared astonished at first, but gradually straightened himself up, and finally threw his head high in the air, until it appeared as though he would never stop. He presented a magnificent sight, with his spread of antlers touching the overhanging boughs, and occupying the entire road, his possession of which we were not disposed to dispute. He appeared to be about 8 ft. high at the shoulders, while his head and antlers added at least 3 ft. more to his towering form. He had a fine head, with a spread of antlers of at least 5 ft., with considerably more than twenty points. As he loomed up before us in all his majesty, he looked indeed the monarch of the forest. We naturally experienced a feeling of uncertainty as to what his next move would be, and were considerably relieved when at the end of about one minute he suddenly turned and trotted up the road. That this was an exceptionally large moose there can be no question. Of course the dimensions I have given are merely a matter of opinion hastily formed, but I believe my estimates to be conservative. Had this been my first sight of a moose I might admit that the suddenness of his appearance had produced a distorted imagination, which had greatly increased in size in my estimation, but as this was the seventeenth moose I had seen within a period of two weeks, I believe I was capable of forming a correct estimate. We followed his trail for nearly half a mile, when he left the road, and we lost his track. His enormous weight was indicated by the unusually deep imprints he made in soft places. I measured one clear impression of his hoof, and it was $7\frac{1}{4}$ in. long and 6 in. wide. This imprint was afterward examined by Wm. Currens, the genial proprietor of Trout Brook Farm, who said he had never seen a larger hoof. Mr. Currens has been in the woods for many years, and has a good knowledge of the animal. We found moose tracks very numerous in this township, especially along Boody Brook, and the East Branch of the Penobscot, between Grand and Second lakes. Our party went into camp for the purpose of fishing, and remained over into October, long enough to secure a deer, but on account of our unusual good fortune in seeing so many moose we were more than repaid for the trip.

NEW HAVEN, Conn., Jan. 15.

GEO. W. LEWIS.

Boone and Crockett Club Meeting.

THE annual meeting of the Boone and Crockett Club was held Saturday, Jan. 21, at the Metropolitan Club, New York. At 7 o'clock the following members were present: Major George S. Anderson, U. S. A.; F. S. Billings, W. B. Bristow, D. M. Barringer, R. P. Carroll, J. L. Cadwalader, E. W. Davis, W. K. Draper, W. B. Devereux, C. S. Davison, D. G. Elliot, George B. Grinnell, W. M. Grinnell, Madison Grant, De Forest Grant, J. T. Gardiner, Frank Lyman, Dr. Alexander Lambert, Osmun Latrobe, C. G. La Farge, Dr. L. R. Morris, Prof. H. F. Osborn, J. J. Pierrepont, A. P. Proctor, Thomas Paton, P. R. Payne, Gifford Pinchot, Douglas Robinson, Governor Theodore Roosevelt, J. E. Roosevelt, Elihu Root, Dr. John Rogers, Jr., Dean Sage, Alden Sampson, H. L. Stimson, J. L. Seward, W. A. Wadsworth, J. S. Watson, Charles E. Whitehead, Caspar Whitney and Gen. W. D. Whipple.

The following officers were elected for the coming year: President, W. A. Wadsworth, Geneseo, N. Y.; Vice-Presidents, Chas. F. Deering, Illinois; W. B. Devereux, Colorado; Howard Melville Hanna, Ohio; Wm. D. Pickett, Wyoming; Frank Thompson, Pennsylvania; Secretary and Treasurer, C. Grant La Farge, New York. Executive Committee, Winthrop Chanler, Chairman; Lewis R. Morris, A. Rogers, Henry L. Stimson, Madison Grant; Editorial Committee, Geo. Bird Brinnell, Theodore Roosevelt. The two vacancies in the membership of the club were filled by the election of Hon. W. K. Townsend, New Haven, Conn., and Geo. Bleistein, N. Y.

The meeting was followed by a dinner, after which Prof. Henry F. Osborn, of the American Museum of Natural History, delivered an address, illustrated by lantern slides, on the ancient game of North America. This account was most happily told in an entirely untechnical and popular way. It was the story of a supposed trip taken by the speaker, with two companions from New York, westward over the land and sea of what is now the American continent, as far as the Rocky Mountains. The journey began in Jurassic time, and the huge Dinosaurs of that period were described and pictured on the screen. Their extinction was explained by the destruction of their eggs by the small mammals, which made their appearance and were numerous during the later Jurassic. The progress of higher life in the West was sketched, and various types, important either for their extraordinary characters or as being the ancestors of existing types, were described and shown on the screen down as far as middle tertiary time. Thus the trip lasted some millions of years. The address was extremely effective, and was listened to with the greatest interest.

Among the informal speeches made later in the evening was one by Governor Roosevelt, in which he gave an interesting account of the Rough Riders and their work in Cuba. The regiment contained men of most diverse occupations and characters, and the manner in which these types, which differed so widely in the circumstances and surroundings of their earlier life, assimilated is a

striking feature of the good service which they performed, and indeed is what made that good service possible. Short addresses were made by other members of the club.

The Maine License Proposition.

BOSTON, Jan. 21.—Quail shooting in the South is a thing much talked about by Boston gunners just now, and some of them have the good fortune to be able to go to some favorite Southern preserve for a couple of weeks or more. Mr. Peter B. Bradley, Mr. A. W. Steadman and Mr. H. S. Mann have been absent for a couple of weeks on a hunting trip. They are on Mr. Bradley's preserve at Stono, S. C. They took their own dogs, as well as guns and camping outfits. Duck shooting, as well as quail, is one of the features. Mr. Harry B. Moore, of Boston, and Mr. George C. Moore, of North Chalmersford, Mass., left Friday evening for Hickory, N. C. They are to meet Dr. French, a well-known Boston gunner, there. They expect both quail and wild turkeys in fair abundance, though they are not sportsmen who would tolerate for a moment the shooting of quail for count.

It seems that the proposition to make hunters buy a license to hunt big game in Maine is meeting with a storm of opposition, notwithstanding the Governor recommends as much and Commissioner Carleton is very pronounced in its favor. It is certain that the railroads are lending their influence strongly against such a measure, aided by all the transportation and express people. The Rangeley Lakes section of the country will fight the measure, through their representative, while a strong delegation from Aroostook county will appear against it. What the result will be it is too early to predict. Boston big game hunters are decidedly against such a license law, though they will make no movement against it, lest they be accused of mercenary motives. The general expression I have heard is one of disfavor, accompanied by the assertion that the mere chance of securing big game in Maine costs too much already. Besides, the idea of a license system is distasteful to the notions of gunners who visit Maine. "Charge us more for guides, board, or transportation; make us contribute to a fish and game protective fund, anything—only don't force us to take out licenses. We want no part of such a system, and if Maine adopts it we can go to the provinces, where such a system is already in vogue. Heretofore we have been to Maine by reason of the free hunting there. Change to a license system in Maine, and we can easily choose the provinces for our hunting." SPECIAL.

MONSON, Me., Jan. 20.—*Editor Forest and Stream:* I note your editorial in FOREST AND STREAM of Jan. 14 upon "Game Protection a Public Concern," and I agree with you to a certain extent. I am, however, utterly opposed to the proposed scheme or any other that will impose a tax upon either hunters or fishers, whether residents or non-residents.

It is un-American in conception and character, and it seems to me will be repulsive to every one who comes to the Maine woods to enjoy the sports that nature has provided for them.

The non-residents with few exceptions are paying out large amounts each year to the people of Maine. This money goes into circulation through the guides, the hotels, the hotel employees, the railroads and steamboats, and the farmers who sell produce to this great army of sportsmen, guides and employees.

The State appropriates only \$25,000 for warden service and the propagation of fish, but yet this appropriation is doing great good, and while it is too small, it will preserve the game for the present at least.

During the past two years a few demagogues in our State have been making efforts to create a prejudice among the farmers of Maine against the fish and game interests. The consequence is that there is some slight friction between the two. This condition has intimidated some of our best sportsmen, and they are now seriously considering the feasibility of adopting a license tax system "to make the industry self-sustaining." I believe the plan is fraught with evil and danger, besides it is entirely unnecessary, for the State of Maine can well afford to do all that it is doing and much more for the fish and game interests. It is the best investment that the State makes in the way of appropriations. If you or any of your readers entertain any views in opposition to this scheme, now is the time to express them.

J. F. SPRAGUE.

Game Protector Beede.

KEENE VALLEY, Essex County, N. Y.—*Editor Forest and Stream:* In a recent issue of the FOREST AND STREAM appeared an article without verification, and therefore anonymous, under the heading, "Present Deer Law Is Useless." Contained in the said article were statements reflecting on the undersigned, and the performance of his duties of game protector.

These statements have no doubt been made by some violator of the game law who has been punished by the undersigned for such violation, and who now thinks to secure petty revenge, and possibly a little cheap notoriety, by having published anonymously statements which are both false and malicious, and which cannot be substantiated or proven.

F. S. BEEDE, Game Protector.

Wants Aid against the Foxes.

ALTOONA, Pa.—*Editor Forest and Stream:* Will some one experienced in trapping foxes kindly write the undersigned, giving such information as may assist a number of our club members in their war against Reynard in this section? The foxes have become so plentiful in some localities that the propagation of game is a useless undertaking. There is no fox chasing, for the reason that the country is too rough, and this prowler of the forest has things quite his own way. Our club is the Altoona Rod and Gun Club, and Blair County Game and Fish Protection Association, Altoona, Pa. G. G. ZETH, Sec'y.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

List of the Western Forest Reserves.

So much has been said backward and forward in the newspapers about the forest timber land reservations of the West, and yet so little is known about their location and extent, that it seems well to print in FOREST AND STREAM a map of the country from the Mississippi River to the Pacific Coast showing the relative positions and sizes of the forest reservations, as well as a table giving the name, location, date of establishment, and estimated acreage of each. Besides these timber land reservations, there are also the National Parks, aggregating something more than 5,000 square miles of territory. The materials for this enumeration are taken from the land office statements in the last report of the Secretary of the Interior. On the map the forest reserves are black; the National Parks the white numbered areas adjacent to the black forest reserves.

Notwithstanding all the hostility to this subject which was felt in the West, and to which we have so often referred, the work of setting aside the forests has continued during the past year, the importance of the subject being such as to impress itself on all intelligent men. Two new reservations, embracing more than 1,650,000 acres, have been established, and the boundaries of one or more existing reservations have been enlarged. Serious efforts are being made to carry out the laws and the regulations that have been established, but as to almost all our officials in Washington and elsewhere this is entirely new business, the work of carrying it forward intelligently is difficult and slow. At the same time, the work is going forward more rapidly than could have been hoped, and a better understanding of forest preservation is leading people everywhere to take more and more interest in the subject. There is no doubt need for additional legislation with regard to our forests, but even more important than this is the need that the persons employed in forestry work should be of high character and thoroughly interested in the subject.

CHICAGO AND THE WEST.

Michigan State Game and Fish Protective League.

LANSING, Mich., Jan. 18.—If the wishes and deliberations of the Michigan State Game and Fish Protective League be respected by the State Legislature, Michigan will cut forty-four pages out of her fish laws as they now stand printed, and will charge non-residents a license fee of \$25 for shooting any sort of game within the borders of that State. This is the gist of the meeting of the League, which concluded its session at midnight of yesterday.

Two years ago the game laws of Michigan were incumbered by a mass of local acts, contradictory clauses and the general accumulation of years of haphazard legislation. This same League took the matter in hand, suggested that the rubbish be cut out and modern enactments be made instead. In general, the wishes of the League were respected. The result may be seen in the admirable game law which now stands on the statute books of Michigan.

It became evident this year that if the officers of the State were to carry on their work intelligently under the fish laws, there must be a general remodeling of those laws. Accordingly the call was issued on the 20th of last December for the meeting which was held in this city yesterday. The work of the meeting was careful and well considered, and provided that the game and fish committee of the present session of the Michigan Legislature shall listen to the council of the best posted men of the State on such matters, Michigan will have fish laws as good as her game laws.

The Machinery of the Law.

The pretty city of Lansing is full of bustle these days, the State Legislature being in session. Part of the morning was spent by the visiting members of the League in the galleries at the State House, where the machinery of the law might be seen in full operation. The building was full of public men, and one could gain a very good notion of the way laws are made, and get also some conception of the distance there lies between the wishes of

the sportsmen and the written page upon the statutes of the commonwealth.

Busy about the State House, striding from one room to another with all the energy of a steam-fed machine, there might be seen Chase S. Osborn, State game and fish warden, whose record for the past two years has been an extraordinary one, and whose enthusiasm and executive energy are not likely soon to be duplicated. Warden Osborn, as I learned, has had offered to him the renewal of his appointment to the office of State warden. Governor Pingree could not find a better man. Warden Osborn has been well seconded by his State deputy, Charles E. Brewster, secretary of this League. Mr. Brewster also knows a great many of the public men of the State, and has a good record of nearly a straight string of convictions. The office of State warden during this year shows the remarkable results of 1,096 arrests and 876 convictions, far and away the record of the United States on the legal side of protective work. With this showing and with the splendid machinery which Warden Osborn has put in force, the State of Michigan has much cause of self-gratulation. It is to be hoped she will still further improve her operating machinery by the adoption of the suggestions of this League in the matter of fish laws.

Those Present.

The following were among those present at the sessions of yesterday morning and evening:

Hon. Chase S. Osborn, State Game and Fish Warden, Sault Ste. Marie; Chas. E. Brewster, Secretary, Grand Rapids; A. L. Lakey, President, Kalamazoo; Ed. Carpenter, Deputy Warden, Saginaw; G. W. Willis, Deputy Warden, Bay City; W. A. Palmer, Deputy Warden, Buchanan; Frank A. Rodgers, Prosecuting Attorney, Grand Rapids; Geo. H. Blackmar, Grand Rapids; A. N. Henne, Grand Rapids; G. Henry Sheara, Bay City; Hon. F. C. Chamberlain, Ironwood, Mich., member Interstate Game Commission, and Representative in Legislature; Ed. H. Gillman, President Turtle Lake Fishing and Shooting Club; Judge S. L. Vance, Port Huron; Hon. C. E. Foote, Kalamazoo; Jay Pearsall, Lansing; Hon. H. K. Gustin, Alpena; Hon. Dennis Baumgaertner, Saginaw; V. Kindler, Saginaw; John O'Neal, Charlevoix; D. M. Estey, Owasso; Judge S. B. Daboll, St. Johns; Mich.; O. B. Estey, Owasso, Mich.; Josiah Hill, Pontiac; D. G. Henry, Deputy Game Warden, Grand Rapids; L. Whitney Watkins, Manchester; W. B. Rosevear, Saginaw.

During the evening session there were present Chairman Anderson, of the game and fish committee in the House. Mr. Anderson comes from Grand Rapids, which is to say he is well grounded in protective matters. Representative Gustin, of Alpena, was also present, another member of the committee, and another man who is modern in his ideas of protection. Representative Blakesley, of Berrien county; Representative John Carton, of Flint; ex-Speaker Tateum, of Grand Rapids, and others of prominence in State political circles attended the evening session. Governor Pingree promised to attend, but failed to do so. The committee appointed to invite the Governor was composed of Warden Osborn, Judge Daboll, of St. Johns, and Ed. H. Gillman, of Detroit.

Afternoon Session.

President A. L. Lakey, of Kalamazoo, called the afternoon session to order at 2 P. M. Secretary Brewster was at the desk, and read the call for the fifth annual meeting of the League. The routine matters of credentials, minutes of last meeting, etc., were rapidly run off, and

a working committee or two appointed. The meeting of the evening was referred to as being of greatest importance, and not much actual business was transacted at the first session. Mr. Brewster and Mr. Rodgers, the latter prosecuting attorney of Kent county, stated that they came, instructed by the sportsmen of Grand Rapids to take the position that the game laws should be left as they are, and that no changes should be attempted for fear of disastrous results. President Lakey offered for reading his address, which was pithy and to the point. One sentence from it was as follows: "Wise legislation is always for the future as much as for the present." This is certainly good doctrine and worth bearing in mind. Mr. Lakey wished spring shooting to be prohibited as it now stands. He did not think there should be any shooting of snipe in the spring, or of woodcock in August. He thought that the deer season should begin Nov. 1 and close Nov. 20, and that the hunter should be limited to three deer in any one season. He believed in a general shooting license for residents and non-residents. He referred in complimentary terms to the Chicago interstate meeting of wardens, and the bill drafted there, a copy of which was shown. Mr. Lakey's address was received with appropriate and just applause. Mr. Rodgers moved that copies be made for the use of the legislative committee, and this was ordered.

A Small Split.

A little split in the meeting was threatened when Judge Daboll, of St. Johns, tall, positive and energetic, rose to take issue with the Grand Rapids members, and to insist on changes in the game laws. Judge Daboll said that the meeting ought to know its own mind before it went before the legislative committee, at the same time he was not satisfied to take instructions from Grand Rapids. He said we must have progress in game laws, and be willing to fight, and not be too much afraid of losing what we have. He moved that the game law be amended so that the deer season should be Nov. 1 to Nov. 20. Mr. Gillman seconded this. Mr. Brewster moved to amend by inserting section 18 of the interstate bill in full, the dates to be Nov. 1-20, the limit three deer, with five days off each end of the season before selling season. This motion was carried as amended.

Mr. Rodgers said he was disposed to wait until other States had passed this bill. "Let us not endanger our present law," he said. Judge Daboll said in reply: "I represent a large element, and I want to say that you cannot evade this fight, no matter what the instructions from Grand Rapids may be. I want a shorter season and an earlier season, so that hunters can kill fewer deer, and not more." Representative Harry Gustin, of Alpena, said he thought the date of Nov. 1-20 was all right. Warden Osborn, in his impulsive, nervous style, said that he believed in progressive protection. He admired the conservatism of Grand Rapids, but wanted to see progress. Michigan already had the best game laws of any of the Western States, but they might be still better. Some one made reference to the now famous remark of Mr. Foote, of Kalamazoo, who stated that he could never approve of cutting down the limit from five deer to three deer, since no one could go out hunting and pay expenses if he got less than five deer. Mr. Foote got the very appropriate and general roasting he deserved.

On motion of Mr. Willis, of Bay City, a committee of five was appointed to draft a general fish bill to be presented at the evening session, said committee being C. E. Brewster, chairman; A. L. Lakey, Judge S. B. Daboll, Messrs. O. B. Estey and Frank Rodgers. Adjournment was then had.

The Evening Session.

The evening session was well attended and business-like. Mr. Frank Rodgers, of Grand Rapids, cut short the discussion of game laws by offering the following motion: Resolved, That the League recommend to the Legislature of this State that the game laws be amended so as to correspond to the recommendations of the Interstate League, held in Chicago in February, 1898. And we further recommend that no other changes be made in the game laws of this State." Mr. Rodgers said that he thought this would reconcile and conciliate all parties. The resolution was carried with a rush. If Michigan shall pass this measure she will certainly have done all that can be asked. The text of this bill has been printed in *FOREST AND STREAM* before now. It is the consensus of the best thought on these matters by the best men of Michigan, Wisconsin, Minnesota and Illinois.

This left future action to be on the fish laws alone, and the rest of the evening was left to the discussion of the bill drafted by the committee, which was taken up section by section. The action was somewhat complicated, and the matter eliminated from the present statutes very extensive indeed. I know of no better way to present the meat of this discussion than to give a synopsis of the measures recommended, showing the new sections proposed, and certain of those of the old statutes which are thought proper to be retained. This synopsis follows and may be understood to represent the sense of the meeting in the matter of fish laws. The amount of useless, senseless and cumbersome local legislation which is thus cut out is something enormous. The proposed law will be seen to be broad, general and modern, as see below:

Section 1. The People of the State of Michigan enact, That no person shall catch or take from any lake, river or stream of this State, by any means whatever, any speckled trout, landlocked salmon, grayling or California trout, from the first day of September in each year until the first day of May following thereafter; nor shall any person catch or take any muskallonge, or any black, strawberry, green or white bass, by any means whatever, except by hook and line, from any such lake, river or stream, from the first day of March in each year to the first of July following thereafter. It shall be lawful for the State Board of Fish Commissioners to give permits in writing to any person to catch or take any such fish at such time and in such manner as they shall direct, for the purposes of propagation; but in case of any prosecutions for a violation of any of the provisions of this section, such permission must be shown affirmatively by the defendant. (a)

Sec. 2. No person shall knowingly purchase, buy or sell, or attempt to purchase, buy or sell, any of the kinds of fish named in the foregoing section during the respective prohibited periods above named.

Sec. 3. It shall not be lawful hereafter at any time to kill or destroy, or attempt to kill or destroy, any fish in any of the waters of the State of Michigan by the use or aid of dynamite, herculean or giant powder, or any other explosive substance or combination of substances, or by the use of Indian cockle or other substance or device which has a tendency to stupefy the fish.

Sec. 4. Prohibits any device, except hook and line, in any of the inland waters of the State, except dip nets may be used for catching mullet, grass pike, red sides and suckers in streams not planted by the State.

That the use of the spear is allowed during the months of October and November, except to the catching of trout, grayling, black bass, wall-eyed pike, muskallonge and white bass. (Adopted as read and recommended.)

Sec. 5 makes it unlawful to deposit any saw dust or filth of any description in any of the inland waters of the State. (Adopted as read.)

Sec. 6. It shall be unlawful for any person or persons to take, catch or kill, at any time, any speckled or brook trout, German trout, California trout, landlocked salmon, or grayling, or any black, strawberry, green or white bass, in any manner whatever, except by hook and line, in any waters of this State.

Sec. 7. It shall be unlawful for any person or persons to kill or capture, in any manner whatever, in any of the waters of this State, or to have in possession, any brook trout, speckled trout, California trout, landlocked salmon or grayling, of a less size than seven inches in length.

Sec. 8. Hereafter it shall not be lawful for any person or persons to take or catch, by any means whatsoever, any brook trout, grayling or California trout from any stream in which brook trout, grayling or California trout are not native, and which may have been stocked with such fish by the State Board of Fish Commissioners for the period of three years after the first planting of any such fish therein.

Sec. 9 prohibits the sale of brook trout, grayling, and black and green bass. (Adopted as recommended.)

Sec. 10. It shall be unlawful for any person or persons to kill or take speckled trout or other fish from any private waters used for the propagation of such fish, except by the consent of the proprietor of such private waters. It shall be the duty of the proprietors of any such private waters who are engaged in the propagation of fish as contemplated by this section to post or cause to be posted in a conspicuous manner public notices painted on boards in large and plain letters that the owner (naming him) is engaged in such business and warning all persons from killing or taking any fish in the waters named in such notices.

Sec. 11. It shall be unlawful, at any time hereafter, to take, catch or kill or destroy, or attempt to take, catch or kill or destroy any minnows or small fry fish in any of the waters of this State, for other purposes than for fish bait.

Sec. 12 prohibits fishing within 400ft. of any dam. (Adopted as read.)

Sec. 13. It shall not be lawful for any person or persons to place a weir dam, fish weir, weir net or other device, across any race, stream, lake or river of this State, in such a manner as to obstruct the free passage of fish up and down the same; and any person violating this section shall in addition to the penalty provided for in Section 14 of this act, be liable to the payment of two dollars per day for every day that he shall continue such violation after having been duly notified by an elector of the township wherein such fish weir or weir net may be, feeling himself aggrieved thereby, to remove the same, said penalty or penalties to be recovered before any court of competent jurisdiction in the township or county where such offense shall have been committed; and in default of payment thereof, shall be confined in the county jail until such fine and costs shall be paid; but such confinement shall not exceed thirty days.

Secs. 14 and 15. (Concurrent with Interstate bill, Sec. 3.) It shall be unlawful, and is prohibited, to take, catch or kill, or have in possession, or offer for sale, any fish of the following varieties of less length than herein specified: Black bass, 10in.; perch, 7in.; white, striped or rock bass, 6in.; catfish, 12in.; black, river or white crappie, 8in.; wall-eyed pike, 12in.; pike or pickerel, 18in.; brook trout, California or rainbow trout, or any other variety of trout except lake trout, 6in.

Penalty.

First Offense—Fined not less than \$10 or more than \$100, or imprisonment in the county jail not to exceed ninety days, or both. (Adopted as recommended.)

Second or any Subsequent Offense—Fined not less than \$25 nor more than \$150, or imprisonment in county jail or State prison not to exceed one year, or both. (Adopted as recommended.)

Repealing Clause.

All acts and parts of acts inconsistent with any of the provisions contained in the foregoing act, except special acts applying to inland lakes in certain counties in this State, are hereby repealed.

Sec. 15. An act to provide for the erection and maintenance of fish ladders in all dams in this State, under the direction of State game and fish warden. (Adopted as proposed.)

Sec. 16. (Local measure not changed.) That it shall not be lawful hereafter to take or catch any fish in the lake known as Reed's Lake or the lake known as Fisk's Lake, in the township of Grand Rapids, in the county of Kent, with the spear or by shooting them with any firearms.

It shall not be lawful to fish in Reed's Lake or Fisk's Lake, or either of them in any manner, or to take and remove any fish there-

from in any manner, at any time during the months of October, November, December, January, February, March and April in any year.

Sec. 17. (Local measure amended.) That it shall not be lawful to take or catch, by any means whatsoever, any species of bass in Walloon Lake, or Bear Lake, so called, from the fifteenth day of April in each year to the twelfth day of July next succeeding.

Discussion of the Evening.

Deputy D. G. Henry, of Grand Rapids, thought bass should be protected during the spawning season, from Jan. 1 to July 1. Mr. A. R. Avery, of Port Huron, a prominent lawyer, and a keen thinker, said he thought bass did not need any protection from hook and line fishing, but only from spears and set lines. Mr. Nicholls, of Lansing, believed in coming out absolutely against all spearing whatever. Mr. Brewster said he was afraid of antagonizing the farmers. Mr. Lakey said that spearing could not be repealed unless something were traded for it. "In Sec. 4 we trade winter months for months where there is no ice," he said, "and we think this is a good trade." Mr. Coulter, of Charlevoix, thought there were too many kid glove laws already, and that Mr. Brewster was right. The Nicholls amendment proposed was lost. Spearing will be allowed in the months of November and December.

Mr. Willis, of Bay City, made a strong talk to except the Saginaw River from the netting clause. Mr. Willis is a warden, but also a fisherman. He said that no very great amount of black bass were taken in nets there. Mr. Willis offered an amendment exempting his river, but it was defeated.

On pollution of streams, Mr. Willis said: "We will have all the big factories to fight." Mr. Brewster said: "If the factories are bigger than the State of Michigan, let us fight them. New Jersey is sending all its factories to Michigan to ruin Michigan streams." Deputy Palmer, of Buchanan, showed how the mills at Niles and Water-vliet had ruined the streams. Section carried.

On the matter of length of brook trout, the local act again showed its head. Mr. Avery wanted an 8in. limit set for the Au Sable River. Mr. Coulter thought a 7in. limit would be good for the Jordan River and its tributaries, this being in his part of the State. Mr. Brewster contended against this local legislation. A general 7in. limit was adopted. Mr. Avery said that the books all stated that a 6in. trout had spawned once. He was satisfied these books were wrong, and that in Michigan a trout must have attained a length of 7 or 8in. before it spawned.

Sec. 9, stopping the sale of black bass, is a step toward the Platform Plank of *FOREST AND STREAM*, and it is a good one. Minnesota put the ban on marketing black bass some time ago. Sec. 12 is Commissioner Nat Cohen's pet idea in Illinois, prohibiting fishing near a dam.

The question of penalty was well discussed, this bringing up the question whether it would be best to bring fish cases before justices of the peace or the circuit courts. Mr. Avery, Mr. Brewster and Mr. Rodgers all spoke on this. Penalty was set for first offense \$100, second offense \$125, the latter taking it into the circuit court. This action seems wise.

On the question of fishways, Mr. Avery said he doubted whether a black bass ever ascended a fishway. It was pointed out that perhaps the fishway was not well constructed. The recommendation was carried.

The president of the Grand Rapids Street Car Company had sent in a letter asking that the protection of two little lakes near Grand Rapids be continued (Reed and Fish lakes), so that they be not fished out. This local measure passed over adverse comment of Mr. Willis.

Discussion on the last half of Sec. 1, open season on bass, was deferred until late in the evening. Mr. Coulter was opposed to taking bass in the spawning season. Mr. Avery moved to protect bass from Nov. 1 to July 1. Warden Carpenter, of Saginaw, said that the date of July 1 could not be enforced, that 3,000 Saginaw fishers would break it every Sunday. Mr. Henry moved to amend by protecting bass from Jan. 1 to July 1. The amendment was carried, but the Avery motion was lost. The old date stands unchanged.

Addresses.

Midway in the meeting addresses were called for by prominent men present. Chairman Anderson, of the house committee, said the measures suggested would have his hearty support. Mr. Carton said that the League men knew more about protection than he did, and that he would rely upon them. Mr. Gustin said he believed in protection, but not too much of it. Mr. Tateum said he would endorse any action the League took. Mr. Stanton, of Grand Rapids, thought something ought to be done to destroy the natural enemies of trout.

Sizes of Fish.

The Interstate recommendations on legal limit for different species of fish were adopted in general, the Michigan new limits being embodied in the above synopsis. This practically ended the fish work of the evening.

Sweeping License Laws.

Now came some of the most interesting work of the entire session, that on the question of shooting licenses. The interstate bill was read on this head. Mr. Brewster said that this interstate measure could not be passed in Michigan. Mr. Gustin said that the license act ought to be brought in separately, and not be made a part of the bill, else it would jeopardize the whole. Mr. Rodgers, of Grand Rapids, said that he liked this license clause, for it meant revenue. He thought the League should endorse it. Mr. Avery thought that fishing licenses were just as legitimate as shooting licenses. Mr. Lakey's views on a general gun license are well known, and he seemed to have followers enough. Mr. Rodgers moved that a general shooting license be recommended, of \$1 for resident shooters and \$25 for non-resident, this to apply to shooting for all kinds of game. Mr. Brewster, seeing the inevitable coming, moved to amend by allowing any holder of a non-resident deer license to take home with him one deer, owner to accompany same. This amendment carried, and so also, without much fuss, did the motion, which was really the most radical action of the meeting, and that most nearly approaching the impossible.

Conservative public men tell me there is little chance of this becoming a law. Should it do so, it will be the last step in the strong recent tendency in Western States toward the license idea.

Appropriations.

Mr. Rodgers offered this resolution: "That the sum of \$2,000 appropriated by the State of Michigan for the purposes of game protection is wholly inadequate, and that the Legislature be requested to increase same to a proper amount." Mr. Rodgers went on to show the expense and difficulty of the work in prosecuting game cases (in which work, by the way, it may be stated that Mr. Rodgers has contributed to the interests of sportsmanship a vast amount of his own valuable time, he having traveled far and wide and given his services free). Mr. Gustin pointed out that the game warden had other funds available, and Mr. Brewster explained that the warden had had \$4,600 added to the sinews of war from out the State license funds, outside certain county funds, which had also been employed. The State warden had secured \$14,000 in fines. The Rodgers motion carried. Deputy Palmer said he had once secured \$400 in fines in Cass county, but had only got \$28 for his work.

Election of Officers.

The following officers were elected for the Michigan League for the ensuing year: Mr. A. L. Lakey, of Kalamazoo, the present efficient president, was continued in office, and as much was done for the hustling secretary, Mr. C. E. Brewster, of Grand Rapids. Mr. A. R. Avery, of Port Huron, was chosen Vice-President; Judge S. B. Daboll, of St. Johns, Treasurer. The executive committee is to be composed of the above officers, with addition of Messrs. Frank Rodgers, of Grand Rapids; A. L. Coulter, of Charlevoix; D. G. Henry, of Grand Rapids. All the voting was done by one ballot of the secretary. Messrs. Rodgers, of Grand Rapids; Brewster, of Grand Rapids, and Lakey, of Kalamazoo, were elected a committee to draft a bill on the lines above proposed. Adjournment was had at an hour just this side of midnight.

One is persuaded after a careful review of this Michigan work to think that the questions of game and fish laws are in very able and practical hands in that State. The freedom from freak measures and from the old-time sweeping and senseless "We do resolve" is very marked and very gratifying. Certainly this splendid sporting State is doing all that can be asked of her, and may very well be looked up to in the further councils on game legislation. She has a fine body of earnest men working in these matters, and they are men who know all the ropes of actual legislative work, as well as all the latest theories and facts in progressive protection. It was a very great privilege to be with them, and to witness their careful methods. A last fact worth comment in this necessarily crude summary is the fact that Michigan does not support a "State sportsmen's association" with a trap shoot attachment. It has two general bodies of this State scope, one the Trap-Shooters' League and one the Protective League. This is as it should be. They are getting laws in Michigan. We get trap shoots in Illinois.

From the Land of the Chrysanthemum.

CHICAGO, Ill., Jan. 14.—Mr. J. O. Averill, of Yokohama, Japan, was among the callers at the *FOREST AND STREAM* office this week. Mr. Averill was formerly a resident of New York, but for more than a dozen years has been engaged in the tea business in Japan, where he has large houses at Yokohama and Kobi, occasionally making visits to the United States on business or pleasure. Mr. Averill tells me that with many gentlemen of his acquaintance at Yokohama the *FOREST AND STREAM* is the sportsmen's authority, quite as it is in this country. Within the last few weeks I have had correspondence from British Honduras, from Quebec and Ontario, Can., from Manitoba, Alberta, British Columbia and Alaska. None of this, however, is in any way so interesting as the talk this week with Mr. Averill, who is exceptionally good proof of the fact that a sportsman is a sportsman wherever you put him down. He tells me that there is, indeed, a considerable amount of sport in the land of the chrysanthemum, though rather a mixed state of affairs obtains there. All "foreigners," such as himself, are limited in their shooting to a district of twenty-five miles from certain treaty ports. This concentrates the shooting so much that the game is pretty well killed down in those districts, and Mr. Averill does not think there is much future for sport with the gun for that reason. The Japanese have game laws, but they are rather one-sided affairs. Their open season covers the breeding time of certain sorts of game, and netting and other destructive forms of taking fish and game are allowed. The theory of the Government seems to be to hold up the foreigners for a \$10 license, but not to interfere with the poor native, who could not raise \$10 in a hundred years, and who makes some sort of living by netting, etc. The non-residents of the better class, such as the British and American sportsmen, do not take advantage of the liberality or the short-sightedness of the game law. They make a law of sport for themselves, and put up their guns before the beginning of the breeding season. Any man would be ostracized at the clubs who would continue to shoot after the expiration time set by this tacit agreement.

From Mr. Averill's story I imagine the snipe and the pheasants, with some ducks, to be among the more prominent game birds sought by sportsmen in Japan. The copper pheasants offer good fun in a rough, tangled and mountainous country. There are also woodcock, not the woodcock of America, but the giant woodcock of England, soft-winged and big like an owl. The paddy fields or wet rice grounds are the spots most frequented by the jacksnipe, and sometimes these birds give good sport even yet. I remember that once I mentioned in *FOREST AND STREAM* having seen at the Chicago Academy of Sciences a jacksnipe from South America, a bird apparently marked exactly like our English snipe, but nearly twice as large, a very giant of a jacksnipe. I do not recall the scientific name of this bird at present. I happened to mention this fellow to Mr. Averill, and he told me that they have this same bird in Japan. Its habits are much like those of the jacksnipe, though it is more lumberly and slower of wing. Sometimes the shooter kills one of these birds under the impression that it is a jacksnipe

very much closer to him than the bird is in ordinary flight, and only realizes the size of the giant when he comes to step the distance to him.

Of late years, Mr. Averill and his friends in Japan have taken to fishing. They do not tell just everyone about this, and are a bit vague and indefinite when asked where it is that they find their sport. I suppose that not everybody knows there is trout fishing in Japan. I never knew it before, nor ever heard it mentioned. Yet there is trout fishing, and the trout fishing is of a most interesting sort, and the Japanese are skillful fly fishermen, with a style of their own. I know all about this now, but I am not going to tell about it, but shall promise the readers of *FOREST AND STREAM* before long a treat in the form of an article on this subject by Mr. Averill himself. He will tell a lot of things in the way of angling news from this far-off western country which I think have never found their way into print in any sporting journal. We do not know all about fly fishing in America. There is temptation to break into print over this myself, but I shall not forestall Mr. Averill, who promises this very interesting story at an early date.

I asked Mr. Averill what people thought of the United States now over his way, and he said that since the late war every American has grown a couple of inches, and that in the opinion of all the other powers America has grown several feet. He says that Japan used to think, after the Chinese war, that she could whip the whole earth, but certain little transactions in the year of 1898 have led the intelligent Japanese to believe that America is something of a scrapper herself.

I must not pass Mr. Averill's visit without pointing out one very pleasant lesson which it leaves. He says that the Japanese do not live altogether for work or for money. When a man gets to be about forty-five years of age, he retires from business and his son takes care of him. After that the old gentleman has a house of his own, and doesn't do anything but drink tea and swap lies with the neighbors. (I think I would like to go to Japan.) Another pleasant custom is one which the Japanese have in regard to public vacation trips. The inhabitants of, say, a certain village, contribute each year a little toward a public fund which is to be expended in giving some poor persons a vacation. Lots are drawn and perhaps ten persons, the lucky ones, are given the means to take vacation pilgrimages, which last during the summer. The amount paid to each one is only about \$10, but this will last about all summer, for things are cheap in that land. These vacation pilgrim people may be seen in many parts of the island, attending the shrines, climbing mountains, visiting the places of public interest. They carry a scrip a staff and a mat, and they sleep where night finds them if they do not happen to have the price of a room. Thus they wander and enjoy themselves, and learn about their country, until their \$10 is gone. Then they go back home and go to work, and put their money in the fund for some other fellows to have their vacation after awhile. This, it seems to me, is a beautiful custom. It is slightly different from the American method. Here we take our vacations after we are too old to digest a beefsteak or to walk a mile. It shall happen one of these centuries that the Americans will awaken to find that they did not know everything in the world, especially about vacations. It will give me great pleasure then to turn over in my grave, wherever that may be, and say, "I told you so! You ought to have read *FOREST AND STREAM*."

Singing Mouse No. 7.

It was but a little while ago that I made mention of another singing mouse that had been discovered. This week I have still another one to chronicle, which I believe is either No. 7 or No. 8 in the series recorded in the *FOREST AND STREAM*. One evening this week my friend, Mr. C. W. Lee, handed me a clipping from the New York Herald of Sunday, Jan. 8, describing a captive singing mouse. This was very interesting, and I kept the clipping. On the following morning I received the same clipping from Mr. Henry J. Howlett, of New York City. Later in the same day my friend Mr. Bridgman, of the Crane Company, New York City, sent me the clipping, and still later my friend Mr. J. B. Burnham, apparently foreknowing, also mailed it to me with the following remark: "Here is something about a captive singing mouse. No doubt half a dozen people have sent you this, but on a chance they all expected the other fellow to do so, I will run the risk of being *de trop*. I don't imagine you care for the mouse, or I would send that."

I would like to thank all these gentlemen for their interest, and perhaps it might be interesting to print something of the Herald's story about this mouse, which purports to have been caught in a trap by Augustus G. De Tartas, of 709 Columbus avenue, New York City. The latter writes:

"I was very fortunate the other day to catch a singing mouse, and, having since ascertained that it is a great rarity, I would very much like to hear from some of your numerous readers why it is so rare, and to what species of vermin it belongs.

"The one I caught is an ordinary-looking mouse to me, and the only difference I see is that it sings like a bird. It eats anything I feed to it, sleeps most of the day and sings all night. It was very small when I caught it, but has grown considerably since then, and at present is the normal size of an ordinary mouse."

This mouse is described as singing so loud as to "wake the baby." This I should think unlikely, unless the baby's slumbers were set upon a hair trigger.

Personal.

Mr. A. Lent, President of the Austin Cartridge Company, of Cleveland, O., will be in this city for a brief visit on Monday next. Thus I am informed by Mr. C. M. Wills, Superintendent of the same company, who called at this office yesterday on his way to Galesburg. Mr. Wills carries also the very sad news that Mr. Coleman, President of the Austin Powder Company, has been very seriously sick for nearly three months, and is still unable to be at his desk. Mr. Coleman is one of those able and pleasant gentlemen who can ill be spared, even temporarily, from the business world, and I hope his recovery will be speedy.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Exhibition of Catlin Pictures.

WHEN we consider the primitive American hunter and his ways of life in the old days, before contact with the whites had greatly changed him, we always think of George Catlin. His name is as closely linked with the Indians as Audubon's is with the birds of this country. Catlin was the first man who in any large way attempted to write of, and to picture on canvas, the North American Indian, and his habits and customs, and in carrying on this work he traveled over many thousands of miles of land and sea, for he was not satisfied with showing the Indian to the white inhabitants of this continent, but introduced them as well to the public of many of the capitals of Europe.

Catlin's enthusiasm for his work was unbounded. For years he journeyed over the land, north, south, east and west, visiting different tribes of Indians, living with them and studying their life. He pictured their sports and their religious ceremonies, and showed how they obtained their food and how they lived from day to day in their camps and permanent villages. The work that he did in portraying the customs of these primitive peoples was long undervalued in America, but it is coming to be appreciated now, and within the past few years the Government at Washington purchased a great number of his pictures, and prepared a large volume on his work.

Catlin was an indefatigable worker, and besides the well-known Catlin gallery, left behind him a vast amount of scattered material, pictures and manuscript, which is gradually coming to light. A few years ago a considerable amount of this was secured by Mr. Archibald Rogers, of Hyde Park, N. Y., in whose hands it is happily safe. There is now in this city a collection of thirty-three oil paintings to be exhibited next week at Norman's, 234 Fifth avenue, which should be seen by every one who is interested either in Indians or in Western big game, or in the transformation that has taken place in our Western country within the last sixty years. Many of these pictures are identical in subject and treatment with those in the Catlin portfolio, which is sufficiently familiar. They deal in large measure with life in the West, and hence to a great extent with buffalo and buffalo hunting in different ways. There is the chase by Indians mounted on swift ponies and armed with bow and arrows, or with the lance; the ordinary stalk from behind cover; the approach under the disguise of wolves; the killing in deep snow by hunters on snowshoes. But besides the taking of the extinct buffalo, the capture of other game is pictured. There are representations of moose hunting by an Indian on snowshoes, of deer killing by night and by day, and of salmon spearing by torchlight. Two pictures show the chase and capture of the wild horse, one a fight between buffalo and bear, and another a combat between three mounted Indians and two grizzlies. Other aspects of Indian life are mirrored in the picture of a small camp of people who have just discovered a prairie fire approaching them, in scenes where three Indians appear to be in the path of a stampeding herd of buffalo, and where Indians in camp are alarmed and have just seized their weapons as if to resist an approaching.

While most of the pictures belong to our own West, there are five which present South American scenes. One of these, a leopard hunt, shows the artist about to fire at two of the animals, one of which is already wounded. There are two pictures representing flamingoes, one of which shows their nesting ground; there is an ostrich hunt on the Pampas of the Rio de la Plata, and a semi-tropical forest scene with Indians bathing.

The paintings to be exhibited were shown in London in 1859 in connection with a collection of Indian costumes and weapons, which was purchased from Mr. Catlin by the King of the Belgians. The exhibition will begin Jan. 31, and will continue for one week.

The Fleeting Fox.

Editor Forest and Stream:

Judging from a letter, my young friend at Philadelphia, N. Y., has been hunting muskrats, minks and foxes pretty steadily since the arrival of snow, and the net result so far has been a red squirrel, a rabbit (great Northern hare), one muskrat and a bag full of experiences. A rabbit, a muskrat and a "puny red squirrel" are rather too small game to tell about, according to the rather pot-hunting instincts of boys who figure usually by the size and number of kills made. But I will say this for boys who hunt, they commonly give more space to telling how they missed than how they came to kill. For instance, all I know about the hare is embodied in this sentence:

"Cousin Min cooked the raggit I got down the river yesterday, and, it was good."

It took more to tell about a fox which is "still skeddaddling."

"I went hunting across the trestle last Saturday. Snow was kind-a deep, and the day just like the woods. Had my shotgun. That makes me think, I guess I'll get a camera first chance I get, because it would be fun to take pictures of things. I climbed the wire fence and went down the top of the ridge and into them woods, you know where the little open is like a choppin' up home, and all of a sudden I seen something above a log 'bout ten rods away. It was kind-a white and kind-a red. It bobbed up and then out of sight. First it was at one end of the log and then it wasn't anywhere for two or three minutes, then up it would come at the other end where the branches was.

"I figured it out that I'd sneak down the bank and back up through the woods to see t'other side of that there log. I done it, and by Jee it wa'n't there at all, but on t'other side the log. But I seen a track on the log like a place some critter had climbed over, and that thing wavin' looked pretty interesting. I thought it too hard work to go sneaking way round again, so I went sneaking crost the open straight at the log just like any other idjit, as if I hadn't still-hunted partridges and buck rabbits long as I can remember. But I bellied along through the snow, and pretty soon I was about three rod from the log, and I looked. Nothing there. Got a little higher, then higher. Nothing. So I stood up and shook the snow out of my hair and blew on my fingers.

"Gosh! There sot a fox with his mouth wide

open and a mouse's tail hanging out the corner of his lips. He wiggled his lips a little and looked 'bout as silly as I felt when I ploughed the ground up with shot two rods to one side of his fleeting carcass. He'd been eating mice from under that log—guess he got five or six. I don't see why a fellow can't just aim at a beast and hit it like it was a can or fence board or anything. But who'd 'a' s'posed a fox would be dancing round a log at 9 o'clock in the morning like it was just daylight. I seen an owl too, but I didn't get him—didn't even shoot. Just as well, considering the fox, I reckon. I'll bet that fox is still skeddaddling. He went sideways, and made one track like a rabbit's—reg'lar Y. I had 4s in, and just think what they'd done to that beast at four rods."

So far as I am concerned, I am rather pleased at the outcome. Think of that fox with wiggling lips and dangling mouse's tail struck silly with surprise done to death the next instant. We would have missed the "fleeting carcass" then.

RAYMOND S. SPEARS.

NEW YORK.

The New York Deer Law.

Editor Forest and Stream:

Senator Cahoon has introduced a bill to amend the law relative to the killing of deer in this State, and a like bill has been introduced in the lower house of the Legislature. This bill provides for the shortening of the open season on deer to one month, viz., from Sept. 15 to Oct. 15, and permits hounding throughout the entire period of the open season. This bill, in my opinion, would not stand a ghost of passing were it not for the fact that its sponsor—Senator Cahoon—is the chairman of the Senate Committee on Game Laws, and while confident that our present Governor would not permit it to become a law I still believe it to be the duty of every true sportsman to endeavor to prevent, if possible, the passage of a measure so fraught with danger to deer preservation. There has been but a single year of trial of the non-hounding law, and it is doubtless true that the average hunter has not found it quite so easy to procure his venison as under the old hounding law, but give the present law a decent trial, and we shall find the same conditions as now exist in the State of Maine, where the veriest tyro can kill his deer without difficulty without the aid of the hound. A few years ago, under the old system that permitted hounding, deer had become a scarce commodity in the State of Maine, and it took several years of hard work on the part of friends of game protection—none worked more diligently than *FOREST AND STREAM*—to educate the people of that State up to a point where they could see the great benefits of a non-hounding law. To-day deer are plentiful and easy to get in Maine, and the people there are almost a unit in opposition to any change looking toward the old order of things.

The same will be the case in this State if we will only wait long enough to give the present law a fair test.

In the interests of deer preservation and of sportsmanlike methods in deer killing, in the name of humanity and common decency, it behooves every true sportsman to make every possible effort to prevent the repeal of the present law. Everybody perhaps recognizes that the shortening of the season may be a move in the right direction, but if a return to the inhuman practice of deer dogging is to be the price of securing such an amendment, better a thousand times leave matters as they are.

M. SCHENCK.

TROV, N. Y., Jan. 18.

A Virginia Shooting Country.

LUMBERTON, Sussex County, Va.—*Editor Forest and Stream:* There is no doubt in the minds of the sportsmen who have visited this district during the bird shooting season, which is fast waning, that the country round about possesses advantages fully equal to any in the South. North Carolina is for a variety of reasons the favorite resort of quail hunters, and in consequence this district has not suffered. On the contrary, it has gained. The close season which reigned here during 1896-7 has given the birds an exceptional opportunity to increase, and doubtless many have come across the Carolina line, not far distant. This year few sportsmen knew of the country, and not many came, but those who did went away heavily laden, happy and determined to come again and bring friends.

The country is an admirable one to hunt, low, level, extensive and not too thickly settled. The lands are not generally posted, and then only as a protection against the inroads of the "pot-hunter." Visiting sportsmen are extended every courtesy, and royally welcomed. The sportsman who stops off at any one of the many stations lying between Capron and Semora is sure to find quail in abundance, guides at reasonable prices, fairly good dogs and comfortable quarters. Several points offer fine turkey shooting, and everywhere hares and squirrels are to be found in abundance. The woodcock is not unknown. Deer are hunted in season, and fox hunting furnishes exhilarating sport for all lovers almost, one might say, the year round.

The country is beautiful with its stately pine, oak and hemlock here and there, the air invigorating and the climate very charming to one who comes from the snow-bound North. The quail season ends Jan. 15, save in several counties, of which Sussex is one, where the time extends to Feb. 15. Turkeys may be killed until Feb. 1, and hares and squirrels until March or later.

A few sportsmen are enjoying the late shooting, incidentally joining in the fox chase from time to time. There are still many quail left for next season to furnish pleasure and exhilaration for the hunter.

HERBERT L. JILLSON.

A Houghton, Mich., dispatch says: "Jerry Murphy, a well-known miner, living in Calumet, sold his big St. Bernard Barney to a Klondike party eighteen months ago. The dog was taken to Dawson City and performed good service. Last night Barney reappeared at Murphy's home in Calumet. How he succeeded in returning from Alaska is a mystery."

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

Fishing with a Tenderfoot.

IN the summer of 1896, a party to which I belonged made a very disastrous trip into the trout country, which I consider one of my richest experiences in camp life. The peril and privation experienced in that camp was of the kind to try a man's soul, and while we could have come home in a day, we were always hoping for the weather to clear, and we clung to the hope that we would have a day or so of good weather further on to make up for some of our discomforts. It has become a custom with us to go to the woods for a few days on the Fourth of July. Conforming to this, we resolved to go, but the circumstances were such that business kept us engaged up to the moment of starting, and all of the commissary work, such as the buying supplies and getting them together, devolved on black Joe, the cook. We felt tolerably easy about it, for we knew that with plenty of trout to eat we would fare very well for a few days, with but few accessories. Since that we have not taken any such chances on Joe.

It was a rainy season, and we resolved to have plenty of fishing worms for bait, in case the waters were too flush for fly-fishing, and we impressed the importance on Joe, but he made a failure at getting bait, owing to the laborious nature of the work. That handicapped us, for that was before I learned to look for fish worms under moss in the spruce woods.

Before we started the party received an addition in an Englishman, whom we knew as Tommy. He was a first-rate fellow, who had been running with us a good deal, but who had not been invited, not knowing what kind of a camp mate he would make. But, he not knowing the ethics of camping parties such as ours, very genially announced his intention of going along, which was very well received, for we all liked him. Otherwise his assurance would have not availed him. We know how to give what is vulgarly termed the frozen face.

Tommy was a man acquainted with grief. It had come to him when he had invested a large sum in fancy farming in Canada, and again when he tried tea planting in Ceylon. His experience in West Virginia as a druggist was equally unfortunate, for, becoming tired of life here, he presented his pharmacist the drug store as a token of esteem, and in place of salary due, and went to London for a while. Later, letters came from British Columbia that he was on his way to the Klondike, and then a long silence. A short time ago the word came that he was dead. He belonged to the "legion that never was listed" that Kipling writes of. Our experience with him leads us to believe that he could bear misfortunes, but could not avoid them. May he rest in peace. He is one of the men I have been with when I fished.

We wanted to make the Forks of Cranberry the first day, and we made a desperate effort to start early; therefore we got away by 10 o'clock. We were on horseback, each having packed all we could on our saddles and then climbing on top. The most of us were mounted on the slim, active horses of this mountain country. Joe's mare, who is twenty if she is a day, who is known all over the world as Kitty's Colt, was packed until you could just see her legs moving. Tommy was unfortunate in his horse. His pharmacist had a low, heavy built Percheron, as fat as butter, and as awkward as an ox—the kind of a heavy, unwieldy animal that the Sunday school books know as Dobbin. Tommy borrowed this horse from the Dock. The Dock, hearing us say we would start at daylight, came poking in on him about 10, expecting to find us gone, and was rightly punished for his duplicity. Tommy immediately countermanded his order of a horse from the livery, and rode away on the Pride of the Farm.

Our way lay through an unbroken wilderness. Single file, the horses stepped along a marked trail, picking their path among huge boulders, over the roots of trees, forcing their way through dense undergrowth to avoid fallen trees. This kind of going is kept up for four hours. The riders, perched upon their packs, are at the mercy of their horses. Old Dobbin blundered his way with the balance, being strong and willing, but he shed his shoes, and Tommy's baggage, which was done up in huge shawl-strap arrangements, such as you have seen heavy, swell Englishmen carrying, and which was strapped on behind his saddle, wore holes in poor Dobbin's hide, and made him switch his tail and flinch, indicating that he was very uncomfortable. No reticule equals a three-bushel bag for going into the woods horseback. We at last arrived at the South Fork, and traveling down its rocky bed for a while, arrived at our camp about dark. The horses were given a half-gallon of corn, and having eaten, immediately struck out for civilization in a way they well understood. Ten miles would bring them to a pasture on a mountain so high that flies do not abound, and there they reveled in blue grass fetlock deep, only as stable-kept horses can—except poor Dobbin. He stayed in the woods in the laurel bushes for a week, haunting our imaginations with his misery.

Ours was an ordinary hunter's camp, and when we came to it we found that very little of the bark roof remained. The Tugs had been there and had occupied the camp, and in a spirit of waste had used the roof for their fires. One side of the camp was whole. We set about making a fire for supper, and Tommy, so glad to get there off the terrible trail, was so happy and cheerful and gay, it was a joy to see him. He set to work to gather the little twigs and bark lying around. Right in front of the camp lay a large, rotten spruce, with its numerous branches sticking out in every direction. He fell among them, and after a severe tussle fell heavily to the ground and strained the muscles of his legs. Then for days he could only hobble around the camp-fire.

In a party of men some look at the clouds and others do not. In this case the weather prophets also looked at the shelter. The result was that two of us laid down early and went sound to sleep, regardless. By so doing those two secured the right to the dry corner for the outing by pre-emption. The others spread pieces of oilcloth over the rafters and got as good places as possible. Tommy

was the last to lie down, and he had the extreme end in the open part of the camp. That night a cold rain fell. I had a comparatively dry place, but I woke some time in the night dreaming that a hole was being drilled in my head. I was lying under a drip, and a little stream of water was falling on my temple. I moved a few inches. The fire of the camp gave a faint light. I was very drowsy, and I remember watching the breath of oilcloth under which Tommy was lying. It was belying with the water it was holding in its folds. I grew interested in it in a sleepy sort of way. The water accumulated quickly, and the weight presently moved the cloth and poured several gallons water in the face of the man sleeping the deep sleep of exhaustion underneath. There was an upheaval of blankets and things, and Tommy came forth with fire in his eye for the trick that had been played him. All the camp feigned sleep. Tommy tried to arrange his shelter again, but was unable to make a watertight arrangement of it. He kept fussing about the "cesspool," in which he tried to sleep, and finally came and stood at our feet, trying to sleep standing up.

The fishing was tolerably good next day, and that evening there were 142 trout in the little pool. We fed without stint that evening at supper, and at breakfast the next morning. These were the last full meals we had for days. A cold rain set in that night, and when we woke next morning we found Tommy looking pale and haggard. He had slept in the "cesspool." The little river was roaring and the boulders were rolling in the current. One fork was muddy, but the other, in spite of the flood, was perfectly clear. There was to be no fishing that day. The next day I went out, and after hours of fishing had nine trout. Hunger was making itself felt. We had plenty of bread and maple syrup and butter, but the bacon the unhappy Joe had selected was the fattest, saltiest pork ever packed in the unscrupulous West. The gorge rose at this food in a day or two. Being confined to such diet for a few days makes one understand why our poor soldiers were not able to eat enough to keep well in camp. We had some "poison," but it had to be divided among the survivors in an equitable manner, and when Tommy begged for a "soupcon" it had to be denied him. "Soupcon" became the byword of that camp.

All the time fishing was out of the question. As soon as the stream would run down, a fresh rain would put it up again. There was game in the woods, but we were unlucky. There were two guns, a .32cal. rifle and a double-barreled shotgun. We could not find the game when we went to hunt for it, not even a ground hog. One day when I was roaming around looking for exercise, without a gun, I saw two doves, as I thought, of a kind that I had never seen before. It was my first sight of the wild pigeon. I have seen them since then in the mountains, and it is the belief that a limited number of these birds rest in our mountains.

One day Mr. M. went down the river on a hopeless fish. About a half-mile below camp he sat down on a ledge of rocks where a cool spring filters down and fills a hollow in the rock. As he sat there, thinking, no doubt, how well some of the poison would go with that water with a man who had been soaked in a leaky camp and had been wading deep fords in the river, he saw a deer in the water below him. It came up the stream until it was in a stone's throw of the place he sat. Presently a fine black and tan hound came to the river, and he tied it with a piece of string and brought it into camp. Necessity knows no law, and the next day the two guns were put in the hands of the best shots, and the hound was sent to the woods. Hardly a quarter of an hour had passed until a deer was jumped, and it led the hound on a far cry to some unknown region, and we have never seen the hound since.

That afternoon, when we held our pow-wow under the dry corner of our wretched habitation, one of the circle said: "We've always blamed the Tugs for killing people's sheep in the woods; suppose a sheep came along this camp to-day, what would we do to it?"

"Not a thing!" said one feelingly.

"I'd tell that sheep to get away if it could," said another.

"We would do like that old Tug preacher that struck the judge's camp on Cherry," said another. "One fall when a lot of them were camped up there an old Tug came into camp and asked if he might stay. The next day was Sunday, and some of them took their guns for a scout through the woods. The Tug said he was a preacher, and that he did not hunt on the Sabbath, and commenced to read the Bible. He was left to keep camp, and when the men got back he had a fine deer hanging up. He said: 'I seed that buck go hopping by over yander, and it popped into my head that "Where the word of the Lord was not preached, there was no Sabbath," and I let him have it.'"

"I guess we would compromise with our conscience and may be we would pay for the sheep afterward. What do you say, Tommy?"

"I would like to have a soupcon," replied the Englishman, who was bearing his trials with true British pluck, but was taking interest in but one thing.

We got enough of that camp. Sleeping in water under wet blankets; eating soggy biscuits and maple syrup; lamenting our fate that we were spending valuable time and not getting any fish; teasing Tommy and reviling the old frying pan that served up the rancid bacon. Finally Joe was sent for the horses, and that day he was gone our misery culminated. Every man for himself was the rule, and with visions of good things to eat we set about to find our dinner. Two went hunting. M. came in soon with a little red squirrel, fairy-diddles they are called here. He deliberately sat down and cooked and ate it before our eyes. I was ravenous. Having failed in hunting, I was fortunate enough to see a flock of cherry birds—they are about as big as robins—and I killed two. I hung them on a string and cooked them, and with them as a relish I ate lots of bread, and never had a better meal in my life. I remarked politely to the unfed: "I am sorry you are not hungry. I would so like you to try some of the pheasant." S. and B. caught two fish apiece, and they prepared and ate them in the same starving, selfish and solitary manner. Tommy alone was left. His ^{ear} had recovered; and he had failed both in hunting and fishing. He concluded to tackle the bacon. Cutting off some slices, he held them over a roaring fire. The meat

took fire and burned up. He tried it again, and the same thing happened. He dashed some water in the frying pan and ate the charred remnants unwisely and became very sick.

That evening I tried fishing, and found a place where the fish were biting, and caught sixteen fine trout before my bait gave out. That gave us a good supper.

The horses were there, all in good condition, except old Dobbin. He came in looking like the ghost of his former self. Three shoes were gone, and he could only hobble painfully along. His back was in frightful condition. There was but one thing for Tommy to do, and that was to walk out. The rain was pouring down when we started. In the procession I was riding next to Dobbin. In a bog we were wading through, I distinctly saw him reach out a front leg like a racer, and planting his foot on Tommy's hip, bear him down into the mud, where he lay helpless for a moment or two. I will always believe that the horse did it on purpose. Anyway, Tommy rode him home. That cold rain fell steadily all day. My horse strained a tendon when I was eight miles from home. The gang rode on and left me, each too miserable to care what became of any one else. I was within a half-mile of a house then, and the farmer gave me a good dinner and promised to take care of my horse, which I prized highly. I walked home. We will draw a veil over the scene when Tommy returned Dobbin, the pride of the farm.

When we all met again, we found that we were still friends, though in the hardships hard words had passed. It is not hard to be a neighbor unto a man when you are warm, dry and well fed. Getting lost in the woods and being hungry, wet and cold tries men's souls.

Our poor friend, generous to a fault, and a fine specimen of the typical John Bull, and who thought nothing of going to the uttermost ends of the earth, always on the out trail, "breaking the way for the rest," has gone to his reward. May he find the long trail free from the discomforts he experienced in this life!

ANDREW PRICE.

MARLINTON, W. Va.

Fish Pirates and Fire-Bugs.

SYRACUSE, N. Y., Jan. 19.—*Editor Forest and Stream*: Inclosed is a report from Sodus Point, printed in the Herald of this morning:

"Sodus, Jan. 18.—The law-abiding people of Sodus Point are being stirred up on account of the depredations of fish pirates, who seek to revenge themselves upon people who have lent aid to the officers of the law.

"One day last week Game Protector George Carver, of Lyons, went to Sodus Bay to seize any nets which might be there. As was his custom, he stopped over night with William Bennett, a boat builder, who has several boats to let. He had not been on the scene of operations long before he captured a large net belonging to local fishermen. He burned the net according to law and left for Lyons.

"About 2 o'clock Sunday morning it was discovered that Mr. Bennett's cottage, which he built last season, was in flames. All efforts to extinguish them were in vain, and the building was burned to the ground in a short time. The loss was a heavy one to Mr. Bennett, as the building was valued at at least \$1,000, with but \$600 insurance. The contents of the building were all lost, including twenty-seven rowboats, three sailboats, two naphtha launches, and a \$60 net.

"Mr. Carver is in the habit of leaving his horse at Mr. Bennett's when making his raids on the illegal fishermen, and their hatred of Bennett has arisen from the fact that he was assisting the game protector to discover the whereabouts of the nets. About a year ago letters were sent to Mr. Bennett by unknown persons, threatening him with violence if he harbored Carver again. On account of the publicity Mr. Carver makes it a point never to stop at a hotel, and as Mr. Bennett ran a sort of livery stable in connection with his boat house, he naturally made that his headquarters.

"Mr. Bennett paid no attention to the threatening communications, and before long two of his boats were stolen and destroyed. A reward was offered for the return of the boats or for information which would lead to the discovery of any one connected with the affair, but not a trace could be found of either boat or the thieves.

"Shortly after this Mr. Carver came to the bay and another man kept his horse while he made his sally. This man was also threatened. Mr. Carver's tools were all destroyed, the tail was cut off his horse, his harness was cut into strips and his wagon smashed into pieces. He was threatened with death, but being a brave man made none the less effort to stop the illegal fishing.

"Last week the illegal fishermen showed consummate nerve by re-capturing a net which the game protector had seized. Mr. Carver went on the ice near Resort, at the head of the bay, and found a valuable net in the water under the ice. He chopped a hole in the ice, secured the net, took it to shore with him for the purpose of burning it.

"He left the net lying on the shore while he went for some kindling wood, with which to start a fire to burn the net, and while he was thus occupied the fisherman who owned the net came skating up the bay and took it away with him. On Mr. Carver's return the net was missing. Having no skates, he could not make chase."

This shows what kind of men the game protector has to deal with; and still we allow licensed nets, and have the State stock the waters for their benefit. The Commissioners should offer a large enough reward for the conviction of these incendiaries, so that we may get them. There is too much of this work done by the fish pirates.

Sea Trout.

"Who hath seen the beaver busied? Who hath watched the black-tail mating?

Who hath lain alone to hear the wild goose cry?

Who hath worked the chosen water where the ouananiche is waiting?

Or the sea trout's jumping crazy for the fly?"

—Rudyard Kipling.

OF all the trails laid for the travels of the wayward "feet of the young men" some years ago, mine led me through the camps of "proved desire and known delight," to the head of an inland estuary, where a lazy stream after weeks of pleasant dawdling through wild and romantic scenery at last finds rest in a calm salt-water basin, far inland from the Atlantic's turbulent waters, and in a spot exactly similar to that of which Kipling must have been dreaming when he sang of "the sea trout jumping crazy for the fly."

We were a goodly and pleasant company, comprising the Judge and members of the Bar, who had been holding the Supreme Court on Circuit in the many scattered towns built in the deep bays and firds in southern and western Newfoundland. We had held court in several harbors and dispensed justice to the straggling populations, who, from the nature of their avocations, could neither afford the time nor the money to seek justice in the capital; and for days we had drowsed during the heat, in the small stuffy court houses, listening to and adjusting the various cases of fishery disputes and trespasses—the offending against the laws being confined to such minor offenses among these peace loving people.

But "it fell upon a day" that we were clear of all court work and were in the neighborhood of "the chosen waters" for salmon, grilse and sea trout, and as we had some hours to spare, it took very little persuasion to decide his Lordship, the presiding Judge of the Circuit, who was a keen angler himself, to give the members of the Bar a few hours fishing. Accordingly we started for Miller's Passage in Old Man's Bay, and had a pleasant run. Our clipper steam yacht Thecla was well adapted for a pleasure cruise of this kind. The boys all idled around smoking and chatting, or listening and laughing to the pleasant anecdotes of two of the best *raconteurs*, whose equals it would be hard to find—one a witty and cultured Irishman, "a descendant of Irish kings," and the other a leading Queen's counsel, who had traveled some, and had laid up and digested choice *morceaux* where'er he had sojourned, and now brought them forth from the crucible enriched with touches of genuine humor, and regaled the lounging listeners, who repaid his efforts with loud and spontaneous bursts of laughter. Even the crew on deck involuntarily drew near and added their quota to swell the merry chorus.

The water was as calm as oil; the scenery was grand and changing; and to crown all, a gentle sou'west wind was sighing, but not with sufficient labor to ripple the clumbering water of the bay. Before we had time to realize that we were near our journey's end, the yacht's siren awoke the echoes of the hills, putting to wing here a flock of black duck that took a direct flight far from the invaders, and there a company of white winged sea gulls, who sailed round and round in magnificent circles, uttering sharp querulous notes, as if interrogating the intruders. In a very few minutes after the anchor had been dropped, all the anglers of the party had their "rods and reels and traces" all ready to enjoy the sport that many had enjoyed in anticipation in their dreams for many a day before. The cutter was launched and manned, and all hands bundled in without the usual regard of precedence or seniority, and in a few moments we landed at the mouth of the river flowing into Old Man's Bay. There was not room enough here for the whole party, so most of us started for a small lake on the river about a half a mile away. After a short tramp through the shrubbery, the long looked for lakelet burst pleasantly on our view, nestling cosily at the base of a high hill, which was clothed to the very summit with its gorgeous garb of evergreens, flecked here and there with the flickering foliage of larch, birch, aspen and other deciduous trees arrayed in all their midsummer finery. Then "there was hurrying in hot haste" to joint the rods and bend the favorite flies. There were seven rods in the party; the "non-combatants" carried the baskets and landing nets, and stood by and cracked jokes at the anglers as they waded out in the shallow waters. The writer and a chum knew a trick worth two of trying around the margin, and made a bee-line for the "likely spot" at the head of the lakelet, where the river mingles with its waters, and rests itself gently, before resuming—as it does a few hundred yards further on, with increased briskness—its last lap on its journey to the sea. With what eager haste I joined my rod, and bent my flies—a cast that had been prepared for many days before. How cautiously I waded out over the intervening shallows—how gently dropped the seductive flies just where the flowing ceases and the water darkens and deepens. And then! Ah, then for the sight and sound that a true angler would encompass a half a hemisphere to experience—the mad rush of eager "sea trout jumping crazy for the fly"—the electric thrill of the successful "strike," the music of the running reel, as with a rush and a whirr the sportive beauties made the glittering baits their own. And then came the struggle between science and guile on the one part and strength and innocence on the other, with the usual result, in this world at least, the triumph of the wicked—except, of course, as always happens with the largest fish of the lot, whose main strength and stupidity saved him for a while, as after an ingenious wrench, that cleared him from the hook, he "waggled" away with speed, his tail and fins showing unmistakable tokens of the utter contempt in which he held his seducer. I had hooked four, and after a few minutes landed three of them. They were gamy little fellows, but didn't weigh more than ¼ lb. each. I threw several times and each time got a fish on every fly—but not the fish I was after.

In the meantime my companion had gone a little further on and crossed the stream, just where it eddied in under the base of the hill, and where the large white water lilies lay in leafy luxuriance. On hearing a satisfied grunt from him, I raised my head, and a glance at his taut line and pliant rod making a complete segment of a circle told me more plainly than any words that he had hold of one or

more of the brand we were after. A short struggle, and two beauties weighing about 2 lbs. each lay, like pictures, in the grass at his feet. With his permission I cast into his preserve, and in less than a moment felt that my fondest dreams of fish were realized, and that I had hold of two or more "speckle tails that were well worth the admission fee." Then began the most interesting tussle I think I had ever enjoyed. They started for the middle of the lakelet with the vigor of unbroken colts. I had perforce to give them their wilful way—my only consolation the music of the running reel. Presently they "let up" a bit and my turn came to take a hand in the sport. How tenderly I checked them! With what firm though sensitive fingers I wound them in! How bravely they tightened the silken cord, and what beautiful curves the rod described, as with waning strength they gallantly disputed every inch. They are coming—coming slowly, unwillingly, but surely. I have their noses over the water now, and they're nearly mine. I am just conjecturing as to their probable weight when "whish," with a last grand effort, off they start again, making a brilliant dash for freedom, taking nearly all the line from the reel in the gallant attempt. But alas, 'twas only an effort—an unsuccessful effort—and in a few moments more, with the aid of a landing net, I have landed the captives and feel proud of my conquest. They weigh a little over 2 lbs. each, and make such a pretty picture as they lie at my feet in their mossy bed, that I make up my mind that even if I do not hook another fish, I am well satisfied with my evening's work. The rest of the party had been getting small fish in abundance, but as they all had been spectators of the sport at the mouth of the stream, they all surely, but slowly, gravitated to the spot, shaking the small fry off their hooks as they waded along. There were six or seven rods whipping the one small place, only a few yards in circumference, and of course we expected that the sport would soon be over. But no; notwithstanding the noise and bustle made by over anxious fishermen outraging every canon of the "meditative man's art" the sport held for over an hour; and from scientific angling, I fear, I have to confess that it degenerated into indiscriminate slaughter. I am afraid we acted very much like "trout hogs," but our pleas in defense were, that we had a ship's crew to supply, that not a fish would be wasted, and that perhaps for the following twelve months they would not be again disturbed, except perhaps by poachers who might go there with nets and haul them as articles of commerce. As 'twas coming on dusk, we gathered our fish in baskets and on "gads" and made our way down to the beach where the boat was awaiting us. In a few moments more we were aboard the yacht, handing over our trophies to the steward, who welcomed this toothsome addition to his larder, and filled a large ship's pan with beautiful fish, the largest of which, by actual weight, tipped the scales at 10z. over 4 lbs. We all sat down with appetites sharpened by the bracing air and evening's exercise, and over the dinner table each vied with his neighbor in detailing with great good humor the various events of the evening, and enjoyed the sport over and over again. And when the covers had been removed and the faithful "briar roots" produced, and the votaries of the goddess of Nicotine had burned incense in honor of their deity, the wearied anglers sought their couches, lulled by the soft evening breezes, and soothed to rest by the scarcely perceptible motion of the steamer, and enjoyed the deep restful sleep that comes ever to those "who work the chosen waters"

"Where the sea trout's jumping crazy for the fly."

W. J. CARROLL.

St. John's, Newfoundland.

Connecticut Fishing Interests.

Commissioner A. C. Collins sends us the biennial report of the Connecticut Commissioners of Fisheries and Game, from which we make the following excerpts:

The hatcheries consist of two small buildings on leased ground, one for shad hatching at Shelton, and the other a makeshift at Windsor Locks, for hatching trout and salmon. Both hatcheries are not worth over \$200! The State owns a building at the retaining ponds at Joshua-town, in the town of Lyme, not fitted up for hatching purposes. This is all the State owns in the way of State hatcheries. The second duty is that of the introduction, propagation and distribution of such food fish and game as are adapted to the waters and lands of the State.

There being no appropriation available for the introduction or propagation of game, it is perhaps needless to say that we have been unable to do anything in this direction. In our report of 1895-96 we said: "We suggest the wisdom of authorizing your Commissioners, when it can be done at a reasonable or nominal cost, to lease tracts of land as State game preserves. The main expense to the State would be that of posting said land and prosecuting poachers. There is no county, we are sure, where this could not be done, and unless the State means to take up on quite a large scale the propagation and introduction of game, its extinction is merely a question of time." With an ever increasing army of sportsmen, with no more territory than fifty years ago—that time will arrive much sooner than many expect.

There being no appropriation for the "enforcement of all laws relating to fish and game," we found it a very difficult matter to police the State, without a dollar appropriated for such work. Through the "Special Protectors of Fish and Game," appointed by this Board, we have enforced the laws relating to fish and game as well as possible under existing conditions. All known cases of infraction of the fish or game laws have been prosecuted.

During the last two years we have co-operated with the United States Commission of Fisheries and Fish in the propagation of lobsters, resulting in over 50,000,000 of young lobsters being planted in the waters of this State. The State of Connecticut is the only State in the Union that retains in ponds young shad six or seven months. The young shad are then 3 to 5 in. long before they are liberated. The beneficial results of this method of stocking have abundantly been shown in the large number of adult shad taken this year in the Connecticut and Farmington rivers.

In the last-named river shad fishing had been of no

account for years previous to 1895. In that year we placed nearly 500,000 shad fry in a pond situated in Poquonock, on the Farmington River. In October, 1895, we liberated from the pond the young shad in the Farmington River. When given their liberty the shad were 3 to 5 in. in length. Mark the result. Thousands of the finest adult shad were taken in that river during the past season, as was predicted by your Commission. As one shad fisherman expressed it: "There were more shad this year than we knew what to do with." This year shad have been cheaper in the market than suckers. We find Connecticut people now boasting of the superior quality of their shad, as compared with all others in the market. Unless the artificial propagation of the shad had been carried on in this State, we think there would be no shad worthy of mention in our rivers. In turning out millions of young shad 3 to 5 in. in length, as the State is now doing, the adult fish do not command the fancy prices of a few years ago. The State is concerned as to the abundance, quality and price of the products taken from the waters.

When the conditions are impaired, when there is evidently a decrease in the food-fish supply, then it becomes incumbent upon the State to adopt prompt measures to arrest any decline. The rational method of dealing with the fisheries is to supplement as far as possible by artificial propagation any deficiency in the natural reproduction. We doubt not that the broad-minded, free-handed Connecticut people will adequately support with their good will, and a reasonable appropriation, a thorough, well-considered and efficient plan for future fish propagation.

In providing such a plan, and in carrying it out to a successful termination, no agency can be so adequate as stocking our rivers, lakes and streams as fingerling fish. The late Col. Marshall McDonald, when United States Fish Commissioner, said: "My judgment is that 1,000 yearling fish is the equivalent of 100,000 fry." Fingerling trout and shad planted in the fall are stronger, and a more active fish. They find an abundance of food hatched out for them. They have a better start in every way to fight their way, as they must certainly fight in the wild waters. In fact, the planting of shad or trout during the fry stage of life is a waste of money, effort and time. The late Thomas Andrews, of Guilford, England, one of the most successful fish breeders in Europe, said: "My experience has taught me that one yearling fish is worth a thousand fry for stocking purposes."

Advanced fishcultivists in Europe are united in acknowledging the superiority of fingerling fish for stocking waters successfully. Young fry are too risky. The growing demands for fingerling fish for stocking purposes, by those who can appreciate the incomparable benefits derived, is very gratifying. There is no speculation in this method of planting fish. It is high time that the citizens of this State should understand clearly and precisely how this matter affects them. The stocking of waters with fish fry is clouded with too many uncertainties, as to be egregiously disappointing. So the true difference, then, between the two methods of stocking waters is this: First stocking with fingerlings means success, while stocking with fish fry a step backward, a precarious uncertainty, a happy-go-lucky system.

Common prudence must therefore suggest that by stocking waters with fingerling shad, trout and salmon will disperse any cloud of uncertainty, remove in the most efficient manner the most cherished illusions attending the fry planting, and at one remorseless blow discontinue the planting of practically helpless minute fish fry. These remarks may appear singularly blunt and bold, but by the present system of stocking the waters of the State there is no such word as failure. It should be remembered what fish propagation means to us as a State; the cheap, healthful and abundant food for all classes of its people; the livelihood for the hardy fisherman; the industrial prosperity of many sections of our State; mental relaxation for the toiling masses of our cities and towns in all the busy pursuits of our intense and intensifying daily life; that these and many other objects of vast importance, socially, morally and financially, are involved in trying to preserve and maintain for the enjoyment of the present and future such food fish as are adapted to our waters. Fish propagation and protection means much to the people of this State. The opponents of fishculture find it always easier to criticise than to create. With requisite means and appliances, the successful breeding of shad, salmon and trout, the waters of this State can be stocked as never before since the Revolution. Sometimes it has been charged by those who have not given the subject careful consideration, that this Commission is largely engaged in propagating game fishes for the few at the expense of many. An examination of the tables herewith submitted in this report will prove the absurdity of the charge referred to. It should be taken into consideration that the so-called game fishes are the highest order of fishes, and that the love of angling is on the increase. The people from the farm, shop, store, factory, pulpit, studio, counting-room and court find a healthy relaxation from their cares in angling. The commercial fisherman and angler both have their right, which we are bound to respect. The whole people must be considered in the matter of propagating and planting fish in the waters of the State. Too often we hear the misleading statement: "Let nature take its course and we will have more fish."

Agriculture is not the development of such immeasurable antiquity but what the tiller of the soil knows that to reap he must sow. Whenever human knowledge is broadened by investigation and careful consideration, much good results. A given area of land compared with the same area of water for food producing power, the argument is in favor of water. The soil is tilled, it is prepared for seed, it is watched constantly until the crop is garnered, it is marketed, all at the cost of effort and means. As to the waters from which fish are taken, the seed is sown and it grows to maturity under natural conditions and practically at no cost. We have men in this State who urge that it is useless to hatch shad to be caught beyond absorptive capacity of the markets, but it should be understood that with the perfect refrigerating appliances and improved facilities of transport of the present day, there need be no fear but what the shad fishermen may reap their harvest and the toiling masses be able to buy shad at most reasonable prices. Our fruits

and vegetables, under judicious and enlightened culture, have undergone astonishing improvements during the past fifty years, and the promise of the future is far greater than in the past. Having moulded animal and vegetable forms to nearly our taste, the same can be done with our fishes. The great advantage in propagating fish is that their eggs are isolated from their enemies until they are born fish. The fact of the matter is, when an egg is deposited on a natural spawning bed that egg is absolutely helpless—it is unprotected. The storms come and stir up dirt, leaves and other debris from the bottom, and a large proportion of the eggs are covered, which means death to the embryo. In addition to that, if there is a choice morsel for any fish, it is the eggs of its own or the eggs of some other variety of fish. By artificial propagation the eggs are free from their enemies and a greater percentage is saved by artificial means.

We will briefly describe the shad retaining ponds, as it may interest many readers remote from the State's shad preserve. These ponds are situated in Joshuatown, in the town of Lyme. There are four ponds in a chain, of about twenty acres, fed by a cold mountain stream, which has its source many miles back in East Haddam. The ponds are within one mile of the Connecticut River. No better place could have been selected. In 1897 we carried over 6,000,000 of shad fry into the ponds, from May until Oct. 20, that year, when they were liberated fish from 3 to 5 in. in length. In 1898 we carried 9,600,000 shad fry, from May to Oct. 20. We adopted the plan of feeding the young shad this year, and fed many barrels of pulverized crackers to them, with good results. The drawing off of these ponds is easily done, as the sides of the ponds slope toward the center, and the process is made very easy, and as their dripping banks slowly come in view it is intensely interesting to see countless numbers of young shad pass out in silvery masses on their migratory journey of life.

That hundreds of thousands of these shad turned out of the retaining ponds will return to our waters in three and four years is beyond dispute. It is just as sure as the planting of corn; if the conditions are right the corn can be plucked in a certain time. It has been thoroughly demonstrated on the Pacific Coast that rivers that had never before contained a shad, after having been stocked, in three years the shad returned, and have yearly ever since their first appearance.

We maintain that the grand old State of Connecticut, with its lofty hills, with its beautiful valleys, with its picturesque mountains, with its sparkling lakes, with its health-giving breezes, needs but plenty of fish and game to make it still more attractive to summer and fall visitors of other States. These people spend their money freely, and for every pound of fish taken they will probably leave \$2, and for every game bird shot the same amount.

When to these sources of revenue we add the yearly value of fish caught from our waters and served as food on the tables of the households within the State, the importance of our fish products are impressed upon the attention.

Canadian Salmon Rivers.

FOLLOWING are letters of suggestions relative to salmon rivers, recently sent to the Canadian authorities:

SEPT. 8.—L. Z. Joncas, Esq., Superintendent, etc., Quebec, Canada. Dear Sir: I greatly appreciate the friendly spirit in which you and the department have conducted our correspondence concerning the preservation of salmon, and feel that the point of view (in your report to the Commissioner, of 1897) from which you regard these matters of the protection of game and fish is a correct one. I venture to say that it is fortunate for the Province that at a critical period you should have been placed in charge of these interests.

One suggestion I desire to call to your attention. As to your estimated figures of \$60,000 or \$70,000 annual revenue under thorough protection from the salmon rivers. I do not mean that the figures which I am about to mention can be attained this year, or for five or six years, perhaps, but I venture to say that if you had said \$300,000 or \$400,000 per annum you would not have overstated the true rental value of the salmon fisheries to the Province, nor the figures to which they may readily be made to attain. The Scotch, English and Irish figures amply justify this conclusion. I do not, of course, refer merely to leasing the rivers to anglers, but to the leasing under well-enforced rules as to the times and methods of taking fish and as to netting privileges.

The great trouble has been that the latter have been granted and exercised recklessly, so that the supply has so diminished that no one can afford to pay large sums as rental for the taking of a few fish by angling. The Esquimaux, for instance, could again yield its 50,000 salmon per annum, and continue to yield that number indefinitely, and the other rivers in like proportion if the nets were allowed to be set only one-half of the time. It would be no hardship to netters to be compelled to use nets which could be lifted to the tops of the stakes once in each week, and if the Province should adopt three days (preferably Monday, Tuesday and Wednesday) in each week, and let all the fish on the other days proceed up the rivers, the netters would find in a few years that on their three days a week they were taking two fish for every fish which they had formerly been able to take with nets set nominally six, actually seven, days a week, as they are at present. Also, those holding netting privileges near the mouth of an unleased river should be required to guard the pools and spawning beds in the river, and this guardianship should not be permitted to be perfunctory, but should be an actual and efficient guardianship. Salmon, except that they find their food in the water, scarcely differ in relation to the methods appropriate to "farming" them from sheep or cattle. A farmer who killed all his milch cows or all his bearing ewes in any one year would be regarded as having lost his mind, and that the holder of a permanent netting license near the mouth of a river should similarly conduct himself as to salmon is only possible through the gross ignorance that prevails in relation to the simplest matters concerning the natural history of the fish.

There is, I think, no doubt in your mind but that there are to-day within the Province of Quebec 100 salmon rivers which are now wholly depleted, and which could

be restored in five years at small expense, if the westward stream of salmon was allowed to reach them; nor is there reason to doubt but that failure along the coast further to the eastward to properly protect necessarily involves the destruction of the westward rivers.

There are four distinct elements in the proper protection of a river:

1. The coasts from the mouth of the river eastward to the ocean must be protected.
2. The river itself must be guarded.
3. There should be no nets in the estuary itself.
4. There should be regulation of the sale and purchase of salmon.

The lack of any of these elements militates gravely against a given river's productive capacity. I remain,

Yours very truly,

(Signed)

CHAS. STEWART DAVISON.

SEPT. 8.—Hon. S. N. Parent, Commissioner of Lands, Forests and Fisheries, Government Buildings, Quebec, Canada. Dear Sir: In pursuing investigations in relation to your salmon rivers, I have been much struck by the absence of all statistics from your hatcheries. The reports of the Commissioner of Crown Lands for the Province of Quebec for the years ending June 30, 1894, 1895 and 1896, and your report as Commissioner of Lands, Forests and Fisheries of the Province of Quebec for the year ending June 30, 1897, do not appear to contain either a list of what hatcheries are supported by the Province, nor any statement of the expense of conducting the various hatcheries, nor any details of the number of fry and parr raised at each hatchery or in the aggregate, nor what disposition was made of them. These are all matters of great interest, not alone to anglers, but also to those who have to deal with salmon commercially, and the absence of all information on the subject, with the consequent impossibility of deciding on the utility of the hatcheries, either at large or in any particular locality, is naturally a source of regret.

There are certain statistics as to hatcheries which could be readily furnished by those in charge, and which would be of great value. Indeed, it would appear almost essential that every hatchery should furnish the department annually with an official return covering primarily the following points:

1. The total number of fish taken by the hatchery's nets during the entire season.
2. The character, location and dimensions of the net.
3. The dates on which the net was set.
4. The number of fish taken on each date on which the net was set.
5. The heaviest and lightest fish taken on each day (hen and male respectively).
6. The number, weight and sex of fish taken on each date from the net either dead or so injured that they were killed and sold.
7. The same particulars as to those returned alive to the water as being unnecessary for the hatchery's purposes.
8. The number and gross weight (with roe) of each hen fish retained.
9. The net weight of each hen fish (after spawning).
10. The number of hen and male fish respectively which were on each date returned to the water after spawning and milting.
11. The number of eggs taken on each date.
12. The number of fry produced from them.
13. The number of fry raised to the age of three months and one year respectively.
14. The number of fry and parr respectively placed in different streams, with full, appropriate data in relation thereto (dates, localities, etc.).

Such particulars as these should be supplied by every hatchery and could be made readily accessible to those interested by their publication in your annual reports. Supplied with these details, one could institute a series of comparisons with the figures attained at other hatcheries and also with the particular results attained at any given hatchery. Yours respectfully,

(Signed)

CHAS. STEWART DAVISON.

Winter Fishing.

ENGLISH CENTRE, Pa., Jan. 20.—It is reported by eye-witnesses that the law-abiding citizens of English Centre and vicinity who are lovers of sport of one kind or another, since all game fish, except the common black sucker, is now protected by law, are having considerable sport, and are securing some fish also. It is not an uncommon sight to see from ten to twenty men and boys on the ice at one time after suckers, which here in the pure spring water of our streams grow large and lose all that muddy taste for which they are noted in warmer river water, where there is mud in plenty. They are a palatable fish, leaving the bones out of the question. The fishermen cut holes in the ice, and with hooks made out of 3-16 in. wire jerk the unsuspecting fish out of the water on to the ice. The man who, when advertising his fishing grounds here, said, "Some of the trout have spots on them as big as a silver dollar, they're so large," says of the sucker fishermen: "They are carrying these suckers from the creek by the arm load, these cold days. They just pile them up on their arms like stove-wood, and away they go with them." NEMO.

A Pickerel Party.

DR. GEO. McALEER, of Worcester, sent out last week to the elect an unique card of invitation, which read: "To ye Anciente and Honourable Guild of Fishermen of ye Town of Boston, on ye Massachusetts Bay: Ye fellowcraft member, Dr. George McAleer, of ye Quinsigamond Plantation, now called ye Hearte of ye Commonwealth, sends Greeting, and warns ye brotherhood to meete in his goodie citie January 28th, Anno Domini 1899 to make ye day merrie fyshinge through the ice for ye Pickerel."

"For ye dispoite he will furnish all ye tilts and bait, but ye Brotherhood will bring emptie stummicks and chunks of fun to make divertisement in plentie."

"Nota Bene.—To ye best storie goes ye biggest fyshe."

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

A Minnesota Ice Raid.

WABASHA, Minn., Jan. 17.—*Editor Forest and Stream:* During the winter season I occasionally drive over Lake Pepin. A few days ago, while driving across the lake, I counted about forty fishing shanties. Yesterday I had occasion to go over again, and as I drove onto the lake no fish shanties were to be seen, and I could not imagine what had become of them. It was soon explained to me by two fishermen, who were stumbling by the charred remains of one of the shanties. The redoubtable Sam Fullerton, Minnesota's famous game warden, had been making a raid, and as these fellows said, "cleaned 'em out." He swooped down on the whole outfit and began to burn the shanties, burning and destroying a large number, also many nets, which he hauled up from under the ice. No such raid had ever been made on Lake Pepin before. The fishermen were paralyzed, and made no resistance at all; but there was a fisherwoman in one of the shanties who did. She defied Sam to touch her or the shanty, and she wouldn't budge; said she was a poor woman and depended on the fish she caught for a living. Sam said he was not after fisherwomen, and did not molest her; but she moved her shanty off the lake a short time after.

Mr. Fullerton was very careful to remove all property out of the houses, or to have it removed, even to the stove wood, before destroying them; and acted as I understood very gentlemanly to all; but the fishermen swear vengeance, and I am told will have Mr. Fullerton arrested. This, I am told, he expects them to do. But netting and spearing fish in Lake Pepin has ceased for a time at least.

WABASHA.

Auger Boring through Ice.

Editor Forest and Stream:

I have been experimenting lately in boring through the ice with an 1½ auger. I succeeded after a little in boring through where the ice was 12 in. No doubt there is something more to be learned about the modus operandi than my experience has taught me. If this interests any others I will be glad to tell what I know from experience, and hope others will tell us the proper way to file an ordinary auger bit to make it chip the fastest.

A Lake George man told me the fishermen there bored through the ice and fished through the holes. He gave me a few pointers, which enabled me to go through the 1 ft. of ice here.

A returned Yukon man was telling me of a miner in that country who got water by boring by hand with an auger. His plan was this: To cut a "cup" or small reservoir in the ice as deep as was convenient to go, and then bore the rest of the distance to the water, which would boil up and completely fill the reservoir. This would freeze over every night, but by cutting away what had frozen last the water continued to come up through the hole (of course only enough to fill the hole) as it was bailed out for use.

Of course an ordinary auger bit not filed for the purpose will not bore.

I hope to hear from others about their methods, and to learn whether or not it is practiced to any extent in fishing.

HEATHCOTE.

Game and Fish Protection.

New York Legislature.

Special correspondence of Forest and Stream.

ALBANY, N. Y., Jan. 23.—The following measures have been introduced to the New York Legislature to amend the game law:

In the Senate.

No. 4, by Mr. Coggeshall.—A bill authorizing the Commissioners to erect a fish hatching establishment on the Beaver Brook, in the town of Trenton, Oneida county; appropriation of \$6,000.

No. 47, by Mr. Chahoon.—To amend the deer law so as to change the present season, Aug. 15-Nov. 15, to Sept. 20-Oct. 20, and providing that deer shall not be killed at any time when in the water; limiting the number of deer taken by one person to two in a season. Season for possession and sale of venison, Sept. 20 to Oct. 31; venison not to be sold at any time within this State, unless proved by the seller that it was killed outside of the State. Hounding permitted from Sept. 20 to Oct. 20. Transportation of deer limited to one carcass (instead of two) accompanied by owner.

No. 53, by Mr. Humphrey.—Providing a close season for the counties of Allegheny, Livingston and Wyoming on hares and rabbits from Dec. 15 to Sept. 1, and forbidding the use of ferrets.

No. 92, by Mr. Chahoon.—To correct the blunder in section 74, which now reads, "No person or persons shall kill more than thirty-six of the above-named birds," namely, woodcock and ruffed grouse, to read, "No person shall kill more than thirty-six of each of the above-named birds." Also amending section 76 so as to forbid entirely the transportation of woodcock and ruffed grouse or quail, whether or not killed in the State.

No. 106, by Mr. Coggeshall.—Amending section 74 so as to shorten the open season for woodcock and ruffed grouse to Nov. 15, making the season Sept. 1 to Nov. 15, and omitting the restriction of thirty-six birds to an individual. Further amending section 75 so as to make the season for possession of woodcock and ruffed grouse Sept. 1 to Nov. 30, and providing that birds shall not be possessed or sold during the last fifteen days of November unless it can be proved by the possessor or seller that the birds were caught or killed within the lawful period for killing the same, "or from out of [sic] the State when not in violation of the laws of the State or the county from which they were brought."

In the Assembly.

No. 44, by Mr. Mason.—Appropriating \$6,000 for a hatchery on Beaver Brook, in Trenton, Oneida county.

No. 73, by Mr. Gould.—To repeal the net bounty law.

No. 110, by Mr. Pickett.—To make the deer season

open Oct. 1 and close Oct. 31. One person to take one deer only in a season. Possession allowed Oct. 1 to Oct. 31, but permitted until Nov. 5, if venison was lawfully killed. Forbids the killing of does at all times. Permits hounding during the month of October.

No. 125, by Mr. Beede.—To make the open season on deer Sept. 20 to Oct. 20; no deer to be killed at any time when in the water. Adds the penalty of imprisonment in the county jail for ten days as alternative of \$100 fine, or both. Venison to be possessed from Sept. 20 to Oct. 31. Venison not to be sold at any time within the State unless it can be proved that the venison was killed out of the State. Hounding permitted from Sept. 20 to Oct. 20. Transportation of venison limited to one deer, accompanied by owner.

No. 139, by Mr. Hallock.—Relates to Long Island only. To make close season for ruffed grouse and quail from Jan. 5 until the end of the close season, and possess-Forbids trapping during this period. Forbids possession from Jan. 5 until the end of the close season and possession during the first five days of January forbidden unless it is proved that the birds were killed within the open season on Long Island.

No. 154, by Mr. Dutton.—To repeal the net bounty law.

The Kennel.

Fixtures.

BENCH SHOWS.

Feb. 8-11.—Milwaukee, Wis.—Bench show for the benefit of the Wisconsin training school for nurses. E. J. Meisenheimer, Sec'y.
Feb. 21-24.—New York.—Westminster Kennel Club's twenty-third annual show. Jas. Mortimer, Sec'y and Supt.
March 7-10.—Grand Rapids, Mich.—Butterfly Association's bench show. Miss Grace H. Griswold, Sec'y.
March 14-17.—St. Louis, Mo.—St. Louis Kennel Club's show.
March 21-24.—Chicago.—Mascoutah Kennel Club's show.
April 4-7.—Boston, Mass.—New England Kennel Club's bench show. James Mortimer, Manager.
Nov. 22-24.—New York.—American Pet Dog Club's show. S. C. Hodge, Supt.

FIELD TRIALS.

Feb. 6.—Madison, Ala.—Alabama Field Trial Club's third annual trials. T. H. Spencer, Sec'y.

United States Trials.

WEST POINT, Miss.—*Editor Forest and Stream*: The United States Field Trial Club held their trials at West Point, Miss., commencing Monday, Jan. 16. The attendance of sportsmen was numerous; there were many from all over the United States. The Derby did not have as many starters as will reimburse the club for the money the club pays out in purses. The two stakes will be consolidated in the future in consequence. This year will see an end of setter and pointer Derbys.

Pointer Derby.

The pointer Derby, the first stake, had seven starters. First brace was Recreation and Maude S. The immense rainfall of last week and Sunday night made the fields a sea of mud and water, so much so that the handlers all rode; they could not have handled and walked, as the mud and water were too great. There was only one bird seen when this brace was down. Recreation nosed about it until it was flushed. Maude S. tracked Recreation most of the time and gave tongue.

Zepher and Ladd of Jingo were the second brace down. Jingo roared an outlying bird of a bevy, pressing it too close when it flushed, and the flushed bird caused the bevy to follow it. The dogs were sent after the flushed bevy, and each made some points on the single birds. Following single birds to second flight, each dog made two points. Jingo was drawing on a second bevy, which was near a road the horsemen were on; and they rode into and flushed before the dog had pointed. The birds going to bare cotton field and very boggy were not followed.

Sadie C. and Nana were the next brace. Nana made some points on single birds. Both dogs were very near to the bevy, which was seen to rise. Sadie lost her head and flushed and chased a bevy. Nana pointed one or two single birds Sadie failed to flush. Sadie had plenty of speed and hunted with judgment, but lost her head and flushed many birds she could have pointed.

Rana had the bye, and ran alone. She pointed a bevy and made some points on single birds. She did no flushing. She has good speed and range, and used her nose.

Four dogs were carried into second series. Ladd of Jingo ran with Nana. The contest between these dogs was close. They did some good point work. Jingo had some advantage in hunting out his ground with most judgment, both had fair speed and range. Zepher and Rana was the second brace in second series. Rana did the most point work, pointing three bevies to Zepher's one. Zepher was the fastest at first, but her speed died away as the heat progressed.

Rana was first, Ladd of Jingo second, Nana third. The pointers competing were an average lot.

The Setter Derby.

The setter Derby had nine starters, and was commenced on Tuesday morning. The fog was so dense the dogs had to be held until 11 o'clock before the fog lifted so the dogs could be seen. Nightingale and Lady Rachel were the first brace. Nightingale made a point on bevy and had moderate range and speed. Rachel could not be seen often; she ranged at will, and failed to work the only birds she was seen near. She is very fast, the fastest in the stake, and when brought under control will make a good dog.

Roderick Dhu and Colonel R. were the next brace. Colonel pointed a bevy, Dhu backing. Out on the single birds each scored a couple of points. The Colonel pointed another bevy that was not followed; both fast and ranged well.

Lena B. and Royster were the next brace. Royster pointed a bevy that had been feeding in the corn near by. The flushed bevy was followed and several points made by Royster on the single birds, Lena B. scoring some also.

Count Danstone and Pink Boy were the next brace. Danstone roared quite a lot in the woods. So did Pink,

but no birds were raised. In the woods Danstone pointed a bevy. Pink roared quite a lot, but did not locate any birds. Both dogs roared by a bevy on hillside; they ought to have pointed, the handlers walking them up.

Prime Minister had the bye; he pointed a bevy and one or two single birds and made a good heat.

Second Round.

Seven dogs were carried to second series. Four would have been enough on work done. Colonel R. and Royster were the first brace in second series. Colonel pointed a bevy; one of the flushed bevy Royster pointed. Colonel pointed and chased a rabbit. In a pasture Colonel pointed a bevy and made four points on the flushed bevy. Royster in same pasture pointed a bevy and some single birds.

Pink Boy, the bye dog, pulled himself together and made a splendid race, finding six bevies, and doing work on single birds when they gave him a chance.

Pink Boy and Colonel R. ran together in third series, Colonel having the advantage in speed and range.

The judges announced Colonel R. first. He is a very promising puppy, speedy, good range, and handled his birds with care, and is liable to train on.

Count Danstone, second, is a fast, quick dog; he runs with his head too low at times; he is quick in his decisions.

Pink Boy, winner of third, is a large, handsome dog, good enough in appearance to meet competition on the bench; is a trifle lazy in his going. In his first heats he drew a great deal; in the last he located promptly.

Absolute Heat.

The setter Absolute was run off between Colonel R. and Nana on Thursday morning. Colonel lost his head and flushed two bevies he ought to have pointed. Nana cut loose and made a great race, outpointing the setter and winning with something to spare. She ran a decided improvement over any heat she ran in the Derby. The ground was better and the day was better in every way for high class work. Birds were plentiful enough for all purposes.

All-Age Stake.

The All-Age Stake had eighteen starters. The first brace down was Don and Young Jingo. Don bolted and could not be found for quite a while. The next brace completed their heat when Don and Jingo resumed theirs. Jingo pointed a bevy. On the flushed bevy each scored a point. Don roared a single bird until it flushed. Jingo pointed another bevy. In speed both were good; but Don showed too much range, getting away and could not be found.

Joe Cummins and Rowland were the second on the card to run. They both started out to find birds, and they did this so rapidly the spectators could not note all of the points as fast as the dogs made them. They scored three bevies each and any number of single birds, with no errors except that Rowland did not back on one occasion. This brace set a high standard for the guidance of the judges in passing on the other dogs that ran.

Turnous and Pearl R. ran a fine heat on the part of Pearl R. She did all the point work, finding four bevies. She is stylish in her work and snappy on her game, with good speed.

Lena Belle and Sport McAllister concluded the running for the day. Each pointed two bevies; it being very late, and as the bevies flew back, they were not followed for work on single birds. In speed they were equal, in range Sport had some advantage.

Belle of Hardbargain and Dave Earl were the first brace Thursday. Both started out well and ranged wide and fast; both pointed larks; each pointed a bevy. Dave made an excusable flush.

Gold King and Uncle B. were next brace. Uncle ranged so wide he was out of sight often. He did no work on birds. Gold King pointed a couple of bevies and a single bird. He has only fair speed and range. Uncle B. was fast, but did not put his speed to use in finding game.

Enoch Arden and Pickle ran a heat together. Enoch failed to do any point work, though he ranged out of sight often. Pickle pointed a couple of bevies and two single birds. Pickle has fair speed and range, and worked her game well.

Peconic and Hal Pointer were the next brace. Peconic found four bevies and pointed some single birds. Hal did not find any bevies, but pointed four single birds; he had fair speed and range, and handled game well.

Dot's Roy and Pin Money were the last brace of the day. Dot's Roy pointed two bevies and made quite a score on single birds, more than any dog that ran today. He ran a great heat, committing no faults. Pin Money was lost on two occasions; and she was found pointing a bevy; another time she was found by some one; her range was too wide, and she did not hunt to the gun; was behind her handler at times. She did not improve the opportunities to point she had on single birds in this heat, Dot outpointing her.

Second Round.

The following dogs were carried into second series:

Joe Cummins with Dot's Roy.

Roland with Pin Money.

Don with Lena B.

Pearl R. with Pickle.

Joe Cummins and Dot's Roy were the first brace down Friday. Joe started out by flushing a bird of a bevy, the bevy following the flushed bird soon after. He pointed a bevy in corn that flew to sedge; on the flushed bevy each dog scored three or four points. Roy pointed a bevy that flew with the one just worked on, and lit on a hillside. The dogs had a hot time pointing the single birds of the two bevies. Dot is a glutton when it comes to working on game, and does not get enough easily. It was "point judges" in such rapid succession the judges had to think fast. It was grandstand play and in full view of the spectators. Joe wavered, then he commenced to back Dot too much. Dot then ran up a score, in connection with his splendid score of yesterday, no dog equaled in the stake.

Roland and Pin Money were second brace in the second series. Roland ran a splendid heat with Joe Cummins the first series. He was off to-day and could do no point work. Pin Money made a better race than yesterday; though often hunted in dense woods, she was

not lost, as yesterday. She did all the point work but one point by Roland, pointing bevies and a few single birds.

Don and Lena B. were next brace. Don seemed to think a straightaway run down the road a half mile to a creek in a cotton field was the first thing to do. When he was finally gotten back he flushed the birds he came to, two bevies. Lena pointed three bevies. Don had worlds of speed and range, but in this heat he put them to no use. Lena has good range and fair speed.

Pearl R. and Pickle went down after lunch on grounds that had afforded ample birds the two previous days. This was the third consecutive day they had been chased, and they had gone on a visit elsewhere, and were not found. Pearl found only two bevies and pointed one single bird. Pickle made no points. Each had fair speed and range.

Final.

Jingo and Sport McAllister were the last brace that ran. Like the preceding brace, the grounds they ran over had been used too often and the birds were not found. Sport pointed one bevy and Jingo another. Both had all the speed and range needed, and hunted out the ground well. Still a few men walking walked up to two bevies the dogs did not find.

Dot's Roy, who won first, belongs to the Avant Thayer and Duryea Kennel, of Hickory Valley, Tenn. He is a small English setter of good speed and range, with fine judgment, finding more bevies than any dogs he ran with; also outpointed them on single birds; is quick on his birds and makes few mistakes.

Joe Cummins belongs to W. W. Titus, of West Point, Miss. He is a medium-sized dog, puts more vim in his work than any dog that ran, is quick on his game, splendid speed, and ranges well and hunts to the gun.

Pin Money belongs to Edward Dexter, of Boston, Mass. She is a small English setter, has more speed and range than any dog in the stake—too much range at times. She ranges too much at will and not enough to the gun. Is as fast when she quits as when she starts out.

The club held an election and elected the following officers for the year: H. B. Duryea, of New York, President; Norvin T. Harris, of Louisville, and Edward Dexter, of Boston, Mass., Vice-Presidents; W. B. Stafford, of Trenton, Tenn., Secretary and Treasurer. The club will have setter and pointer Derbys, as usual, but the stakes will not be so large as has been, all stakes being reduced \$100, making the stakes \$400 instead of \$500, as heretofore. West Point, Miss., will be the place the trials will be held.

P. H. BRYSON.

Irish Setters at New York.

NEW YORK, Jan. 21.—*Editor Forest and Stream*: The Irish Setter Club of America offers these specials for the coming show of the Westminster Kennel Club: Five dollars each for best Irish setter dog and bitch in limit classes; \$5 for second best of each; \$5 for best Irish setter dog and bitch owned by lady member of the club; \$5 for second best; also \$5 for best dog or bitch owned by member of the club.

Mr. F. G. Goodridge offers \$15 for best American bred Irish setter bitch belonging to a member of the club.

These specials are open only to members whose dues for 1899 are paid by or before the close of entries, viz., Feb. 6, 1899. Applications for membership should be made as soon as possible to Geo. N. Thomson, Sec'y-Treas., 938 Prospect avenue, New York city.

Trap-Shooting.

Fixtures.

Jan. 25.—Singac, N. J.—Twenty-five live-bird handicap, \$10 entrance, birds extra. Arthur Bunn, Manager.

Jan. 28.—Brooklyn, L. I.—Brooklyn Gun Club's monthly shoot at targets. John Wright, Manager.

Feb. 1.—Berry's Creek, N. J.—Bergen County Handicap, first contest, on Dunkerly's grounds.

Feb. 4.—Lyndhurst, N. J.—Tournament of the Lyndhurst Shooting Association. Main event, Money vs. Morley, for the E. C. cup and championship of New Jersey. T. W. Morley, Sec'y.

Feb. 13.—Pawling, N. Y.—Tournament of the Pawling Rod and Gun Club; targets. Geo. S. Williams, Sec'y.

Feb. 8.—North Paterson, N. J.—Bergen County Handicap, second contest, on Lee's grounds. Middlesex Park.

Feb. 15.—Bergen County Handicap, third contest, 15 live birds, open to all, \$10 entrance, birds included, at Helfrich's Hackensack Bridge grounds.

Feb. 22.—Rochester, N. Y.—Live-bird and target shoot of the Rochester Rod and Gun Club.

Feb. 22.—Lebanon, Pa.—Keystone Gun Club, of Lebanon, Pa., all-day live-bird and target tournament; open to all. A. E. Smith, Captain.

Feb. 22.—Altoona, Pa.—Target tournament of the Altoona Rod and Gun Club. G. G. Zeth, Sec'y.

Feb. 22.—New Haven, Conn.—New Haven Gun Club's tournament; \$20 added money. J. B. Savage, Sec'y.

Feb. 22.—Worcester, Mass.—Tournament of the Worcester Sportsmen's Club; targets. A. W. Walls, Sec'y.

Feb. —Lyndhurst, N. J.—Live-bird tournament of the Brooklyn Gun Club. John Wright, Manager.

March 1.—White Plains, N. Y.—Fifteen live-bird handicap, \$10 entrance, birds included. E. G. Horton, Manager, White Plains.

April 4-5.—Chambersburg, Pa.—Chambersburg Gun Club's spring live-bird and target tournament; open to all. J. M. Runk, Captain.

April 6-8.—Utica, N. Y.—Fulford's handicap at live birds. E. D. Fulford, Manager.

April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament.

April 18-20.—Lincoln, Neb.—The Lincoln Gun Club's second annual interstate tournament; targets and live birds; \$500 added. Geo. L. Carter, Sec'y.

April 18-21.—Baltimore, Md.—Prospect Park Shooting Association's tournament; \$500 added. Stanley Baker, Sec'y.

April 25-28.—Baltimore, Md.—Tournament of Baltimore Shooting Association; targets and live birds; money added. Geo. L. Harrison, Sec'y.

May 16-19.—Erie, Pa.—Ninth annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Reed Hurst Gun Club. Frank W. Bacon, Sec'y.

May 16-20.—St. Louis, Mo.—Tournament of the Missouri State Fish and Game Protective Association. H. B. Collins, Sec'y.

May 24-25.—Greenwood, S. C.—Annual live-bird tournament of the Greenwood Gun Club; 25-bird Southern Handicap. R. G. McCants, Sec'y.

June 7-9.—Columbus, O.—Tournament of the Ohio Trap-Shooters' League, under the auspices of the Sherman Rod and Gun Club. I. C. Porterfield, Sec'y, O. T. S. L.

June 7.—Buffalo, N. Y.—New York State shoot, under auspices of the Buffalo Audubon Gun Club. Chas. H. Bamberg, Sec'y.

June 14-16.—Cleveland, O.—Cleveland Target Co.'s tournament.

June 20-22.—Sistersville, W. Va.—Third annual tournament of the West Virginia State Sportsmen's Association, under the auspices of the Wheeling Gun Club, Wheeling, W. Va. John B. Garden, Sec'y.

DRIVERS AND TWISTERS.

The Rochester Rod and Gun Club has issued the following card concerning its Washington's Birthday shoot, on Feb. 22: "The Rochester Rod and Gun Club proposes to hold a tournament at live birds and targets on Feb. 22. Live birds at 15 cents and targets at 1 cent each. Dead birds go to the shooters. It is proposed to make this the most interesting shooting event of the new year. Make no other engagement for that day. Amateurs will be protected. Full programme of events will be mailed later. Club secretaries are requested to notify members. All sportsmen invited."

A silver cup, presented by Messrs. Helfrich, Lee and Dunkerly, will be the prize to be shot for in a 15 live-bird handicap, to be called the Bergen County Handicap, entrance \$10, birds included. The winner at each shoot holds the cup, but the one winning it the most times becomes the owner. This handicap is open to all. The first shoot takes place at Berry's Creek, N. J., Feb. 1, on Dunkerly's grounds; the second on Feb. 8, on Lee's grounds, Middlesex Park, North Paterson, N. J., and the third takes place on Feb. 15, at Helfrich's Hackensack Bridge grounds.

Messrs. Hartley & Graham have some souvenirs of the American and Spanish team contest in the shape of a limited number of Mauser rifles and cartridges captured in the memorable event at Santiago, Cuba. The rifles and carbines boxed are offered by them at \$7.50; Mauser cartridges, per box of fifteen, 75 cents. A certificate of genuineness, signed by Messrs. Hartley & Graham, will be given with each arm.

The amateur championship contest under the auspices of the Carteret Gun Club will take place on Feb. 22 and 23. The conditions are 100 live birds, \$100 entrance, 30yds. rise. It is open to members of the Carteret, Westminster Kennel Club, Country Club of Westchester, N. Y., Herron Hill Gun Club, Riverton Gun Club, Philadelphia Gun Club and other high grade amateur gun clubs of the country.

Mr. Jack Fanning, after an absence of nearly two years, left for his home, in San Francisco, Cal., in the early part of this week. In that time he has made a host of friends, and built up a large business interest for his company. Jack is one of the few men who shoots without a repertoire of excuses. He doesn't need them. He will be in attendance at the Grand American Handicap.

We are informed by Mr. E. G. Horton that Mr. Edward Banks has consented to handicap the contestants of the Westchester handicap, fixed to take place at White Plains, N. Y., on March 1. This will without doubt please all entries, as Mr. Banks is very popular with all the shooters. Announcement as to trains, etc., will be made later. Mr. Horton's address is Box 81, Pleasantville, N. Y.

Mr. E. C. Meyer, president of the Rochester Rod and Gun Club, was in New York this week, and mentioned that the wing-shots in his city and vicinity were taking great interest in the forthcoming Grand American Handicap, and that without doubt a number of them would compete in the greatest shooting event of America.

Mr. W. L. Colville informs us that his engagement with Messrs. E. I. du Pont de Nemours & Co. begins on Feb. 1, and that he will travel in the Eastern, Middle, and Southern States, representing his firm's interests generally. His permanent address will be Batavia, N. Y.

Capt. J. A. H. Dressel and U. M. C. Thomas, of the Union Metallic Cartridge Co., and Mr. J. S. Newell, of the U. S. Smokeless Powder Co., of San Francisco, were among the distinguished visitors at the E C cup shoot at Holmesburg Junction, Pa., last week.

Mr. H. L. Edgerton, of Willimantic, Conn., famous as a trap shot, has had an outing in Virginia, his sport being with the quail, which there abound. He passed through New York en route for his home on Tuesday of this week.

The Committee on Rules of the Interstate Association completed its labors on Monday of this week. It perfected a set of rules both for target and live-bird shooting. We will be able to publish them in full in our next issue.

The noted wing-shots Capt. A. W. Money and C. S. Guthrie on the one side shoot a match against Messrs. G. S. McAlpin and R. A. Welch on the other, 100 live birds per man, at Carteret on Thursday of this week.

On Tuesday of this week Messrs. J. A. H. Dressel, Edward Banks and Elmer E. Shaner visited Elkwood Park to make the final arrangements for the holding of the Grand American Handicap at that place.

In respect to the charge of powder used by Miss Annie Oakley in her recent match with Mr. Chas. Munson, we were mistaken in the statement of the kind used, it being Schultze, not E. C.

Mr. W. R. Fieles, of Christiana, Pa., one of the oldtime shots, and one of the best at any time, was a competitor in the tournament at Holmesburg Junction last week.

The Ideal Manufacturing Co., of New Haven, Conn., have issued their "Ideal Handbook, No. 11," to which they have added several pages of new matter.

The Lyndhurst Shooting Association, Mr. T. W. Morfey, manager, has recently put in a first-class set of live-bird traps on its grounds.

The Oceanic Gun Club, recently formed, will hold a team race with the Hudson Gun Club, Feb. 6, at Rockaway Park.

The first entry of the Grand American Handicap was made by Mr. B. H. Norton, of the Hazard Powder Co.

BERNARD WATERS.

Trap at Holmesburg Junction, Pa.

JAN. 21.—The grounds of the Keystone Shooting League, at Holmesburg Junction, Pa., were the scene of rare shooting activities during the past week, both in respect to practice shooting and to actual competition.

The main event was the contest between Messrs. E. D. Fulford and Rolla O. Heikes, for the E C cup. Following it the next event in interest was the five-men team contest between teams representing Greater New York and Philadelphia. There was also a regular programme of ten events, alternating at 15 and 20 targets, \$1.25 and \$1.50 entrance respectively. The Philadelphia team was picked from the men making the highest averages in the first five events of the aforementioned, the total number of targets on which to base their averages thus being 85.

The weather was clear and comfortably cold, conditions which were in favor of good scores. There was not any wind worthy of consideration.

The targets were thrown very fast, and their flights in many instances were deceptive. While the scores may seem low, under the conditions in which they were made they are not low at all. During the week, the experts who were practicing found that it was impossible to make their usual high averages, and that they were all shooting relatively much as they did at other times and places, thus, while there was a falling off in their scores, their relative skill remained much the same. There was a large crowd present to see the different contests. Probably about 250 or 300 men were on the grounds when the E C cup competition was in progress.

A cause of much disappointment to many of the hungry shooters and visitors was in the matter of lunch, which did not materialize, owing to the negligence or some other cause on the part of the caterer who had been engaged to provide it. This was his second default in the matter, and he would seem to be a good man to drop without further trial. As a consequence, several of the shooters, who had eaten light breakfasts, and some who had eaten none at all, suffered much from hunger. A few sandwiches cropped to the surface, but these were not a small fraction of what was needed.

In a general way, the shoot was not managed in a systematic manner, though Mr. Landis and two or three others devoted their attention to working matters when not shooting. Mr. George Fryer, the club's manager, was an efficient officer in his special department. The cashier's department was in charge of Mr. Starr.

The E C Cup Contest.

After the first three events of the programme were finished, the E C cup contest was next in order. After the traps were adjusted, there was no delay in beginning. Heikes in the toss-up won the choice, and he elected that Fulford should begin.

After the first few birds, both steadied down to a more regular time of shooting, but it was noticeable that Heikes was centering his targets better and catching them quicker, the latter being much to his gain when it came to shooting the doubles. In the latter style of shooting, Heikes caught the first target very quickly

and then had more time to negotiate the second than had Fulford, who was more deliberate on his first, and thereby much of his second-barrel work was at appreciably longer ranges, and consequently he had harder shooting. There were some sympathetic misses in the early part of the race. Of these Heikes missed his 6th and Fulford missed his 7th. Fulford missed his 11th and Heikes followed suit, but when Fulford missed his 12th, Heikes refused to follow. When Heikes missed his 19th, they were on even terms again. Fulford missed his 22d, and Heikes went out one in the lead at the end of the first 25.

In the second 25 Heikes was centering his targets admirably, missing but two, and gaining a lead of two more, so that at the end of the first 50 he was three in the lead; scores then were 45 to 42.

Both were shooting in better form when the expert style was begun. Fulford was doing better at this more difficult style of shooting than at the unknown angles, while Heikes did nearly as well. At the close of the 50 at expert rules Fulford had cut off two off Heikes' lead, breaking 45 to Heikes' 43. Heikes therefore at the end of the 100 was but one in the lead.

The doubles followed last, and in this style of shooting, Heikes pulled away from his competitor after the 10th round had been passed. His quicker shooting of his first target was a decided gain in his favor. This 50 closed with a score of 41 to 36 in Heikes' favor, winning out with a score of 129 to 123.

The race was very interesting from start to finish, and was well contested. Both men exhibited great skill, and there was no hitch from start to finish.

Capt. A. W. Money was referee. Messrs. Edward Banks and J. J. Halliwell acted as judges. Each contestant used a Remington gun and Schultze powder in U. M. C. shells. Heikes used his new Remington, and he seemed to use it as if it were an old acquaintance as a target smasher.

The conditions of the race called for 50 targets at unknown angles, 50 expert rules and 50 doubles, a most thorough and trying test of skill and nerve. Following is the score:

Unknown Angles.	
E D Fulford.....	111111011001111111110111-21

Philadelphia vs. New York.

Later in the afternoon the team race between Philadelphia and Greater New York was begun. There were five men on a side. The conditions were 50 targets each, unknown angles. There was a belief from the start that Philadelphia could pick out a stronger team than New York could. The contest was brought about mainly through the exertions of Mr. Edward Banks, and resulted in a very pleasant and well contested race, or rather a closely contested race, since each team should have done better. Philadelphia should have gone out with a much greater score to its credit, and the New York team had a fine opportunity to pull out a victory out of what seemed a hopelessly lost race. Philadelphia secured a winning lead at the end of the 5th round, missing but 3 to New York's 8. At the end of the 10th round Philadelphia had missed 9, New York 13. At the end of the 15th round New York was still 4 behind, having missed 17 to 13. At the end of the 20th round Philadelphia was one in the lead, the misses then being 18 to 19. The Philadelphia team gained slightly round by round till at the 40th it was 5 in the lead, and was but 2 targets ahead at the end of the 45th, and 3 ahead at the end of the race.

Mr. Jack Fanning refereed the race very ably. Following is the score:

Philadelphia Team.	
Halliwell.....	1111101111011111111111-23
	111100111111111110111111-22-45

Banks and Fanning vs. Heikes and Halliwell.

The postponed race between Fanning and Banks on the one side against Heikes and Halliwell on the other was shot on Jan. 20, on the grounds of the Keystone Shooting League, resulting in a victory for the former. The conditions were 50 targets at unknown angles, 50 expert rules, and 25 pairs. The score was 232 to 224. The results are given in detail as follows:

On Jan. 19 some of the crackerjacks had a practice shoot, the conditions as to styles of shooting being the same as those which govern the E C cup contest. The scores at unknown angles, 50 targets, were: Heikes 43, Halliwell 42, W. H. Wolstencroft 35, Ridge 37, Landis 42, Cartledge 36. Expert rule, 50 targets: Heikes 42, Halliwell 36, W. H. Wolstencroft 36, Ridge 33, Landis 35, Cartledge 41. 25 pairs: Heikes 36, Halliwell 34, Ridge 32, Landis 38, Cartledge 27. Total for the three styles, at 150 targets: Heikes 121, Halliwell 112, Ridge 102, Landis 115, Cartledge 104.

The Reading Handicap.

READING, Pa., Jan. 18.—The Reading handicap, which has been the topic of conversation among the trap-shooters of this part of the State, was held to-day on the Stony Creek shooting grounds. A better day could not have been selected, as the sun shone brightly all day and kept the shooters warm, instead of forcing them indoors after finishing at the score. The grounds, although not completely finished, are fine grounds for live-bird shooting. The entries up to Jan. 17, 10 A. M., contained thirty-one names—seventeen paid entries and fourteen conditional entries. The conditional entries all stated that, owing to "the grip," which has been keeping shooters laid up for a week or so, many could not tell whether they could be present. When the first shooter, Delany, was called to the score at 11 A. M., there was a total entry of seventeen shooters, thus making \$75, \$50, \$25, \$20 to four high guns. The birds were all fresh country birds, and caused the shooters lots of trouble, as they left the traps like a streak when liberated. Kills of high order were features of the day's shooting, especially the first bird of Coleman, and the 15th and 16th birds of Coldren, which were all drivers of the worst kind, and were just hit in time near the boundary line. Fine kills by Delany, Hunter, Wicks, Timmons and Rehrg were all applauded by the large crowd of spectators, which occupied the platform around the shooting house. At one time during the afternoon fully 700 people were present.

The event was under the sole management of Arthur A. Fink, of Reading, who attended to everything, and saw that there were no delays to stop the shooting. The referee was Chas. W. Bechtel, of Reading, who gave entire satisfaction to all present.

Among the sportsmen present from a distance were F. W. Moffett, of New York City; Wm. Apgar and Johnson Warford, of Frenchtown, N. J.; J. C. Timmons, of Morristown, N. J.; Adolph, of Scranton, Pa.; F. W. Cooper (Wicks), Mahanoy City, Pa.; Fred Coleman, of Heggins, Pa.; G. W. Ketner and Geo. Albright, of Oringsburg, Pa.; John H. Gray, of Elizabethtown, Pa.; Geo. S. Trafford, of Lebanon; Elmer Betson, of Frankford, Pa.; Trumbauer, of Royersford; John Rehrg, of Weissport, Pa.; Messrs. Hainly and Spatz, of Sinking Spring; and A. E. Smith, of Keystone Gun Club, of Lebanon.

Among local sportsmen present were Kerr, Jack, Harry Coldren, Lee Wertz, Hunter, Francis Yost, East, Harrison, Schmeck, E. S. Lichtenberger, and others.

The event was won by Coldren, Rehrg and Adolph, who divided the \$75, \$50, \$25, or \$150 between them, with 22 killed; Wicks and Timmons divided fourth money, or \$20, with 21 killed. One of the conditions of the match was: Any shooter dropping three birds was out, and if required could shoot his whole score if he had a chance for the money, after which a miss would be out. Three times the shooters had to come in, as all dropped the required number, and thus it required from 11 A. M. to 3:45 P. M. to shoot the match. The official scores follow:

Hamilton Gun Club.

HAMILTON, Ont., Jan. 21.—The Hamilton Gun Club, which is now the only recognized gun club in Canada, has just concluded a four days' tournament, which has proved the most successful in its career of nine years. Four live-bird events were shot off, \$1,000 being divided among the shooters in these events. In addition, several hundred dollars were divided in target events. The main event, the grand Canadian handicap, at 20 live birds, \$15 entrance, carried \$600 as a guarantee, and was certainly second only to the Grand American Handicap in importance and general interest. This event had fifty-five starters, and was hotly contested from start to finish. Among the prominent gun experts who patronized this tournament may be mentioned H. D. Kirkover, Jr., Fredonia, N. Y.; W. Elliston, Nashville, Tenn.; B. H. Norton, J. H. Cameron, New York; E. C. Burkhardt, R. H. Hibbard, C. E. Hibbard, E. N. McCaskey, Wm. McCarthy, Buffalo; Josh Wayper, Hesperia, Ont.; S. Fairbairn, Minnedosa, Manitoba; W. L. Cameron, Montreal; W. O. Paisner, Nashville, Tenn.; John Parker, Geo. M. Hendrie, W. H. Brady, Detroit; No. 99, Utica, N. Y.; H. Reynolds, Port Hope, Ont.; C. Wilmont, Credit Forks, Ont.; S. Brooks, A. J. Gay, Bowmanville, Ont.; and a large number of local and Canadian shots. Speaking of the tournament generally, the Hamilton Herald winds up a long article with these words:

"The tournament has been conducted in a most satisfactory and pleasant manner. The visiting experts have nothing but words of praise for the management, while the club, on its hand, does not hesitate to pronounce its guests the best lot of genuine sports that has ever visited Hamilton in a similar capacity."

The officers in charge of the tournament, and who were responsible for the success, are President Jas. Crooks, Vice-President Dr. D. T. Baxter, Secretary Harry Graham, Treasurer Dr. J. E. Overholt, Field Captain W. Langhorn, Committeemen Thos. Crooks, Frank Vallance and E. B. Wingate.

The live-bird events were refereed by J. M. Harris. The summaries follow:

Grand Canadian handicap, \$600 guaranteed, surplus added, \$15 entrance, fourteen moneys:

WESTERN TRAPS.

Montgomery Ward Diamond Badge.

CHICAGO, Ill., Jan. 21.—The greatest interest still hangs about the contest for the Montgomery Ward diamond badge. It was a daring experiment to start in on a series of twelve shoots, but this enterprise has been so well carried on, and was conceived on such sportsmanlike lines, that it proved a success not only at the first, but at the last. Yesterday the eleventh contest was held, and it called out eighteen shooters, truly a remarkable showing. This is more than any one club turns out regularly, and it is a practical Cook county live-bird league all by itself, for it brings out the best of the live-bird talent from all the clubs. At this point I may observe that the last shoot for this badge will be held on Friday, Feb. 3, and it will be a gala day. The firm of Montgomery Ward & Co. wish hereby to invite all shooters to be present on this final day. There will be a grand free dinner served at Watson's Park, at which it is hoped every one will be present, and no effort will be spared to make the day pleasant in every particular. The shooting for this last day will begin at 10:30 A. M. Dinner will be at 12 o'clock. The days will then be

IN NEW JERSEY.

At Flemington.

Flemington, N. J., Jan. 20.—About 400 spectators attended the shoot given by John H. Sipler here to-day. Four events were shot; the first at 25 targets, \$15 entry, with a \$20 gold piece offered as a special prize; the second and third at 7 birds, \$5 entry, and the last a miss-and-out. Warford won the \$20 gold piece in the first event with 24 kills, and also shot well throughout. The scores:

Shooting at Yardville.

Yardville, N. J., Jan. 20.—A live-bird shoot was held at Charles Zwirlein's shooting park to-day. Miss-and-out events and two matches made up the programme. The first match was between E. Meyers and Chas. Zwirlein, Jr., aged twelve years, and was won by the youngster. The second match was won by Chas. Huston, who beat John Zwirlein, nine years old, by 2 birds. The scores:

	No. 1.	No. 2.	No. 3.
Page	12121—5	11211—5	2120—3
Reed	12122—5	11110—4	120—2

Trap at Lyndhurst.

Jan. 18.—The match race to-day between T. H. Dunkerly and Charles Lee resulted in a score of 23 to 14 in favor of Dunkerly. Lee drew the hardest birds, but still his score is lower than the luck of the birds would warrant. The conditions were 25 live birds, \$25 a side, loser to pay for the birds.

In the first of two prize matches, at Berry's Creek, they tied on 18. In the second, at Singac, on Bunn's grounds, the score was 21 to 20 in favor of Dunkerly:

T. H. Dunkerly 22122222210222222012222—23
Charles Lee 122202000122222011003—14

A handicap at 10 birds resulted as follows:
Morley, 32 222022222—9 Lee, 28 2222110001—7
Helfrich, 28 12212222—10 Bunn, 26 1*21222—11—8

On Jan. 31 Messrs. Helfrich and Dunkerly will shoot a match on the grounds of the Lyndhurst Shooting Association.

Jeannette Gun Club.

Guttenburg, N. J., Jan. 20.—The regular club shoot of the Jeannette Gun Club was held at the Guttenburg race track to-day. The event was at 10 live birds, handicaps ranging from 25 to 33yds. Hainhorst and Carstens tied for first place in Class A, both having clean scores. In the shoot-off Hainhorst again killed all his birds, while Carstens missed his last, which gave the Class A trophy to the former. Rottman won the Class B trophy for the third time, and it is now his personal property. The scores:

Hainhorst, 28	111111112—10	Foelnenbach, 25	2012201102—7
Carstens, 28	112221112—10	Rinckoff, 30	010*110211—6
Meyer, 28	121101111—9	J. Bohling, 25	10212010*2—6

L. H. SCHORTEMEIER.

ON LONG ISLAND.

Brooklyn Gun Club.

Brooklyn, N. Y., Jan. 21.—The following scores were made at the Brooklyn Gun Club's shoot to-day. The beautiful weather brought out quite a number of shooters. Fourteen events were shot, of which all were singles with the exception of No. 13, which was at 5 pairs. The regular club shoot of the Brooklyn Gun Club takes place on Saturday, Jan. 28. Scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14

Green

Carteret Gun Club.

Jan. 17.—There were five competitors in the regular monthly shoot of the Carteret Gun Club to-day. The conditions were \$50 entrance, 50 live birds each, 30yds. rise and 50yds. boundary. There was a stiff northwest wind, which made the birds fly well. Mr. Robert A. Welch was first with 46, 4 being dead out. Capt. Money was but one behind, and won second. Messrs. Foxhall Keene and Leonard Finletter tied on 41, and C. Ferguson killed 38:

R. A. Welch	221222212**1222212221*2—22	222212222*222222222222—24—46

New Utrecht Gun Club.

Woodlawn, L. I., Jan. 21.—The regular club shoot of the New Utrecht Gun Club was held at Woodlawn Park to-day. A large crowd was present to witness the shooting, and some new faces were seen among the shooters. The shooting, on the whole, was rather poor. Nostrand won the club event with 21 breaks, and Rasch won the Brush gun event with the same score. Gaughen retained possession of the challenge plate by defeating F. A. Thompson by a score of 18 to 14. Live birds will be shot at next Saturday's shoot. Scores:

No. 1, club shoot:	
Nostrand, 5	01111111011101110101011100—21

Phoenixville, Pa., Jan. 19.—The Phoenix Gun Club held the third of a series of club shoots at the club's grounds to-day. Each man shot at 25 targets. Sweepstake events followed. Summary:

Events:	1	2	3	4	5
Targets:	25	10	10	10	20
Holman	16	5	7	6	6
Carrothers	13	5	6	3	10
Erb	12
Hodge	14	6	7	3	11
J. Miller	10
Jenkins	13	4	4
J. Buckwalter	13	4	4
Edwards	...	4	8

Jan. 21.—The last of a series of three shoots between six young and six old members of the Phoenix Gun Club was shot this afternoon in the presence of a large number of spectators, the old members winning by 2 birds, each man shooting at 25 targets, with the final score 75 to 77. Immediately after the close of the match, a challenge was accepted by the young members' team to shoot another series, the first to be shot to-day, which resulted in a walkover for the old members by the score of 98 to 74. Scores follow:

Youngsters—Miller 9, Edwards 9, Whitaker 8, Harple 16, Stevens 13, Capt. Holman 15—75.
Oldies—J. Buckwalter 18, Capt. Erb 7, Dotterer 14, Dunlap 15, Pehlert 10, Hodge 15—77.

First match of second series, same conditions:
Youngsters—Miller 9, Edwards 9, Whitaker 7, Harple 16, Stevens 15, Capt. Holman 18—74.
Oldies—J. Buckwalter 18, Capt. Erb 16, Dotterer 18, Dunlap 15, Pehlert 16, Hodge 15—98.

Sheepshead Bay.

SHEEPSHEAD BAY, N. Y., Jan. 19.—The first monthly shoot of the Sheepshead Bay Rod and Gun Club competition for gold badge, 7 birds per man, was shot at the club grounds at Sheepshead Bay, Jan. 19. Two members tied for first place by downing 6 of their 7 birds each. In the shoot-off Fred Lundy missed on his first bird, a lightning right-quarterer, thereby allowing his nephew to kill his first only in order to take the badge, which he did in good style:

H. Kronika	0002111—4	H. Montanus, Sr.	1220200—4
H. Koch	0100110—3	T. Osborne	0010000—1
J. J. Pillion	2012022—5	I. McKane	2201220—5
F. Lundy	1122210—6	G. Morris	2002012—1
R. Smith	1010111—5	Capt. Baldwin	0010912—2
H. Montanus, Jr.	1111020—5	W. Biddle	2020000—2
D. J. Heffner	0000110—2	J. F. Byrnes	1110000—3
Frank Lundy	1111110—6

Shoot-off for badge:
Fred Lundy 0 Frank Lundy 1
FRANK LUNDY.

Rifle Range and Gallery.

Conlin's Gallery.

MR. JAMES CONLIN will conduct a pistol, revolver and rifle tournament in his gallery at Broadway and Thirty-first street, New York, from Feb. 25 to March 15. It will be called Conlin's Sportsmen's Shooting Contest; and handsome prizes will be given. The term of shooting will include the Sportsmen's Exposition week. The event also will mark Mr. Conlin's thirty-fifth year as a shooting gallery manager.

Yachting.

As the yachting journal of America, the FOREST AND STREAM is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

Yacht Designing.—XXII.

BY W. P. STEPHENS.

(Continued from page 39, Jan. 14.)

The illustrations accompanying this article are copyrighted by the Keuffel & Esser Co., New York, to whom we are indebted for their use.

THE next division of our subject is:

MEASURING INSTRUMENTS.

- For Arbitrary Measurements—
Plain dividers.
Hairspring dividers.
Proportional dividers.
Beam compass.
- For Conventional Measurements—
Measures: Rules and tape lines.
Scales: Plain.
Plotting.
Protractors.

The first class includes the instruments for making arbitrary measurements; as in transferring any distance from one part of a drawing to another. The second class includes the rules and scales for measuring and laying off according to the conventional standards of feet, meters, etc.

Next to an accurate and reliable straight-edge, the plain dividers (Fig. 49) are the most important instrument of the marine draftsman's outfit. They are (the

plural form has an odd sound, and "it is" would seem more natural) in his hands a great part of the time, a single design calls for a thousand different settings; and it is a matter of necessity that the tool shall be as nearly perfect as it can be made. It must be as light in weight as the requisite stiffness will admit, and it must balance easily and naturally in the hand. The joint must open and close smoothly and evenly, not moving by jumps; it must respond to a moderate touch of the fingers, and yet must hold the legs accurately in place in ordinary manipulation, setting off distances, picking up and laying down. The points must be of steel, and properly tempered and ground to the sharpness of a needle. Their office is to make a small but distinct hole, not through the paper, but just in the surface.

The most convenient size for general use is 5in., and the English pattern, with the triangular steel legs rounded to conical points for the last 3/4in. of their length, is the most shapely.

The hairspring dividers (Fig. 50) are similar to the ordinary, but one leg has a spring, instead a hinged joint, with a fine adjusting screw. In this way the points may be adjusted with much greater accuracy than in the ordinary dividers. With the latter, the draftsman should be able to set the two points accurately, by a slight pressure of the fingers of one hand, to two spots pricked in the paper, or to two very fine pencil lines. When it comes, however, to a finer class of work, such as the dividing of a given straight line or the circumference of a circle into

Fig. 49. Fig. 50. Fig. 51. Fig. 52. Fig. 53.

a certain number of equal parts, still greater accuracy is necessary. For such a purpose the hairspring dividers are first set close to the given spots, and any minute adjustment is made by a slight turn of the adjusting screw, moving the lower part of one leg a little to or from the main part.

In use the main joint of the hairspring dividers may be set to work more stiffly than in the plain dividers, so as to be less liable to accidental derangement; a very important point where the same measurement has to be laid off a number of times. In both instruments the plain double-sector joint is to be preferred to the pivot joint, as the latter has of necessity a yoke spanning the two legs, with a central handle. In practice it will be found that the plain head of the double-sector joint is much easier to manipulate than the regular milled handle of the pivot joint.

The spacing dividers (Fig. 51) belong to the bow family, already described, the two legs being forged from spring steel. They are a very convenient tool for laying off small distances, 3 in. and under. In the larger sizes they are apt to be springy and unreliable, unless very well proportioned and made; but within their range they are lighter and more easily handled than the regular hairspring dividers. As in all bow instruments, the thread and nut should be carefully made.

The proportional dividers are made with the joint about the middle of the legs, which cross like an X, and with points at both ends of each leg. In the simplest form, called whole and half dividers, (Fig. 52), a fixed joint is made at one-third the extreme length, so that the two legs on one end are twice the length of those on the other. When the short legs are set to any given distance, the long legs will measure just twice the distance. If they are applied to a design made to the scale of 1in. to the foot, every distance can be taken off with the short legs and laid off anew from the long ones, making a new drawing on a scale of 2in. to the foot. In the same way, if the original distances be taken with the long legs and laid off with the short ones, the scale of the new drawing will be 1/2in. to the foot.

This simple form is naturally of very limited use, but when the joint is made movable, by means of a sliding block and set screw (Fig. 53), the two ends may be altered to any desired proportion. In the most improved form of this instrument, the joint may be secured at any point within a range of two-thirds of the extreme length, the sides of the slot in which it moves being graduated,

either decimally in equal parts, or with certain arbitrary distances, one-third, one-fourth, etc. By means of these marks, or of a special table of ratios, if the division is equal for the whole length, the instrument may be set for a very large number of combinations. It may be so adjusted that when the distance between one pair of points represents the radius of a circle, the distance of the other two represents the side of a square, pentagon, octagon, or other figure inscribed in the circle, or when one pair represents the diameter of a circle, the other represents the circumference in the form of a straight line; or the side of a square of equal area to the circle.

The principal use of this instrument in marine drafting is to translate a given design from one scale to another, either larger or smaller. If, for instance, the original drawing shows a yacht of 40ft. l.w.l. to a scale of 1in. to the foot, the instrument may be so adjusted that the distances taken by it will produce a new drawing of 50ft. l.w.l., enlarged in accurate proportion throughout, to the same scale of 1in., or to any other desired. For work of this kind, which is of very frequent occurrence, it is most useful; but it is a very awkward instrument to use; it is clumsy to handle, difficult to adjust to the spot unless by means of a screw movement, which is slow; and unless very accurately adjusted there is considerable error in enlarging; the amount of error being increased in proportion to the ratio of enlargement.

As a convenient means for measuring and transferring distances, the plain strip of paper with a straight edge deserves mention with the more expensive tools, for many purposes it has practically the accuracy of the dividers, and is even more expeditious. For instance, in taking off heights or half-breadths to be set off on another part of the drawing, a strip of paper may be laid down and the points marked off with a hard pencil; in larger work a light batten of wood is used in the same manner.

The Yacht Racing Association of Long Island Sound.

THE result of the winter work of the executive committee of the Y. R. A. of Long Island Sound in amending and extending the rules is here given. At the general meeting of Nov. 3 the executive committee was instructed to draw up limitations, covering different points, and the work was recently approved and accepted at a general meeting:

Measurement.

1. Yachts of the 36ft. class and all larger classes shall be rated by racing measurement, which shall be determined by adding together the load waterline length, the beam, .75 of the girth and .5 of the square root of the sail area, and dividing the sum by 2.

$$\frac{L.W.L. + B. + .75 G. + .5 \sqrt{S. A.}}{2} = R. M.$$

2. The load waterline length shall be the distance in a straight line between the points furthest forward and furthest aft, where the hull, exclusive of the rudder stock, is intersected by the surface of the water, when the yacht is afloat in racing trim, in smooth water, with any person or persons who may be aboard when the measurement is being taken stationed amidships.

If any part of the stem, sternpost or other part of the yacht below the load waterline projects beyond the length thus measured, such projection shall be added to the measured length; and a form, resulting from the cutting away of the fair line of the stem, sternpost or the ridge of the counter, for the apparent purpose of shortening the load waterline, shall be measured between fair lines.

The measurement for load waterline length shall be made with the same number of persons on board as are allowed for crew in the yacht's class, whose average weight shall not be less than 150lbs.; or, at the option of the measurer, with a dead weight equivalent thereto.

The measurer at the time of taking his measurements shall affix a metal plate as a distinctive, permanent mark at each end of the load waterline.

3. The beam shall be taken from outside to outside of the planking on the broadest part of the yacht, and no allowance should be made for wales, double planks or moldings of any kind.

4. The girth shall be taken from load waterline to load waterline under the keel at a point 0.6 of the distance between the outer edges of the length marks from the fore end. The girth shall be measured along the actual outline of the vertical cross-section at that point at right angles to the load waterline. If the draft forward of that point exceeds the draft at that point, twice such excess shall be added to the girth. In taking these measurements all hollows on the fore and aft under water profile of the yacht to be treated as filled up straight.

To the girth of centerboard yachts must be added twice the distance between the lower side of the keel to the center of the area of the centerboard when lowered to its full extent. Centerboards when ballasted, except to overcome flotation, fitted with bulbs or otherwise, to be measured as fixed keels.

Measurers shall mark the points for measuring the girth as follows: By fixing three metal plates of suitable size on each side of the yacht not less than 2in. or more than 6in. above the load waterline level, and parallel thereto, and not less than 3ft., or more than 6ft., from end to end, and so that the center mark of the three coincides with the distance 0.6 from the fore edges of the length marks at bow. The measurer shall also place a plate coinciding with this center mark under the rail or covering board, and another on the side of the keel perpendicular to the load waterline level. The distance between the load waterline level and the horizontal marks to be measured when the yacht is afloat in smooth water, and deducted from the girth as obtained from center mark to center mark.

Measurers may accept for the measurement of girth the designer's written certificate or drawing, certified to as being correct by designer and builder. But this shall not relieve the owner from fixing the marks heretofore described, or relieve him from the responsibility of the accuracy of the certificate and proper position of the marks. In the event of a measurement protest the yacht must be measured as heretofore provided.

5. The sail area shall be ascertained by taking a perpendicular along the after side of the mainmast from the under side of the sheave of the highest halyard block or sheave on the topmast, to the upper side of the boom when resting on the saddle or on the lowest part of the gooseneck, the distance of which point from the main deck or house deck shall be recorded by the measurer, as well as the other points used in measurement.

The forward point of measurement of the base line shall be midway between the intersection of the bowsprit and jib topsail stay, and the center of the tack cringle of the jib or flying jib when set. The after point of measurement shall be the outer end of the main boom in schooners, cutters, sloops and catboats, and of the mizzen boom in yawls.

The main topmast shall be measured from the hounds of the lower mast to the under side of the sheave of the highest halyard block or sheave on the topmast; 80 per cent. of this length shall be deducted from the extreme length of the main gaff, measured from the inside of the jaws to the outer end, and the remainder shall be added to the base line.

In all cases where the length of the spinnaker boom exceeds the distance from the forward side of the forward mast to the forward point of measurement, such excess shall be added to the base line. The length to be taken for the spinnaker boom shall be the extreme distance of its outer end from the center of the fore side of the mast on which it is carried, measured when the boom is in place for use.

In pole-masted yachts and those not carrying topmasts, the distance between the under side of the sheave in the throat-halyard block and the under side of the sheave in the uppermost halyard block or sheave on the mast shall be used for determining the length of the base line in the same way as is the topmast when one is carried.

In yachts which do not carry headsail, the forward point of measurement for the base line shall be the after side of the mast, or of the foremast, if there is more than one mast.

The sail area from these figures is obtained by multiplying the corrected base by the perpendicular, and dividing by two.

Where in any case, owing to peculiarity of rig, the sail area of a yacht cannot in the opinion of the measurer be fairly measured in the customary way, he may, with the sanction of the race committee, take such measurements as will enable him to compute the actual area of sail carried, or that may be carried on the spars used.

The prescribed method of measuring shall, however, be adhered to in all cases where practicable, and where the leach of a sail is extended beyond a straight line, or where as in a lug mainsail the luff extends forward of the mast or the head is rounded, the increased area resulting shall be added to that obtained by the customary measurement.

6. Any yacht the racing measurement of which, thus ascertained, exceeds the maximum limit of the class in which she raced prior to Dec. 1, 1898, shall be allowed to race in such class, but shall allow time on the basis of her new racing measurement.

7. Yachts of the 30ft. class and all smaller classes shall be rated for classification and time allowance by racing measurement, which shall be determined by adding to the load waterline the square root of the sail area and dividing the sum by 2.

$$\frac{L.W.L. + \sqrt{S. A.}}{2} = R. M.$$

8. The racing measurement of a yacht launched after Dec. 1, 1898, shall be assumed to be the maximum limit of her class. Any yacht the measurement of which has been increased, by changes in dimensions, to such extent as to place her in a class above that in which she raced prior to that date, shall assume the maximum length of that class.

9. If a yacht, after having been officially measured, be increased in any dimension that is a factor in determining her racing measurement, the yacht must be remeasured before starting in a race.

10. If through protest the measurement of a yacht be called in question, the race committee shall direct the measurer to remeasure such yacht, and the result as reported by him shall be final. The usual fee for measuring shall be collected from the owner if the measurement be found to exceed the measurement filed, and from the person protesting if not.

The owner of a yacht so protested shall present his yacht for measurement immediately after the race, when so required by the race committee.

11. A yacht whose official racing measurement has not been filed with the race committee prior to the start of a race shall not be eligible to compete.

12. The weight of ballast of yachts launched after Dec. 1, 1898, shall not exceed 0.6 of the displacement.

Classification.

1. All yachts shall be classified by racing measurement, and shall be divided into classes as follows:

Schooners.

1st Class—All over 100ft.
100ft. Class—Not over 100ft., and over 80ft.
80ft. Class—Not over 80ft., and over 65ft.
65ft. Class—Not over 65ft.

Sloops, Cutters and Yawls.

1st Class—All over 65ft.
65ft. Class—Not over 65ft., and over 52ft.
52ft. Class—Not over 52ft., and over 43ft.
43ft. Class—Not over 43ft., and over 36ft.
36ft. Class—Not over 36ft., and over 30ft.
30ft. Class—Not over 30ft., and over 25ft.
25ft. Class—Not over 25ft., and over 21ft.
21ft. Class—Not over 21ft., and over 18ft.
18ft. Class—Not over 18ft.

Catboats.

30ft. Class—Not over 30ft., and over 25ft.
25ft. Class—Not over 25ft., and over 21ft.
21ft. Class—Not over 21ft., and over 18ft.
18ft. Class—Not over 18ft.

Knockabouts.

25ft. load waterline Class.

21ft. load waterline Class.

2. The knockabout classes shall include only such yachts as have been, or shall be, built in accordance with the definitions and restrictions appended.

3. All yachts of 30ft. racing measurement and under shall be separated into two divisions, to be known respectively as the cruising division and the racing division.

The cruising division shall include all knockabout yachts; also all cabin sloops, cutters and yawls of the 30ft. and 25ft. classes, all open sloops of the 21ft. and 18ft. classes, all cabin catboats of the 30ft. and 25ft. classes, and all open catboats of the 21ft. and 18ft. classes, the construction of which is in accordance with the table of scantlings appended. But any yacht in existence Dec. 1, 1898, that is of substantial construction, conforming practically to the table of scantlings, shall be considered as in the cruising division.

The racing division shall include all other yachts of 30ft. racing measurement and under.

Definition of a Cabin Yacht.

A cabin yacht is intended to be a seaworthy type of cruising and racing yacht, substantially constructed, properly ballasted and with moderate sail plan, either a flush deck or with cabin trunk on deck, having suitable cabin accommodations below, and conforming to the limitations herein mentioned.

Headroom.

The minimum headroom in the clear, under deck or cabin trunk beams, over the entire required cabin floor, exclusive of skylights and hatches, shall be as follows:

Class	25ft.	30ft.	36ft.
Headroom	3ft. 9in.	4ft. 6in.	5ft. 6in.

Cabin Trunk.

The height of cabin trunk when used, measured from the level of under side of planksheer to the under side of cabin trunk, shall not exceed 2in. for every foot of greatest beam.

Cabin Floor.

The cabin shall have a floor between frames amidships in width not less than one-quarter the greatest beam, and in length not less than the following:

Class	25ft.	30ft.	36ft.
Cabin floor, length	7ft.	10ft.	14ft.

Fixtures.

There shall be a substantial partition at the after end of cabin, and two permanent lockers, and suitable fixed berths or transoms for the accommodation of the crew.

Fittings.

The cabin shall contain cushions or mattresses for the berths or transoms; one blanket for each berth or for each length of 7ft. of transom; stove, cooking utensils, and a receptacle for two gallons of water.

Yachts shall carry anchors of the following weight:

Class	25ft.	30ft.	36ft.
Weight	30lb.	40lb.	55lb.

and cable of the following dimensions:

Class	25ft.	30ft.	36ft.
Length	100ft. 1½in.	130ft. 2in.	150ft. 2½in.

Yachts shall also carry life preservers, compass, riding light, fog horn, bucket, and boat hook.

All fittings and fixtures herein mentioned shall be suitable for cruising purposes, and shall not be removed, or substituted by articles smaller, or of lighter weight.

Ballast.

All ballast must be below the floor of cabin or cockpit.

Alterations.

Alterations made on existing yachts must conform to these limitations.

Definitions and Restrictions of Racing Knockabout Classes.

Definition.

A boat of this type is intended to be a seaworthy boat, with cabin house and fair accommodations; with watertight standing room or air tanks of sufficient capacity to float the boat when full of water; rigged simply with only mainsail, forestaysail or jib, and spinnaker.

Classes.

There are to be two classes, one of 25ft. l.w.l. and one of 21ft. l.w.l. The waterline shall be measured with full equipment and crew on board.

Beam.

The beam at L.W.L. shall not be less than specified in table.

Freeboard.

Freeboard shall not be less than specified, except that a reduction of 1in. will be allowed for every increase of 1ft. in beam.

Centerboard.

Centerboard, when used, shall be of wood, and must not be weighted more heavily than is necessary to sink it readily.

Cabin Floor.

The cabin shall have a floor between frames amidships in width not less than one-quarter the greatest beam, and in length not less than specified.

Headroom.

The minimum headroom over the required floor space in the clear shall be not less than specified.

Fixtures.

There shall be a partition of the thickness specified at the after end of cabin, which shall be fitted with two permanent lockers.

Draft.

The draft shall be within the limits specified.

Ballast.

The total outside fixed ballast shall not be less than specified for the required beam. A proportional reduction of ballast shall be allowed for each inch increase in beam. Certificate of weight of ballast shall be furnished the measurer by designer and builder.

Scantling, Planking and Construction.

The keel, stem, frame, house and deck beams shall be of oak or its equivalent in strength. Deck clamps shall

run from stem to stern, with the minimum cross-section as specified for at least one-half; also bilge stringers shall run for at least one-half of the extreme length of the boat amidships. Clamps and stringers to be of yellow pine or its equivalent in strength.

Sails.

The sail area shall be not more than that specified, and not over 80 per cent. of the area shall be in the mainsail. The measurer shall be provided with the correct sail plan of any boat to be measured, and previous to measurement the owner shall cause distinguishing marks, satisfactory to the measurer, to be placed on the spars as follows: On the mast at the tack at the foot of mainsail; on the boom at the clew of the mainsail; on the gaff at the peak of the mainsail. No part of the mainsail shall extend beyond these marks. The marks shall be black bands painted around the spars in a manner satisfactory to the measurer; the inner edges of the bands shall be the limits of the sail. The area of the jib shall be considered to be 80 per cent. of the area of the forward triangle, viz.: The product of one-half the distance from the point of attachment of the tack to the stem or bowsprit to the forward side of the mast, multiplied by the distance from the deck at fore side of the mast to the intersection of the mast and jibstay. The extreme distance from mast to end of spinnaker boom when in position as used shall not be more than the quotient arising from the division of a constant by distance from deck to throat of spinnaker halyard block, figured in feet and decimals. The constants shall be: for the 25ft. class, 675; for the 21ft. class, 400.

Equipment.

To include anchor and cable as specified, bucket, pump, compass, fog horn, boat hook, lead and line, lantern and live preservers.

Crew.

The total number of persons on board shall not exceed that specified. The helmsman shall be an amateur, and not more than one paid hand shall be carried.

All boats launched previous to the adoption of these rules that have been accepted by the Knockabout Association under previous rules shall be admitted to the classes.

TABLE OF RESTRICTIONS.

	Classes.	
Length on L. W. L., maximum.	21ft.	25ft.
Beam at L. W. L., minimum.	7ft.	8ft. 6in.
Freeboard, minimum.	20in.	24in.
Length of cabin floor, minimum.	7ft.	10ft.
Partition at after end of cabin, minimum.	5in.	4in.
Headroom, minimum.	4ft. 9in.	5ft.
Ballast, minimum.	3,500lbs.	6,000lbs.
Reduction of ballast for each inch increase of beam.	60lbs.	95lbs.
Area of frames, minimum.	1in.	25sq.in.
Area of deck beams, minimum.	1 1/2 in.	2 1/2 in.
Area of house beams, minimum.	3/4 in.	2in.
Spacing of frame, deck and house beams, minimum.	9in.	12in.
Thickness of planking, deck and sides of house, min.	3/4 in.	7/8 in.
Thickness of top of house, minimum.	5/8 in.	3/4 in.
Cross section of deck clamps, minimum.	4in.	5in.
Cross section of bilge stringers, minimum.	4in.	5in.
Sail area, maximum.	600sq. ft.	1,000sq. ft.
Draft, maximum.	5ft.	6ft.
Crew, maximum.	3	4
Weight of anchor, minimum.	25lbs.	40lbs.
Length of cable, minimum.	100ft.	130ft.
Size of cable, minimum.	1 1/4 in.	1 1/2 in.

Construction—Cruising Division.

TABLE OF SCANTLINGS.

	Cal in.			Open.	
Classes.	20ft.	30ft.	25ft.	2. ft.	18ft.
A—Stem, sided at head.	1in.	1in.	1in.	1in.	1in.
B—Sternpost, sided at tuck.	4 1/4	3 1/2	3 1/4	2 1/2	1 3/4
C—Keel and keelson, sectional area.	50	60	80	10	5
D—Frames, sectional area:					
Heel.	4 1/4	3 1/2	2 3/4	1 1/4	1
Bilge.	4	3	2 1/4	1 1/4	1
Heads.	2 1/2	2	1 1/4	1 1/4	1
Maximum spacing.	12	11	10	9	8
E—Floors, wood, sectional area.	9	7	5	5	4
Equivalent steel L.	3x2x1/4	2x2x1/4	2x2x1/4	2x2x1/4	2x2x1/4
Maximum spacing.	24	22	20	20	18
F—Shelf or clamp, sectional area:					
Middle.	8	6	4 1/2	2	1 1/2
Ends.	5 1/2	4	3	1 1/2	1
G—Bilge stringer, sectional area:					
Middle.	6	4 1/2	3	1 1/2	1
Ends.	4	3	2	1	1
H—Deck beam, sectional area:					
Main.	0 1/2	5/8	4 1/2	2	1 1/4
Auxiliary and half-beams.	4 1/4	3 1/2	2 1/2	1 1/4	1
Maximum spacing.	12	11	10	9	8
I—Planking, to finish full.	1 1/4	1	3/4	5/8	1/2
Hood ends above waterline.	1	3/4	3/4	1/2	1/2
J—Deck, to finish full.	1 1/4	1	3/4	5/8	1/2
K—Keel bolts, spaced 12in.	1	3/4	3/4	1/2	1/2
L—Metal centerplate, maximum thickness.	3/4	3/4	3/8	1/2	3/8

* If deck is canvas covered a reduction of 1/8 in. allowed.

General Specifications and Explanation of Table.

Those portions in italics are compulsory; the others are only suggested.

The sizes in the accompanying table are based upon the assumption that the construction, as a whole, is planned by a competent naval architect, with the usual complement of minor members not specifically called for in the table; that the yacht is built under cover; and that the materials and workmanship are what is commonly called "first-class"—namely, all wood sound, well seasoned, and free from loose knots, shakes and sap, all knees and crooks being cut with the grain; all metal work properly wrought and neatly finished; all parts carefully fitted, with adjoining surfaces in actual contact throughout the full area; and all fastenings carefully selected with regard to their relative strength, and the sizes and material of the parts they are intended to unite, and that they are properly located and driven.

A—Stem.—The minimum siding (thickness) measured at the rabbet at highest point on stemhead, no decrease of siding allowed.

Apron.—In some cases an apron is necessary inside of stem, with breasthook, and in the larger classes with knightheads.

B—Sternpost.—Minimum siding at truck (the crossing of the rabbet). The siding may diminish from tuck to heel. The rudder stock, if of wood, to be equal in diameter to the siding of post.

C—Keel.—With the usual iron or lead keel and good floor construction, there is no necessity for a great depth of main (wood) keel to secure vertical strength. The minimum of sectional area (breadth multiplied by depth in the middle of keel) may be made up, if desired, by a deeper keel, or may include the keelson, or bedpieces of centerboard trunk.

Keelson.—In keel yachts of moderate depth a keelson is not absolutely necessary, and the required strength may sometimes be obtained to better advantage by the floor construction alone. A keelson may be worked to advantage over the throats of the floors in some cases, the centerline bolts of metal keel passing through it. In centerboard yachts, especially in the absence of a deep metal outside keel, side keelsons should be worked over the heels of floors, or the bedpieces of the trunk should be of ample scantling and worked well fore and aft of the slot, to serve as keelsons. No absolute sizes of keelson are laid down.

D—Frames.—The many different methods of framing now in use, and the possibility of new methods in the future, make it impossible to prescribe exact dimensions or spacing. Both sizes and spacing necessarily differ with the various methods of all sawn frames, in futtocks and tops, doubled; of single sawn frames from knees, in single lengths; of all bent frames of uniform size; and of combinations of sawn and bent frames.

The sizes laid down in the table show the minimum sectional area of frames (the siding multiplied by the moulding) at three points—the heel of frame where it is boxed into the keel, the middle of the frame about the flat of the floor and turn of bilge, and the head at plank-sheer. The sectional area is that of a single frame for a uniform spacing of 1ft. in each class. This required area may be made up of smaller frames spaced closer together, or larger frames further apart; or of combinations of large and small frames with appropriate spacings. This minimum sectional area shall apply to a space of at least two-thirds of the L.W.L. length in the center of the vessel; forward and aft of this, the sectional area may be reduced 20 per cent. Two adjoining frames abreast each mast and one at each runnerplate should be increased in size in proportion as they are cut by the chainplate fastenings.

Where bent frames are used in combination with sawn, the bent frames may be of uniform scantling from end to end; but the sawn frames must be large enough to make up the required average sectional area at the heels where they are cut by the fastenings of floors.

Where all bent frames are used, of uniform size from heel to head, this size shall be no less than assigned in the table for the bilge.

Spacing of Frames.—The maximum spacing of frames, as given in the table, is based not on the size of frames, this being variable, but on the thickness of planking allowed for the class; being the greatest spacing that will insure a tight seam with the usual caulking for the minimum thickness of planking allowed.

E—Floors.—The many varieties of floor construction make it difficult to establish any standard; but there should be at least six strong floors in the center of the vessel in way of the metal keel, and two at each mast step. The table gives the minimum sectional area over centerline of keel, of wood floor knees, and the equivalent sizes of steel angles, with approximate spacing. The size of floors may be reduced in proportion if the spacing be reduced. In place of wood floors, metal straps or angles of equivalent strength may be used. The arms of the main floor should run up to a length at least equal to the spacing given in the table, to allow space for fastening through heels of frames. In yachts of S section with all bent frames, the arms of floors should run up at least to the height of the waterline. Provided that the main floors are of ample strength, the floors on the smaller frames in the middle of the vessel and on all frames in the ends may be of flat iron or straight-grained plank. All floors should be thoroughly bolted to the keel, stem and horn timbers. It is not essential that the main keel bolts should pass through the floors, as the large size of the holes weakens the knees unnecessarily. The keel bolts may set up on top of the wood keel, in which case the floors should be very thoroughly fastened by smaller bolts to the wood keel; or a keelson may be worked over the throats of the floors, and the keel bolts may set up on it.

F—Shelf or Clamp.—The minimum sectional area given for the middle shall cover a length of at least one-half of the shelf (or clamp) and in the middle, a taper being allowed to the size given at each end. The ends of deck beams may be jogged into top of shelf a distance not exceeding one-third of their own depth. If a beam clamp is used, fitted close up to the planksheer, the beams being

thus jogged in for their full depth, the sectional area shall be increased in proportion.

G—Bilge Stringer.—The minimum sectional area at middle shall cover at least one-half the full length of bilge stringer, with taper allowed at the ends. At least one bilge stringer must be run on each side, at about the lower part of turn of bilge, and two are recommended in any case, the sectional area of each being at least one-half of that of the single stringer. In yachts whose extreme beam exceeds twice the greatest depth from under side of deck to upper side of keel, two such stringers on each side should always be fitted.

H—Deck Beams.—The minimum sectional area of deck beams shall cover at least the middle third of the beam, allowing a taper, in the moulding, to each end. There must be one main beam at the bitts, two at each mast (partner beams), one at fore end of cabin trunk, one at after end, two at each skylight, hatch and companion in flush-decked vessels, and one at transom. The auxiliary beams may be of the smaller area given. The beams may be spaced at will, provided the maximum distance between centers does not exceed that given in the table, which is based upon the thickness of deck planking. The beams should be jogged into the shelf or clamp a distance equal to one-third of the moulded depth of beam at ends.

I—Planking.—The dimensions given in the table are the minimum thicknesses allowed, after final planing, over a distance in the middle of the vessel equal to at least one-half of the over all length. It is not compulsory that the garboards be of greater thickness than the rest of the planking, but this is sometimes desirable, especially in the larger yachts.

The rabbet from the waterline upward on the stem, and along the horn timbers, may be cut to the depths given in the table, the hood ends of the planks being slightly tapered to this reduced depth.

It is recommended that wherever practicable the planking shall be in single lengths, without butt; and that where butts are unavoidable they should be made, not on the frames, but on butt-blocks between the frames. Butts in adjoining strakes should be at least 6ft. apart, and butts in the same space should be separated by at least three intervening strakes. The planking should be worked in narrow widths, especially in the topsides.

J—Decking.—The thickness given for the deck plank applies also to the planksheer (covering board) and the partner planks. The ends of the deck plank should be well supported, and in no case should they be wrought to a shim edge, which will crush down in caulking.

K—Keel Bolts.—The sizes given are the minimum diameters for the main (center line) keel bolts when spaced 12in. apart. The sizes and spacing may be varied as long as the equivalent strength is maintained. These sizes are sufficient for the average metal keel, of about 50 per cent. of the total displacement; but if the keel be deep and narrow it is recommended that the side bolts, of smaller size, driven diagonally from each side in alternation, be used in addition in the spaces between the main bolts. Where considerably less than 50 per cent. of the total displacement is carried in the metal keel, all bolts may be reduced in proportion. For yachts to be used only in fresh water, steel bolts may be used, without galvanizing, both with lead and iron keels.

It is recommended that the outside metal keel, whether of lead or iron, be cast before the wood keel is worked out; the contraction of the iron or lead is more or less an unknown quantity, and the keel, when finally cast, may not be of the exact dimensions intended, and may not fit the wood keel as worked from the plans.

L—Metal Centerplates.—Solid plate centerplates not exceeding the thickness given in the table shall be allowed. In built up metal plates and wooden boards weighted with metal, the total weight shall not exceed that of a solid steel plate of the same superficial area and of the thickness allowed by the table.

General Details.—It is recommended that diagonal straps of steel be worked across the deck frame in way of masts and runners, being scored into the beams; and that similar straps be worked across the main frames, two at the main chainplates on each side and one at the runner plate. The deck frame should be specially strengthened about the bitts and masts, and ample pro-

JENNY WREN, KNOCKABOUT.

vision should be made for the pull of the halyards on the bitts, blocks and hooks around the mast. For this purpose bolts may be run from deck to keel, or iron braces may be fitted below deck, well bolted to the mast. At least three hanging knees should be worked on each side, and in the larger yachts there should be hanging knees on the main beams at bitts, partners, middle and after end of house and transom. Lodging knees should also be worked about the partners and at either end of house.

The shelf or clamp may be reinforced by fore and aft pieces abreast of the channels, worked inside the shelf and up under the deck beams and covering at least six frame spaces. Similar pieces may also be worked lower down, to take the lower bolts of the main chainplates.

The America Cup.

AN attempt was made on Jan. 21 to cast the lead keel for the new Morgan yacht, but it was unsuccessful, and the work was stopped after some lead had been run into the mould. The reports are that one of the two melting pots cracked, and again that the pots were located so far from the mould that the lead cooled in the leaders. The following is from the Boston Globe of Jan. 21:

Extended experiments have been made at the Herreshoff Works with a view to testing the value and practicability of what may be called a "knuckle joint" plating, but all indications are that this method has not been adopted, but that the usual form of "in-and-out" plating will be used, with a possible modification based on the experiments made for the first-named method.

A "knuckle joint" plating would mean one in which the edges of the plates would be flanged inward, and then riveted together by the flanges, instead of having the riveting done in the overlap of the plates, as in the customary form of "in-and-out" plating. The advantages would be a smooth outside surface, in which all possible resistance from the edges of the plates in the ordinary style would be done away with. A little seam would show where the flanges turn inward, but that would be filled with cement, so as to make the entire surface of the body uniform in smoothness.

At the same time the flanges would strengthen and stiffen the plates and permit the use of thinner ones than by the usual form of lap.

The method has disadvantages as well as advantages. To flange all the plates on both edges and make a smooth joint would be a long, tedious and expensive job, entailing probably a new block for bending each plate and extremely careful fitting and riveting. Cost would not, of course, be considered, but time is a factor, and the boat is to be launched by the first of June.

A practical modification of the "knuckle joint" plan would be the use of "in-and-out" plating, but with the "in" plates flanged as for the other style. This would give practically the same stiffness to the plating and allow the use of as thin plates, while at the same time allowing the usual way of fitting and riveting. The outside surface would be no smoother than shown in the "in-and-out" plating of Defender, but this is not so much of a disadvantage as to make the "knuckle joint" very much superior.

The plating of Defender is so tapered in width from amidships to the ends as to have the seams follow very closely the diagonals of the boat. It is along these diagonals, according to the accepted theory, that the water flows as the boat forces her way through it, and therefore in making the plating correspond the friction is reduced to a minimum.

The modification as also experimented with is believed to be the one most likely to be shown if any flanging is done.

Either style would necessitate the cutting of the flanges at every frame, or every 20in., and while this weakening of the flange could be obviated by turning a flat plate around each frame and riveting it to each end of the cut flange, yet the process would be a long one. Still, it is believed that it would be possible to do the work by the modification as outlined before June 1.

Defender's frames were of steel. Most of them were 15-16in. on the flange, or the portion of the angle to which the plating is riveted, and 2½in. on the web, or portion projecting into the boat. Some of the frames amidships were 1½ by 2½in., but all of them showed a ½in. bulb on the web, greatly increasing their strength.

The steel frames for the new boats are in varying sizes, as if greater differences were to be made between those amidships and those fore and aft than shown in Defender, but all show the same bulb and general characteristics.

Another consignment of these steel bulbed angles for the new boat arrived to-day, and are from the rolling mills at Phenixville, Pa., as were the angles that arrived last week. There are sixty-eight of the angles in this lot, and most of them are about 30ft. in length and about 3in. in width, the shorter angles being about 2in. in width and about 10 to 12ft. in length. This makes a total of exactly 186 bulbed angles that have arrived here from Phenixville.

The Seawanhaka Cup.

THE following has been sent out from Montreal, following the visit of Mr. John Hyslop last week:

The details for the next international races for the Seawanhaka cup, between the Royal St. Lawrence Y. C. and the Seawanhaka Club have been arranged amicably, but they will not be made public till both clubs have signed them. Although it took a long time for the negotiations to be completed, this was due more to the difficulty on the part of both clubs to get committees together to discuss the affairs than to any squabbling about the details. There has been some very voluminous correspondence, when finally the Seawanhaka Club announced that they would send one of their members to discuss the matter with the gentlemen in charge of the affairs in Montreal. Yesterday Mr. Hyslop, who for years has been the official measurer of the Seawanhaka Club, came here and spent the day in close conference with Mr. Duggan and the other gentlemen interested. The meeting was of the most amicable kind. Both sides were ready to make all possible concessions, and Mr. Hyslop went away with the

draft of the conditions in his pocket, leaving behind him the assurance that they would doubtless be accepted in New York. The three most novel and most important points are in regard to the time for holding the races, the form of the boats and their measurements. It was well understood last year when negotiations were opened again for another series of races between the clubs that the form question would be among the principal ones to be decided, so as to prevent any questions being raised at the time of the races, as was done in the case of the Dominion. Therefore certain restrictions have been placed upon the form of the boats. Restrictions have also been placed upon the length over all, but the question of solidity has been left in abeyance. The date, however, has been changed on account of the Canada's cup races, which will take place in August in Toronto, between the Chicago Y. C. and the Royal Canadian Y. C. The date has not yet been definitely settled, but it is expected that the races here will take place about the middle of July.

Jenny Wren, Knockabout.

WE are indebted to Mr. W. B. Stearns, of Marblehead, for the accompanying photo, taken by Mr. Willard Jackson. The yacht is the handicap knockabout Jenny Wren, owned by Mr. F. E. Peabody. There was at the time a good sailing breeze and short sea, the single wave shown being but one of a series.

Canoeing.

All's Well that Ends Well.

I.

It was all Vic's fault. There's no doubt about that. If I start on a cruise or a picnic, I never leave anything behind; well, that is, hardly ever.

It was all very well for Vic to say that it was as much my picnic as his, and that I, being older and more experienced, should have looked all round, and should have seen that everything was on board. I'm too old a bird to take the blame when there is a decent excuse for shuffling it off on some one else, and it was Vic's boat and his picnic; we didn't care whether we went or stayed, though we all thought it would be just the thing to give the Mater a nice quiet day at home without a lot of meals to get. The Mater appreciated our thoughtfulness, and packed up an ample lunch and tea for the five of us, taking careful account of the Stony Lake appetites we were all known to possess.

It was a hot day, a genuine inland July scorcher, and the frogs basking in the sun at the boat house landing sizzled and hissed when our approach made them jump in alarm into the cool depths beneath the lily pads and rushes. On such a day a straw hat with a 3ft. brim is the finest boating cap ever invented, and when you get a crew of five strung from end to end of an 18ft. partly decked skiff, you might almost take her for a straw stack gone adrift in a March flood.

I cannot tell, dear reader, whether you know much about Stony Lake or not. I do. It has some hundreds of islands and about as many rocks. I know there are rocks, because I had several opportunities of becoming intimately acquainted with some of them, being, so to speak, thrown into their company quite unexpectedly, which is often a very good way indeed of becoming well acquainted with either persons or things.

It was because I knew all about the rocks and islands that I was asked to sit forward on the lookout, where it was only possible to have a young lady on one side of me, while Vic, being at the tiller, had one next him to port and another to starboard. The above is the reason Vic gave, but I'm still in doubt myself; yet it may be so.

Well, as I said before, I was to act as pilot, and under my guidance we got away about 10 A. M. with a moderate southeasterly breeze, our general course being about east by north. I say advisedly general, for the many islands introduced various kinks in our course, and also various kinks in the direction of the wind, which necessarily reacted to make the boat's course still more erratic.

Let me explain briefly the general features of Stony Lake. Imagine a miniature Muskoka minus the burnt pines, or a reduced copy of the Thousand Islands minus the fashion and expensive tourist resorts, and you have Stony Lake, a grand place to wear old clothes and to enjoy outdoor life to the full. About twelve miles long altogether, it may be roughly divided as follows: Four miles at the southwest end practically free from islands, and appropriately called Clear Lake; then an archipelago of islands, followed by a more or less clear stretch, brings us to Boschink Narrows, some eight miles from Young's Point, at the southwest end of the lake; thence it is about four miles as the crow flies to the easterly end of the lake. At Boschink the lake is only about half a mile wide, and as it is thickly set with islands at this point, the boat channels are very narrow. At no point is the lake more than two miles wide, so what with rocks and islands the navigation is often somewhat intricate. North of the eastern end of Clear Lake an arm thickly studded with islands runs westerly some two miles to Burleigh Falls.

We were at Boschink, and Jack's Creek at the far eastern end of the lake was the point to which I was expected to pilot the party. I had, so far, only been as far east as Eels Creek, about half-way there, but my little chart would do the rest.

Now the islands about us at the start were very pretty, I'll freely admit, but just then they came in for more left-handed blessings than artistic appreciation. An opening appears between two islands, and rushing through it comes a vagrant zephyr, filling our sail, and gently waving our hat brims till we resemble more a row of huge yellow cabbage butterflies sitting on a log than sensible human beings off on an outing. Then a high bluff on the next island interposes, and we crawl slowly along till a wandering air, stealing down a narrow cleft, takes us almost dead ahead, and Vic lets the boat fall off to keep her full.

So we run on till, looking under the sail, I see big brown rocks just under our lee. "Put her about, Vic, quick!" I cry, and down goes the helm. But will she go about? Not a bit of it. The more the boat comes up the

more the wind frees till Vic finds that, if he goes about he will be pointing for home again.

However, the free wind suits us exactly, and away we bowl till a fresh island becalms the boat once more.

I said it was hot when we started, but it was hotter now. No man dared move from his seat, for unless he sat down again with the utmost accuracy on the same spot, he might as well have sat upon a red hot stove. A row of blackbirds sat upon a dead limb near by, with beaks open and wings hung out to cool. The rocks and trees upon the islands wavered and quivered like a landscape seen through a running brook, and a smell of heated pine and cedar floated over the water to our noses.

But the worst of our trouble was over when once we drew out into the more open waters of the eastern end of the lake, where the islands seem to hug the southern shore.

Here the breeze got a fair sweep at us, and we raced along at a glorious gait, quite happy and care free till certain black dots and breaking wave crests warned us the course was set with numerous rocks.

"Keep her away, Vic. Keep her away," and a block of granite swept by to starboard.

"Luff her, quick!" and a brown swirl showed where a hidden rock flashed by to port.

So we zigzagged our way down the lake, watching carefully each breaking wave lest it meant a reef, and keeping clear of all low lying points lest they ran on beneath the water's surface.

By and by we ran into the streaming weeds at the lake's end and dropped our canvas.

No creek could be seen. Where was it? A gentle roar struck my ears and I said: "There's the creek," and pointed where a slight indentation showed itself a few hundred yards to the west. With a sigh, Vic dropped the oars in place and started to pull. He hates rowing when off for a sail, and his first strokes were gentle. We didn't seem to move. "Confound the weeds," he said, and pulled harder. Still no move. He ground his teeth together, humped his back and gave a lift that would raise a church mortgage. The next instant he was flat on his back in the bottom of the boat, trying to think of something suitable for a Sunday school teacher to say under such circumstances. We were on drowned land, and had stuck on the branch of a submerged tree. Vic's last pull had started us so suddenly that his vigorous effort found insufficient resistance to balance the enormous surplus of power.

Well, we found the creek, and found the rapids, the latter being rather pretty, though not very imposing.

On landing we scattered in search of huckleberries, and then, driven by hunger, found a picnic ground and unloaded the boat.

II.

Now let's talk of graves and worms and epitaphs. Vic was standing by the boat. I was standing on a rock near by, and the girls were setting the tablecloth some 50ft. away among the bushes.

"Bring up the lunch basket, Vic," called a dulcet voice.

"Everything is up there," Vic called back.

"There's no lunch basket up here," cried several voices together. I looked at Vic in blank dismay, and Vic looked at me. The lunch basket had been left behind.

It was just like Vic to blame me for it, and to ask me why in thunder I didn't look to see that everything was aboard before we started. I told him that it wasn't my basket and it wasn't my picnic, and that I never cared much for lunch anyway. I had him there, for he was hungry for every meal, and half the time between meals too.

But the girls—the mild reproach in their eyes made us sink our differences and try to find some way out of our dilemma.

It meant a five mile trip with the thermometer over 90 degrees to go back home, and the wind had almost vanished. Returning was not to be thought of.

It then struck me that, nearer the end of the lake, I had noticed a log house and clearing, and I proposed to Vic that we go there and see if they had any bread to spare. This produced a very visible rise in spirits.

Then some one mentioned that we had the ice box with the milk, butter, pickles, berries and a tin of beef, and at once the spirits of the party became about normal.

It was a pretty walk to that house along a wagon track leading through the shade of an open second growth of oak, maple and other deciduous trees, with here and there near the lake the gaunt, bare trunk of some old burnt pine.

After some fifteen minutes' walking we came to a clearing, and there stood the house, a two-story log affair with a potato field in front of it and wilted looking cabbages behind.

Three boys ran out to meet us, respectively 3, 3½ and 4ft. in height, each clad in a pair of well patched knickerbockers, a blue cotton shirt and an old straw hat with a sugar loaf crown. I don't know whether the younger boys had tails to their shirts or not, but I am sure the eldest had, for it was sticking out of a hole behind.

"Is your ma in, boys?" said Vic. A shrill cry of "Ma!" brought out a stout, good-humored, middle-aged woman, with bare feet, a blue gown and a crease around her where a belt indicated her waist ought to be.

Time was precious, so we went straight to business and asked for bread.

"No, sir. We haven't a bit in the house, and won't have till the boat comes in from Young's Point this evening."

Vic looked at me reproachfully, as much as to say, "See what your grand scheme has amounted to."

But I wasn't going to be beaten that way, and the idea of hot biscuits floated into my mind. I broached the subject to the old lady, and she took to it like a black bass to young frogs.

"Emmy," she called, and a slighter edition of the old lady appeared, similarly clad.

"Can you bake these gentlemen a pan of biscuits?"

Emmy thought she could.

I suggested that there were five of us, and we were hungry.

"Better bake two pans, Emmy."

Emmy said she would.

"How long?" said I, "and how much?"

Emmy thought about half an hour would do it, but

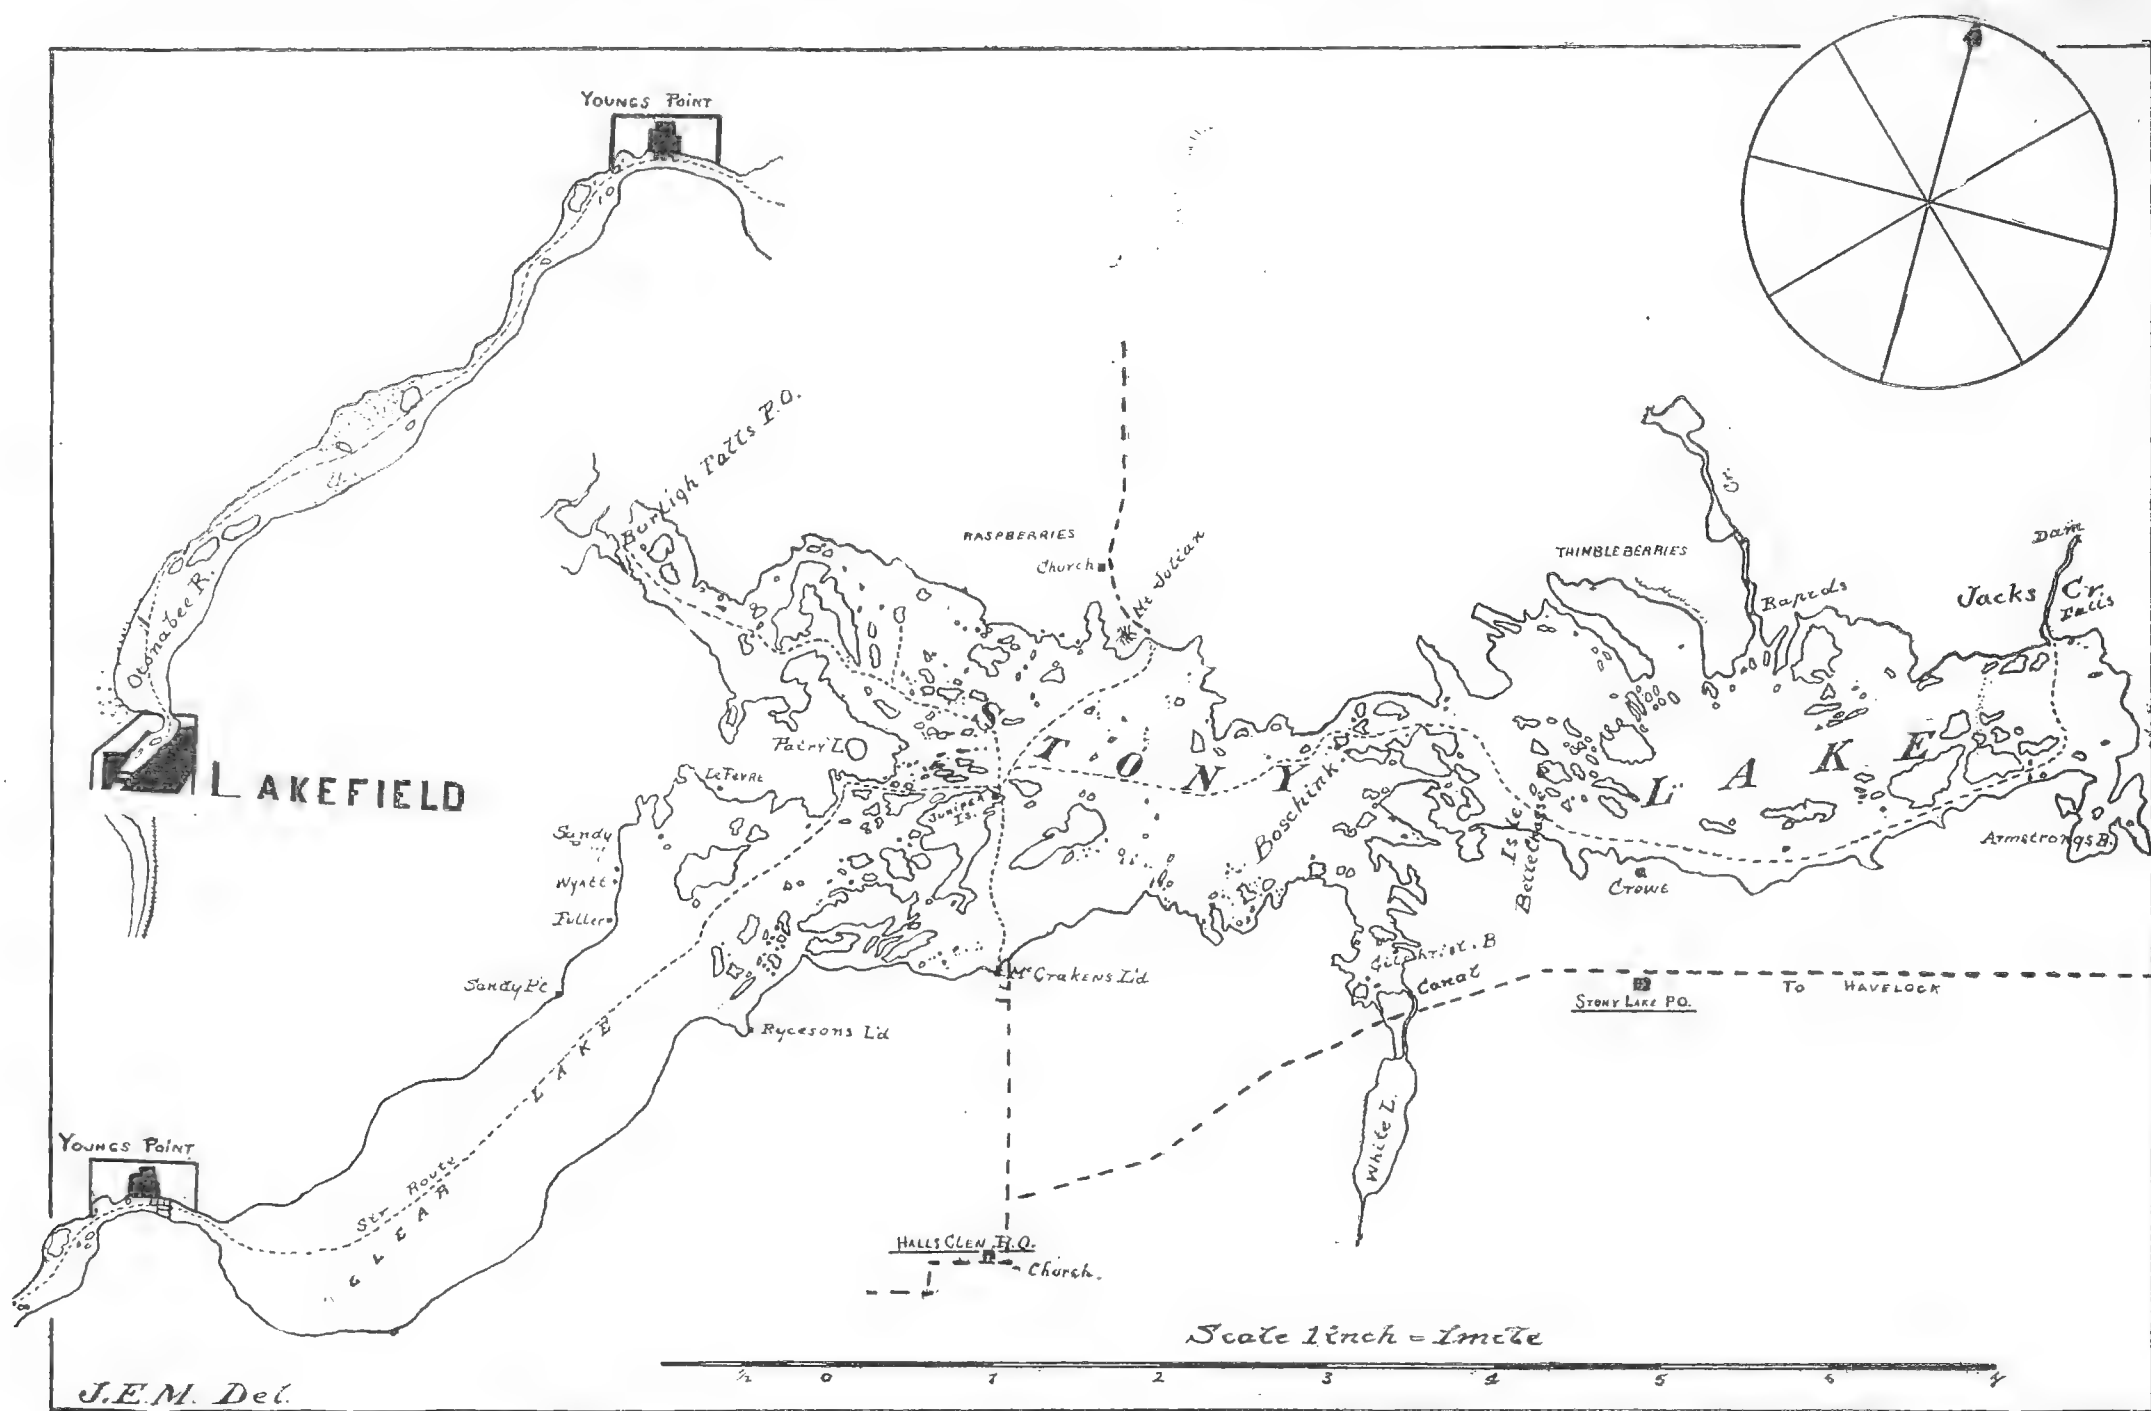

CHART OF STONY LAKE, ONTARIO, CANADA.

hesitated about the price, so I produced a quarter, which seemed quite satisfactory.

We went back to camp and announced the good news, which seemed to completely reinstate us in the good graces of our crew.

After a sufficient lapse of time we retraced our steps toward the old log house, but, as Vic seemed to have important business among the berry bushes, I went up alone to the house. The old lady said the biscuits were not quite ready, and wouldn't I walk in and have a glass of milk. I walked in, had as much delicious milk as I could drink, and then discussed crops, weather, hard times and local geography with the old lady till Emmy was ready with the biscuits.

When Emmy handed me the very largest kind of a milk pail three-quarters full of most appetizing biscuits, I thought to myself I had the cheapest quarter's worth of grub I'd bought for a very long time. Down the lane I met Vic.

"What have you got in that pail?" he shouted.

"Hog feed," I replied. "What did you suppose?"

He said nothing, but lifted the cover, looked in and then shouted and yelled in that exuberant fashion for which he is noted.

Did we have a good dinner? Well, we had only two jack-knives to eat it with and our butter knife was carved from a piece of wood; but if you happen to meet Vic, and put the question to him, he won't say anything to you, but will merely close his eyes and gently rub the region about the fifth button of his vest, from which, if you are wise, you will gain all the information necessary.

After dinner we stretched out in the shade and lazily watched the lengthening shadows and listened to the purling of the rapids near at hand.

Vic dozed off, woke up, and said he was not a bit sorry I had left the basket behind, and strange to say, such a great content was on me that I let the remark pass without the least attempt at contradiction.

A little later a sweet little thing roused herself from her reveries and asked me if I was sure they were nice clean people who had made the biscuits. An hour before she wouldn't have cared if they had been made by a greasy Hottentot in a swill bucket. I didn't want to spoil the dinner she had just eaten, so I told her the little boys were all dressed in Fauntleroy suits and wore kid shoes with patent leather toes, that the old lady wore a muslin apron and a white cap, and that Emmy looked like a Watteau shepherdess. Just then the boys came along to get the pail. The sweet little thing looked the boys over very intently for a while, and then gave me a look of the utmost scorn, further refusing to speak to me for nearly an hour.

The boys told me that near the track leading up the creek there was a spring of water which was always icy cold. I walked up the track and found a little path leading off into the shady thicket. Black leaf mould was under my feet, and brakes and ferns rustled and waved as I brushed past them. There, deep in the shade, a keg was sunk to its rim in the moist earth. At the bottom the clean sand danced as the pure crystal water bubbled through it, and welling over the edge, trickled off among the mosses till lost in the depths of the wood. I drank my fill, and dipping up a can full, took it back to our hot and thirsty party.

III.

Vic reasons curiously sometimes, and when we started back he suggested that, as I knew the lake better than he, I might as well take the tiller. Now, why didn't he reason that way when we left home? Well, my view of the matter is that when we left home the breeze was fresh and the man forward had to sit up on the gunwale; now

the breeze was lighter, and the man forward could lie in the bottom of the boat with his head in somebody's lap. But please don't mention to Vic that I said so.

I really envy Vic sometimes; every one of those girls treated him like a favored younger brother, and as for me—well, I was a married man, and they knew it.

The breeze in addition to being lighter than in the morning had drawn more into the west, so we worked toward home with a short leg toward the southern shore and then a long leg westward. Just east of Boschink three islands head the archipelago through which we had sailed on the outward trip, each crowned with a large summer cottage; now the wind led me to keep clear of them entirely in the more open water to the south.

The southmost of the three islands of which I have spoken was called Isle Belle Chasse, and as it was at that time unoccupied, there we landed for tea. I thought Vic would be ashamed to look a bun in the face, but he seemed as hungry as ever, yet so large was our supply that, when tea was over, we seemed to have enough for several more meals just as hearty.

But the best part of our day was yet to come. The moon was not yet full, and already touched the wavelets with spots of silver, while the setting sun was still tinting land and water with a rosy glow. Round the end of the island a crane went flying by with curving neck and long legs trailing far behind. Out in the lake two loons chuckled and laughed like maniacs. In the woods near by the persistent plaintive cry of a whip-poor-will sounded mournfully through the evening quiet. The peace of it fell on us like balm, and the cool breath of the evening breeze was like a mother's touch on the fevered brow of a little child.

Shall we go in? No, let us sail on and on till old Mother Nature has taken us to her breast and told us wonderful tales, and shown us wonderful sights, and filled our ears with her wonderful lullabies—then we will go home and sleep the dreamless sleep of those to whom she thus reveals herself.

So we glide on and on past our island home, and out through the narrows into the open waters beyond, leaving behind us the dreaming islands and the narrow channels now black from side to side with their dim reflections.

Outside the moon flooded us with mellow light, not the cold pale rays of winter, but warm with the yellow tinting of a summer haze. The breeze blew fresh and steady, and back and forth we raced across the lake, throwing off a curl of frosted silver from our bow with a swish and swirl very pleasant to the ear. Except under the moon every tree clad island gloomed dark and mysterious. There a few tree tips touched with moonshine broke the line of black, and a lane of light cut the dark reflections to the shore. Over toward Juniper Island the red and green lights of the steamer shone out; but soon the red disappeared and we knew she was heading up for Mt. Julian in the darkness of the northern shore.

It was hard to pick out the narrow channel in the belt of black to the east, but why should we trouble, here comes the steamer, and she will take the southern channel and so to Breeze's, near our home. In her wake we may safely follow; no danger there. Puffing and snorting, she passes us, and after her we dash till the swinging lights show her turning rapidly to port. But where are we? This seems strange to the eye. I glance under the sail and see not, as I expected, an open channel, but a black and threatening mass apparently right upon us.

In a flash we are about on the other tack, and then our whereabouts is plain. The steamer has taken a course south of Hoover's Island, instead of to the north, and there she is stopping up at Breeze's.

Ah! well. Our pleasant sail was ended all too soon,

and we were at our cottage door, bearing with us affectionately the remains of Emmy's pans of biscuits.

But what had been going on at home during this eventful day? The Major Domo had remained behind to keep the Mater company, and about 6 o'clock wandered idly down to the boat house. There on the dock, tinted with the same rosy light that shone upon our evening meal at Isle Belle Chasse, stood the missing lunch basket. He smiled a superior "just like them" kind of a smile, and then took the basket up to the Mater. She, poor soul, was straightway filled with anxious pity.

"Oh! the poor things. They'll surely be starved to death."

"Oh!" said the Major Domo, with cheerful confidence, "I'm sure they are all right. If they are starved to death they would have been home long ago."

This was rather doubtful consolation, but it seemed to comfort the Mater. Not, however, till we arrived was she entirely easy, and even then the story of our adventures was often interrupted with sympathetic exclamations of "Well, well!" "Indeed," "You poor things," and "Well now, how fortunate."

As I said at first, Vic still persists in blaming me for the mishap, but I now refuse to discuss the point further. In any case, "All's well that ends well," and I reminded him that, if the lunch basket had not been left behind, we couldn't have had Emmy's biscuits warmed up for breakfast the two following days, which would have been a distinct loss to all of us.

J. EDWARD MAYBEE.
TORONTO, Jan. 19

Canoe Fittings.

NEW YORK, Jan. 21.—*Editor Forest and Stream:* In the last issue of FOREST AND STREAM are some comments by Mr. W. Baden Powell, who laments the fact that in England it is not the custom for dealers to carry canoe jewelry in stock.

I was wondering how such a state of affairs was possible in the country where the sailing canoe originated, and my wonder continued until further along in the article I struck his elaborate suggestion regarding lamp, compass, clock and barometer.

Possibly, unknown to himself, Mr. Baden Powell has explained why it is so hard to procure ready-made fittings over there.

When one of the brightest and best known of English canoeists prefers an acetylene lamp, with its specially prepared and almost unobtainable fuel, in preference to a kerosene bicycle lamp, which can be filled at any house using lamps; when he gives minute directions for the manufacture of a glass-fronted box in which to hang a clock and barometer in a canoe cockpit, instead of carrying a cheap watch and a pocket aneroid, how is a dealer in boat fittings to manage to make from his own design articles sufficiently cumbersome and intricate to satisfy the rank and file of the cruisers?

E. T. KEYSER.

[We understand that Mr. Baden Powell's remarks apply in part to the larger types of canoe-yachts and single handers, as well as to the one-man canoe.]

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1899, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, FEBRUARY 4, 1899.

VOL. LII.—No. 5.
No. 846 BROADWAY, NEW YORK

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

THE WILD PIGEON.

THE two notices which appear in this week's paper of the occurrence of the passenger pigeon call renewed attention to the subject of this bird's disappearance, on which so much has been written. The contrast between the enormous former abundance of the pigeon and its present scarcity leads us to speak of the species as having become extinct, a statement which is by no means exact. Although, in the wholesale slaughter of this species for commercial purposes, abundant reason is found for its disappearance, there are very many people who do not accept these reasons as sufficient, but who believe that the wild pigeons, owing to the persecution to which they were subjected, have gone off to some distant and unexplored portion of the continent, and have there hidden themselves. Precisely in the same way, the Indians of the plains, when the buffalo were exterminated a few years ago, declared that it was impossible that they should all have been killed, but that the white man, for some occult purpose of his own, had taken them away and hidden them somewhere. So like is human nature the world over, whether it be civilized or savage.

In its old-time abundance the wild pigeon is no more, and for precisely the same reasons that caused the extinction of the buffalo; that is to say, because of the filling up of the country and the opening up of the haunts of the birds by railroads, which thus brought the trapper's prey close to a market. Yet a few wild pigeons remain scattered through the Northern States, and since their numbers are now so small that they are free from the persecution to which they were formerly subjected, we may look to see them very slowly increase and to gradually be more and more often seen.

The increase will be slow, because the pigeon is a slow breeder, laying but one egg, or at most two eggs, at a nesting. Had the increase been more rapid than this in the time of their former abundance, their numbers would have been so vast as to sweep the continent bare of food, so that the whole race must have perished by starvation. It is difficult to imagine what would have been the result to this continent if the old-time pigeon roost of fifty or sixty years ago had been multiplied by ten after each nesting.

To-day, however, the passenger pigeon is practically free from pursuit by man and has to dread only its natural enemies, which are now extremely few, the swift hawk being almost the only one. True, if a pigeon flies within shot of a man carrying a gun, he will kill it if he can, for the bird's rarity makes it a thousand times more desirable to the average gunner than it formerly was, and each man, feeling that this will be his only chance to kill a pigeon, craves the bad distinction of securing the last of its race. Happily, however, pigeons are so scarce that few are likely to be shot, and happily also there is a small proportion of sportsmen who would decline to shoot at one of these birds for the very reason that they are so scarce.

Therefore, just as is the case with certain other of our game birds, an increase in the wild pigeons will take place until they shall again become sufficiently numerous to tempt the man with the gun, whether he be sportsman or ornithological collector, and also to tempt the egg-collecting small boy, to whom, of course, the egg of this now rare bird is most desirable. When their numbers have grown to this point they will again be pursued, but because it is unlikely that they will ever so increase as to nest in great companies, the pigeon will always be a bird to be killed only casually and not to be systematically hunted. You cannot pursue wild pigeons with a dog.

So we may expect that the passenger pigeon will live long in the land, but never again as a bird found in enormous numbers, since the conditions which admitted of this old-time mode of life have passed forever.

OUR AMATEUR PHOTOGRAPHS.

To the FOREST AND STREAM amateur photography competition a large number of amateurs contributed work which was of a high grade of excellence. To make selection of the subject entitled to the prizes when so many were meritorious was a task by no means simple.

There were three classes; (1) for live wild game; (2) for game in parks; (3) for other subjects relating to shooting and fishing. Prizes were offered as follows:

(1) For live game photographs three prizes are offered, the first of \$50, the second of \$25, and the third of \$10.

(2) For live game in parks, for the best picture, a prize of \$10.

(3) For the best pictures relating to FOREST AND STREAM's field—shooting and fishing, the camp, campers and camp life, sportsman travel by land and water, incidents of field and stream—a first prize of \$20, a second of \$15, a third of \$10, and for fourth place two prizes of \$5 each.

The selection of the photographs entitled to the rewards under these conditions is as follows:

Live Wild Game.

First prize—"A Race with a Maine Moose." By S. B. Chittenden, Jr., Brooklyn, N. Y.

Second prize—"Young Sea Gulls Eating Fish." By F. F. Frisbie, Detroit, Mich.

Live Game in Parks.

First prize—"Red Fox in the National Park." By John Fosson.

Relating to the "Forest and Stream's" Field.

First prize—"A One-Night Stand." By Dr. C. D. Smith, Portland, Me.

Second prize—"Fishing for Bass at Sunrise." By R. C. Leonard, Central Valley, N. Y.

Third prize—"In Camp." By Noah Palmer, New York.

Fourth prizes—"Home of the Bighorn." By W. C. Knight, Laramie, Wyo. "The Strike and the Capture." By C. H. Smith, Buffalo, N. Y.

In addition to the photographs awarded prizes, there is a large number of others worthy of honorable mention. In the Wild Live Game class a photograph of two cub bears, sent by Mr. Livingston Stone, and one of a mink, by Mr. Geo. S. Raymond, call for special notice.

In the class of Game in Parks, a spirited moose portrait, by Mr. Fred Talcott; elk on the prairie, by Miss Edith M. Chapple, elk and mountain sheep in winter quarters in the Yellowstone Park, by Mr. E. C. Waters, and a Yellowstone Park bear, by Mr. J. E. Westlake, are of unusual interest and merit.

In the third division, of FOREST AND STREAM's field there were naturally more pictures than in the other classes. Among many deserving ones may be named an indoor study of game, dog and gun, by Mr. Leonard, and an outdoor study of quail shooting, by Mr. L. Pesha; bullhead fishing by moonlight, by Mr. Harrie E. Loftie; a marine view, by Mr. Stuart-Menteth Beard; whipping the Dog River Falls, by Mr. F. F. Frisbie; nest of least bittern, and one of Carolina rail, by Mr. James Savage; "Old Pard Getting Breakfast," by W. L. W.; fishing boats, by Mr. W. H. Bell; "Unchained from Business," by Mr. P. H. Felker; fly-casting, by Mr. W. H. Pierce; "Adirondack Days," by Dr. C. E. Fritts; "Woodman Spare that Tree," by Mr. C. J. H. Woodbury; "In the Prairie Chicken Country," by Mr. H. H. SNAP SHOTS.

Mr. W. G. Van Name, who in another column discusses the Lacey bill, is the author of a scheme, proposed through FOREST AND STREAM, to have the Government acquire at different points throughout the country tracts of land to be set apart and protected as game refuges. Mr. Van Name has set forth very cogently the utility of such havens of refuge for our migratory game, and the benefit which would accrue to the country at large if the system were in operation. We have always regarded the proposition as one of the most sensible ever made for

game protection; and we believe that some of these days it will be adopted. In the meantime, as we have suggested repeatedly, we need not await the action of Congress to secure in individual States the benefit of the plan. State game preserves should be provided. The Wisconsin Forestry Commission is urging the Legislature to convert a tract of the State lands into a forest preserve, to be cared for by a division of forestry, with its foresters. If the reserve is established, there should be incorporated in the law a provision to make it in whole or in part a game preserve also, and to give to the foresters the added duties of game wardens.

We give to-day a full report of the meeting of the Adirondack Guides' Association. Among other expressions of sentiment was a declaration in favor of deer hounding. This appears to be a change of opinion from that formerly held; for we have understood that the guides as a body approved the present law. Chief Game Protector Pond, who has just returned from a trip through the North Woods, reports, as a result of his observations, that the deer law generally has been well observed; and that the deer supply has increased within the last two years because of the operation of the non-hounding law. Major Pond is quoted as saying that "many localities where hounds were very numerous two years ago have nearly or quite gotten rid of them. Their former owners declare they have no desire to have the anti-hounding law repealed, not altogether on account of the number of deer that were killed during the lawful period, but on account of the great slaughter, from year to year, at a time when the snow is deep, by dogs whose owners were either too poor to feed them and wanted them to hunt for their living, or by persons so indifferent that they do not want the trouble of keeping their dogs chained."

If the present law is continued in force until the five years' term shall have expired, Maj. Pond estimates that by the termination of the period the woods will be stocked in their old-time abundance. He holds then that there is every reason to continue the law as it is for the three years remaining. Those who know Maj. Pond have great respect for his opinion in these matters; and in view of his expressed confidence in the wisdom of the present law, there is slight probability that any one of the hound-restoring measures now before the Legislature will become a law.

Rev. Myron W. Reed, of Denver, Colo., who died on Monday of this week, Jan. 30, was one of those who found in the sportsman's woods life a valued form of recreation. He knew well, and none could write of it more eloquently, that spirit in man which impels him to leave the cosy bed before dawn to take his place in the duck stand; and to undergo the rigors and hardships of camp life for the rewards of rifle or fishing rod. Some years ago Mr. Reed and Geo. W. Sears, "Nessmuk," camped together in the Pennsylvania mountains when speckled trout were rising to the fly, and after the acquaintance there formed Mr. Reed wrote to us that of all the men he had ever met "Nessmuk" was one of those best worth knowing. The tribute means all the more to those who have made test of the character-proving associations of camp life. That after living in camp with him one man should say of another that he had found qualities which made prized his companionship is one of the sincerest tributes possible to be paid.

A bill now pending in Congress is to amend the copyright law by prescribing that a newspaper which prints a reproduction of a photograph without the consent of the owner of the copyright shall forfeit to the owner \$1 for every copy printed, and \$10 for every copy found in possession, provided that the penalty so recovered shall not be less than \$100 nor more than \$5,000. Photographers now have all the protection they require; the present law as it stands is prolific of blackmail—probably more blackmailing is done under it than under any other statute; and if Congress shall enact the amendments now under consideration, the mulcting of publishers will increase ten-fold.

We notice recommendations and suggestions concerning the appointment by Gov. Roosevelt of new members of the New York Fisheries, Game and Forest Commission. As the terms of no one of the present incumbents expire this year, such discussion is untimely.

The Sportsman Tourist.

The Rainbow Country.

"Go to the end of the rainbow and you will find a pot of gold," the grandmothers of New England used to tell the children, as the little ones gazed wonderingly at the brilliant arch spanning the sky.

But the end of a rainbow is hard to find, and the pot of gold is as safely hidden as the buried treasure of Captain Kidd.

Many a pair of young eyes, however, has gazed wistfully over the hills to where the iridescent bow mingled its colors with the mists of some distant valley, too far away for little feet to attempt the journey. So the pot of gold has never been found, and the end of the rainbow is in No Man's Land. But the children are not the only ones who look "over the hills and far away," and wonder what lies beyond the horizon.

To those who love to seek nature among the vast solitudes of mountains, in the eternal silence of the wilderness, and on the lonely waters of far-off lakes, there is constantly an alluring temptation to go on and on; to find what is hidden beyond the distant summits that look so softly blue; to discover the secrets concealed beneath the green canopy of the forest, or to explore the unknown country across the water beside which the white tent gleams. And so it was that my steps were first directed toward the Rainbow Country, and if I did not find there a pot of gold, I found much that is better than wealth. The pursuit of a rainbow may not be as unprofitable as one might suppose—it all depends on the way one goes about it. As every one knows, the end of a rainbow is always a long way off, and there is always the danger that it may disappear before one reaches it; but anything worth having is worth striving for. Memories of what we accomplish and acquire by struggle and hard work are sweeter than those of the things that come to us for the asking. This is why my recollections of the Rainbow Country are among the pleasantest of my life, and I like to think that some time, if I live, I shall go back again and look once more on the pellucid waters and verdure-clad hills of that fair land.

One summer evening, as we sat by our camp-fire, and watched the afterglow tinge with gold the sky above the purpling western mountains, I asked my Wabenaki guide what lay beyond the range behind which the sun had disappeared.

"*Mahnagwanegwasebem*," was his answer in his own tongue, and I said that some time we would turn our faces toward the Rainbow Country, and launch our canoe on the seldom-visited waters whose Indian name he had spoken, Rainbow Lake.

From the summit of Katahdin I had seen it miles away, sparkling like a jewel in the landscape, and beautiful enough to be the abode of *Mahnagwan*, the rainbow, but the way to it is long and beset with difficulties, and comparatively few have been there. Even the ubiquitous and insatiable lumberman has not swung his destroying axe in its forests, for it lies among the mountains, away from the main routes of travel, and has no navigable inlet or outlet.

Several years were destined to elapse, however, before the consummation of the resolve formed by that camp-fire was assured. In the meantime many rainbows of varying degrees of brilliancy had spanned my sky, most of them leaving only memories of fading hues.

But there came a day—and what a clear, cool, brilliant day it was—when a canoe was hauled across the Northeast Carry, and Dennis and I, with our dunnage amidships, paddled down the West Branch, bound for the country of *Mahnagwan*.

I had come twelve hundred miles, journeying down that ancient highway of the aboriginal tribes and the early French explorers, the Great Lakes and the St. Lawrence River, to Montreal, and thence by the C. P. R. to Moosehead Lake. All the way across the broad waters of those unsalted seas, and down the swift current and foaming rapids of the mighty stream, my thoughts went back to the brave old days whose history is the romance and the tragedy of New France.

I saw the noble river again bordered with primeval forest and hearing on its waters the birch canoes of the red men and *coureurs de bois* and the batteaux of fur traders. I saw the black-robed priests, who, taking their lives in their hands, went forth to spread the knowledge of the only true God among the savage hordes, and the brave explorers who sought to make for France a new empire.

All day long the steamer sped onward down her devious and at times dangerous course toward the beautiful city at the foot of Mount Royal; and all day the procession of shadow canoes went upward, bearing those intrepid Frenchmen who, leaving the civilization of the Old World, bravely followed their savage guides into the vast and unknown solitudes of the New.

With these thoughts of the old regime in mind, I was glad that I should leave the railway where I could enter upon the nearest approach to that life which is now possible, without again coming in contact with our modern way of living.

The steamer arrived at Montreal at sundown, and a couple of hours later the train had left the lights of the city behind.

When, in the early morning, I stepped from the train at the little Moosehead station, the solitary occupant of the platform came toward me as eagerly as I went to him, and in a moment I grasped the honest hand of Dennis.

William and Harry, with their guides—two of our Wabenaki friends—were to arrive at noon from Boston, and would join us that night at the old camp-ground on Lobster Lake, where the point of rocks juts out from the sand beach.

As soon as I had breakfast we put our canoe and supplies aboard a small steamer, and were soon speeding toward the Northeast Carry, forty miles to the north of the head of Moosehead.

By noon we were across the carry and on our way down the West Branch. At 2 o'clock the canoe grated gently against the white sand of the beach on Lobster Lake, and the first stage of our journey was behind us,

We carried the luggage up to the rocky, wooded knoll where, under the protecting shade of the spruces and hemlocks, we proposed to pitch our camp. After this was done and Dennis was busy with his various chores, I went to the top of the little promontory and looked out over the water at the surrounding hills and mountains. The lake lapping against the rocks below and flashing in the sunlight invited me to a more intimate acquaintance with its cool, clear element, and I retraced my steps to the beach, where the empty canoe rested on the sand.

The camp, hidden by the rocks and trees, was not visible, and only the sound of Dennis' axe reminded me that I was not alone. I undressed, placing my clothes on a convenient drift-log, and waded into the lake till the water was deep enough for swimming. The bottom was hard, white sand, and the water cool enough to be exhilarating, but not so cold as to chill. I revelled in it, swimming, floating, or standing with my eyes close to the surface looking across the broad level till it merged with the distant shore. Dennis' axe was now silent, and no sound came across the water but the low, soothing whisper of the breeze in the pine-tops. Suddenly I felt, rather than saw, a slight movement in the bushes, and with only my head out of the water, watched. They parted, and a graceful head, crowned with a pair of velvet-covered horns, emerged from the leafy screen, followed by the body of a handsome buck. Sniffing the air and looking about for any possible danger, he came down a stony path, and with dainty steps crossed the sand to the water's edge. Wading in to his knees, he lowered his head to drink; then stood looking out across the lake, occasionally turning toward the woods behind him. I watched while he wandered about the beach, now nibbling at a bunch of grass, now splashing in the water, but no tell-tale whiff of air told him of my presence. I gradually approached the shore, keeping only my head above the surface, till the water shallowed so that I crawled on my hands. The deer did not look for danger from the water, and I enjoyed a rare opportunity of observing a wild creature in its native haunts, unconscious of the presence of an enemy.

I could see every motion of his eyes, nostrils and mouth, and every nervous movement of his body and limbs. When I thought I had been in the water long enough, I suddenly stood up and waved my arms. Instantly the noble head lifted, his legs became rigid, and he stood looking at me, a grand woodland picture.

Then turning, he sprang swiftly away and disappeared, a flash of his white tail being the last I saw of him. After I had dressed, Dennis took his axe, that most important of all the implements of the woodsman, and we went across the cove in the canoe to get some fir boughs for our beds. A good-sized balsam was selected, and it soon came crashing down. We broke off the branches, loaded the canoe with them, and paddled back. The tent was bedded down, wood chopped for the night, and preparations made for supper. From the point of rocks we could look across the lake to the outlet, two miles away, and as the sun sank low to the western mountains we watched the distant shore line anxiously.

Twelve months had rolled by since I had seen those whom we expected, and now that the hour drew nigh I waited with impatience. The sun sank below the undulating sky line of the mountains; far away to the eastward the mighty bulk of Katahdin melted into sky as the tender light of evening replaced the glare of the passing day, while the nearer peaks softened and grew dim.

Still we watched the far-away shore, apparently unbroken, but where we knew the stream carried the waters of the lake to the West Branch. At last, when the light had become almost too dim to see, our gaze was rewarded by the sight of two shadowy objects that seemed to separate themselves from the shore and drift out upon the lake. We saw them head in our direction, and we ran to our canoe and paddled out to meet them. Midway of the lake we drew near each other, and two waving hands greeted us before we heard their voices calling across the waves. Then the canoes came together, and there on the broad, heaving bosom of the lake, surrounded by the black border of forest, and under the jeweled sky, we had a little reunion, solemnized by the pressure of hands and softly spoken words. At the camp the smouldering fire was quickened into new life, and as we sat around it eating our supper—four men with white skins and two with red—I seemed to realize for the first time that my long-anticipated journey to the Rainbow Country had begun.

The fire itself, as the flames rose and fell and the sparks flew upward, seemed like an old friend, for a camp-fire is different from other fires. The lighting of the first camp-fire is a ceremony, and one of the supreme moments of the wayfarer in the woods. Till this is accomplished the outdoor life is not fully entered upon, nor the bond that holds one to the city entirely severed; but when the first tiny flame reaches from the birch bark to the pine splinters, and then leaps crackling to the larger sticks, lighting up the shadowy forest and casting a ruddy glow on the faces watching it, its warmth is reflected from the heart. Where it burns is the camper's hearthstone, and around it are his lares and penates—it marks his home.

It is the altar flame of those who worship at Nature's shrine, and who find themselves, in getting close to Nature's heart, drawn nearer to Him who is the Creator of all.

So we sat and smoked after our meal, while the fire glowed and sparkled, the wood cracked and snapped, and the sparks soared upward, only to dissolve in the blackness of the night. The wind sighed through the trees, and the restless lake washed against the rocks. Once the sweet call of a white-throated sparrow came from the dark forest. The spell of the woods was upon us and we talked little, but looked, listened and thought much. It was good to see the others sitting by the fire, to hear the familiar voices, to think of the days before us and of other days long past.

"My words fly up, my thoughts remain below,"

said the Danish King, and our words were but the sparks that came from the thoughts brought into being by that first camp-fire.

Two mornings later we broke camp at the foot of Ripogenus Lake, and prepared to make the first stage of the carry to Rainbow. On a previous trip we spent

two days making the three-mile carry around the wild Ripogenus gorge, on our way down the West Branch to Katahdin, but now we took another path that led over the hill to the right. It was a rough blazed trail, that led us up hill and down, and finally terminated in a cedar swamp in the dismal shore of Chesuncook Pond.

A more desolate place would be difficult to find. The trail first touched a cove filled, not with water, but with bottomless black mud, then wound a devious course through the woods to another cove. The ground was soft and spongy, and the cedars so thick that our loads were carried between their shaggy trunks only with difficulty. Gray moss, the *usnea* lichen, hung from them in long festoons, and roots and branches obstructed the trail. Pools of water were more in evidence than dry ground, and the light, dim at best, was made more so by a cloudy, overcast sky. The stillness was oppressive, and it was a relief to have a big doe jump from her bed among the high brakes at the top of the ridge and go leaping away into the woods. On our second trip over the carry drops of rain began to spatter on the dead leaves, and by the time we deposited our loads under the canoe it was coming down in earnest.

We put on our rubber coats and boots and waited for Nick and Jean to come with their canoes. A rainy day in the woods was too old a story not to be taken philosophically, and we sat patiently while the sky grew darker and the drops came faster. At last we heard the welcome sound of footsteps and the swish of branches, as if some large body was forcing its way through the bushes, and the Indians, with their canoes on their heads, came in sight. Placing his burden tenderly on the ground, Nick glanced at the sky, then at the narrow, crooked path along which Jean was struggling with his canoe, slipping and stumbling, and with difficulty guiding his unwieldy head-piece, and said: "I ain't goin' lug my canoe through them cedars; I guess I can shovel him through that mud. Looks like it settle down to rain all day."

Lifting the canoe from the shore, he placed it in the mud and stepped into it. For the first stroke or two the light craft moved quite easily, and then the sticky mud seemed to grasp it, and it took all the strength in Nick's herculean frame to force a passage. It was actually shovelling. His paddle bent till it seemed as if it must break under the strain, and the muscles and cords of his arms and neck swelled almost to bursting. Great masses of mud were lifted at each stroke, while bubbles of gas rose from the slimy depths; but the guide gained foot by foot till the canoe slid into deep water. In the meantime the other canoes had been loaded, and as soon as Nick was ready we started.

In many miles of travel through the woods I never saw a wilder sheet of water than Chesuncook Pond. The shores are densely wooded with spruce, fir and pine, the water is black, and a number of picturesque, rocky islets dot the surface. When we reached the carry on the other shore the rain was pouring and the atmosphere had become cold, but we found comfort in the fact that we were on the threshold of the Rainbow Country, and before the rainbow there must be rain. We decided to take over one canoe, our blankets and food for supper and breakfast.

The taking-out place was almost indistinguishable, for the old trail was long abandoned and unused. It lay under the shadow of great trees and was completely grown up with bushes.

Nick forged ahead with his big canoe, its inverted bow parting the foliage as it was wont to part the waves. The others followed in Indian file, each with his own burden, borne on the back and supported by straps across the forehead, and around the shoulders under the arms, thereby distributing the weight. Over old, slippery corduroy, fallen timber, rotten logs, and rocks, through mud and water, we followed our leader.

Once Nick fell heavily, the canoe crashing down on top of him, but before we could reach him he was on his feet again, picking his way along the treacherous path.

Meanwhile the rest of us had various troubles of our own, and only those who have experienced the vicissitudes incidental to voyaging in the wilderness can appreciate the trials and tribulations that await him who totes a load over such a carry.

The rain continued without abatement, and the wet bushes wiped across our faces and clung to our legs, while our packs developed a pernicious and persistent habit of catching on branches and stubs. After a while we left the swampy level and then up, up and up the mountain we went through grand old timber untouched by the axe. There were no stumps to tell the melancholy tale of monarchs of the past, but great spruces, pines and birches towered grandly above us.

The broad leaves of the moosewood hung across our path, and the mossy ground was covered with the brilliant green and scarlet of the birch berries, and the three-lobed leaflets of gold thread, the *clintonia borealis* was common everywhere in the woods. For a mile or more we climbed steadily upward, and then, after resting, began to descend. The woods were now more open, and the way less encumbered with underbrush, but the great trees were everywhere, and signs of game abundant. We saw moose sign frequently, and a number of bear trees, with the marks of bruin's claws in the bark.

We kept careful watch for the spots on the trees, for the trail was an old one, blazed out by a Wabenaki hunter, and the marks were dim and indistinct. Several sable traps by the path showed where he had pursued his vocation of trapper in past winters. In each case a tree had been felled, leaving a stump about 5 ft. high, so that it would be above the snow. The top was chopped out to form a box about a foot high, open on one side, and then a piece of wood split from the tree nailed on for a roof. To set such a trap, the bait is placed in the back of the box, and the steel trap in front, in such a manner that the sable can only reach the coveted food by passing over the trap. Chips of rotten wood are crumbled over the trap till it is just hidden, and two twigs bent in such a way that to get at the bait the animal must place its foot on the trencher. Many a pelt has been taken by Louis from his line of traps, and his winter camp, snugly hidden in a little clearing near the outlet of Rainbow Lake, was to be our shelter that night. We had not eaten since morning, and were wet and chilled. As the

Natural History.

Elliot's Wildfowl.

IN presenting to the public his book on the "Wild Fowl of North America," Mr. Daniel Giraud Elliot has completed the service to sportsmen which he began some years ago. The three volumes on Shore Birds, Gallinaceous Game Birds, and Wild Fowl of North America comprise a series of illustrated accounts of North American game birds, which include everything except the unimportant rail. As Mr. Elliot says, "It is a noble list; one few countries of the globe can equal in importance and variety. For numerous reasons, not the least of which are the economic, these birds are a most valuable possession to the people of this land, to be

(*Cygninae*), the geese (*Anserinae*), the wood ducks (*Plectropterinae*), the fresh-water ducks (*Anatinae*), the sea ducks (*Fuligulinae*), the spine-tail ducks (*Eristomaturinae*), and the mergansers (*Merginae*). In many respects his nomenclature differs from the A. O. U. Check List, for the author has not hesitated to make such changes as seemed to him desirable. Thus Ross' goose is put back into the genus which Mr. Elliot formed for it more than thirty years ago. A new derivation is given for *Branta*, the old *Aix* becomes *Aex*, *Aythya* is corrected to *Aethya*, while the canvasback is put in the genus *Aristonetta*, a name which fits it well, for it means the best of ducks. There are other changes in generic names, one of which is the use of *Harelda* for the misspelled or misprinted *Harelda*.

The charm of Mr. Elliot's biographies, familiar to us for so long many years, increases rather than diminishes with time, and in the 300 pages of the present volume there is much to delight the thoughtful reader. An

Ross's Snow Goose.

Long-Tailed Duck, Summer Plumage.

A pile of wood was already split, and we soon had a fire roaring in the stove. Supper was started, and we removed our wet clothes and made ourselves comfortable. The camp contained two wide bunks, a table and stool,

protected with watchful care. Have we been faithful to our trust?"

The present volume is similar in plan to those which have preceded it. It is an account of the wildfowl of

extremely interesting observation on the song of the dying swan, long supposed to be mythical, is worth quoting in full. Mr. Elliot says: "I had killed many swan and never heard aught from them at any time save

Trumpeter Swan.

Labrador Duck.

all made on the spot; a chest held blankets and clothing, while shelves were handily arranged for small articles.

Snowshoes, moccasins, traps, stretchers of various sizes for mink, sable and other skins were there, as were augers, axes and other tools, all telling the mute story of the lonely life of a trapper during the long winter, when the snow lies deep in the woods and the icy wind howls through the mountain gorges. Outside the door stood a large frame for stretching moose and bear skins. The interior was clean and neatly kept, and with a hot meal inside, and warm, dry clothing outside of us, we sat by the fire and complacently listened to the rain, which was falling again, and watched the growing darkness of the night.

We had found the Rainbow Country, and the sun's last rays, struggling for a moment through the clouds, drew across the heavens the sign of the bow, and under the arch, showing dimly through the mist, was Katahdin. Then the clouds closed in again and night came on apace.

W. A. BROOKS.

You cannot imagine how much I have enjoyed a second reading of your book, "Men I Have Fished With." It contains more correct natural history than all the text books.—Charles Hallock to Fred Mather.

North America, north of Mexico, and includes the swans, geese, ducks and mergansers, with accounts of their habits, nesting, migration and dispersion, with descriptions of adult and young. It is a book, as stated on the title page, for those "desirous to know how to distinguish these web-footed birds, and to learn their ways in their native wilds." It is emphatically a book for sportsmen. This is but natural, for Mr. Elliot is as keen a sportsman as he is a naturalist, and he knows well what it is that sportsmen desire. Having in mind especially this class, to which he himself belongs, he fitly opens his book by calling attention to the continued and ever increasing destruction by sportsmen and others, and to the fact that wildfowl are becoming year by year less plentiful, so that before long many of them will be so scarce as to be practically extinct.

Of the sixty-two species here described, six or eight are mere stragglers from Europe, and not likely to be met with by any gunners. There are three species of swans, fourteen of geese, including the brant, four of mergansers, and the remainder are true ducks, though in several different groups. Mr. Elliot reverses in this volume the order followed in the A. O. U. Check List, and begins with the swans as the most important species, ending with the mergansers. He divides the North American *Anatida* into seven subfamilies, the swans

the familiar notes that reach the ears of every one in their vicinity. But once when shooting in Curricket Sound, over water belonging to a club of which I am a member, in company with a friend, Mr. F. W. Leggett, of New York, a number of swan passed over us at a considerable height. We fired at them, and one splendid bird was mortally hurt. On receiving his wound the wings became fixed, and he commenced at once his song, which was continued until the water was reached, nearly half a mile away. I am perfectly familiar with every note the swan is accustomed to utter, but never before nor since have I heard any like those sung by this stricken bird. Most plaintive in character and musical in tone, it sounded at times like the soft running of the note in an octave.

'And now 'twas like all instruments,
Now like a lonely flute;
And now it is an angel's song,
Which makes the heavens be mute.'

and as the sound was borne to us, mellowed by the distance, we stood astonished and could only exclaim, 'We have heard the song of the dying swan.'

"I made inquiries among gunners as to whether any of them had ever heard notes different from those usually sung by the swan when he was mortally wounded,

and some said they had and * * * described something similar to those we had heard, and of which I have endeavored to give an idea."

Hardly a page of this interesting volume can be turned without learning something new, for Mr. Elliot's experience extends over many years and over many lands, and wherever he has shot he has done so with his eyes wide open.

Like most thoughtful sportsmen of large experience, Mr. Elliot is heartily opposed to the pernicious practice of spring shooting, realizing that this has contributed perhaps more than any other one thing to the reduction in the numbers of our wildfowl. He closes the effective introduction to his work in these words: "North America at one time probably contained more wildfowl than any other country of the globe, and even in the recollection of some living the birds came down from the Northland during the autumn in numbers that were incredible, promising a continuance of the race forever. I have myself seen great masses of ducks and also of geese rise at one time from the water in so dense a cloud as to obscure the sky, and every suitable water covered spot held some member of the family throughout our limits. But those great armies of wildfowl will be seen no more in our land; only the survivors of their broken ranks. Let these then have the protection which is their due, and our advantage and profit to accord; stop all spring shooting within our borders, a time when the birds not only are usually poor in flesh, but are mated and journeying northward in obedience to the command, 'be fruitful and multiply'; frown down all such barbarous customs as 'killing for count' and then with the impartial enforcement of the laws upon all the people, a remnant at least of our noble water fowl may be preserved to future generations."

Most of the illustrations are very effective, and we are permitted by Mr. Francis P. Harper, the publisher, to present some of them here. Some of these plates are from the pencil of Mr. Sheppard alone; others are the joint work of Mr. Sheppard and the author, while four are reduced copies of paintings made by Joseph Wolf. The frontispiece is a capital portrait of the author, which all who possess his books will be glad to have. Of Ross' goose, perhaps the rarest of the winter visitors to our land, which is chosen for one of our illustrations, it may be said that it appears regularly during the autumnal migration in certain parts of Montana, and last autumn we knew of one man who secured sixteen in an evening. Early in November we saw a flock of perhaps seventy-five.

It is not easy to speak in moderate terms of the value of these three volumes of Mr. Elliot's to that very large class which takes its recreation with the gun. The books will have a place in the libraries of most sportsmen, and will constitute for their author an enduring monument.

Some Florida Birds.

Little Blue Herons.

FOR years it has been an ambition to possess a pair of American egrets (large white cranes) for the lawn—certainly the handsomest bird in Florida; so when an old woman living on the outskirts of civilization reported that she knew of a nest of these birds, we quickly agreed to take them when old enough to leave the nest. The woman and her boy soon brought them to town; the birds numbered four and were snowy white. Two of them had yellow legs and beaks, the legs and beaks of the other two were a bluish black. Being so well feathered and so small, suspicion was aroused as to whether they were large white cranes or not, but the strong assurance from the old woman as to the size of the parent birds calmed the doubt for a while. The birds were put into a large wire coop, where they apparently were well satisfied, asking only that they be given plenty of beef and minnows. In a few days it was decided to give them the freedom of the yard at feeding time; they would hop around, gradually growing stronger in wings till they could fly onto the shoulder. Such liberty, however, reminded them of freedom, and they would object to returning to the cage. They were pugnacious little fellows, showing no fear of anything, but with ruffled feathers would run and "squak" at the pup or cat, who in turn would run to their owner for protection. The dog and cat, as eager for beef as they, would stand by their master's side or between his arms, the birds on his knee or shoulder, all eager for the coveted beef, and apparently feeling that bond of sympathy that emanated from their surroundings—each sensitive to this influence while under the protection of a strong nature, but so soon as they were in the open again quickly commenced the attack on the dog or cat, who of course were not permitted to retaliate. Soon these birds commenced to spread their wings and practice flying, looking like so many pigeons on the green lawn. So lightly did they move that their flying could best be compared to the white down of a thistle, as it floats through the air. It was now that our disappointment came, when the tips of some new feathers showed a dark color, and a hunter informed us we had only gotten the "little blue heron," a very common bird in Florida, which in its young state is snow white, changing to a bluish or brownish gray by the second year. On learning that the birds would never grow much larger, and for this reason would have to be kept confined, as otherwise they could get through the paling fence, they were disposed of to a friend. It is remarkable to note how quickly the wild birds of the forest—the cranes, herons, etc.—take to domestication. We had these little herons but a week, and in that time they grew as gentle as kittens, while the leghorn chickens, whose ancestors have crowded around man's home from the old Roman days to the present, are always on the alert, moving off from their feed at a close approach from any one.

A Young Eagle.

Last spring, when all the world was looking anxiously toward the American eagle and her cause, two young eaglets were hatched in a tall cypress tree on the edge of a prairie about sixty miles from Kissimmee. A native watched the site, and one day felled the tree; one

eaglet gave up its life, the other was found alive. The man brought it to town in an ox team, and on its arrival it was barely breathing. It was quickly given beef and water, and while the poor thing could not support its head from extreme weakness, it showed its appreciation by giving forth a gurgling sound. It soon learned to drink water from a spoon, then a cup, and within a couple of days could sit up. The bird slept a great deal, resting flat on the ground with wings slightly spread and his head lying to one side. This at first we supposed was from extreme weakness, but he continued this, using the perch between times, when he would apparently be in a deep study, but not asleep. What an immense bird he was, and what a sweep of wings he had! In color he was almost black, the luster

LITTLE BLUE HERONS.

on his feathers being exquisite. His beak was black, his feet and legs yellow, while his dark brown eyes were the perfection of beauty in their wondrous way of changing. During his short stay he was so gently cared for that he learned no antipathy for anything, although his eye would scan closely the kitten or the dog as they, innocent of the dormant strength that lay beyond those talons, stood by while the bird devoured his fish or beef. At first the eagle was so ravenous that he swallowed his food in great pieces, eating the sinew and fat of the beef, but later placing his powerful talons upon the fish or beef, he would raise his wings, draw his body up from the food, and proceed leisurely to tear it into shreds, feeding as daintily as a squirrel, but leaving all the sinew and fat. The man who captured the eagle said on the ground beneath the nest was the

Photographed from life.

refuse of fish and other prey, making an odor that was far from agreeable.

The strength and beauty of this king of birds grew on us daily, but as he could serve his country better as a mascot for the army we parted with him, but the memory of his departure is still fresh, recalling a picture full of pathos. It was night, and the eagle had been put into a box for shipment; the wagon stood waiting; as it moved off the caged bird peered out, and that last lingering look from his eye expressed rebuke, sorrow and longing; he gave forth a low gurgling note, as if pleading to be allowed to remain; he left a woman standing by the gate with tear-bedimmed eyes and a strangely pulsing heart, but he taught us that the more we study these creatures, less Godlike than ourselves, the more we feel an indulgent care and kindly sympathy for them.

KISSIMMEE, Fla.

A Scottish Stag.

MR. WALTER WINANS has sent to the FOREST AND STREAM from England a New Year's card which is an engraving of a spirited painting by him of a scene in the deer forests of Scotland; and we have reproduced it here.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Bears Born in Captivity.

In the Philadelphia Zoo.

Editor Forest and Stream:

Bears so seldom breed in captivity that it may interest you to reproduce the photograph which I send you, if it is clear enough for the purpose. The cub was one of a litter of four, bred from a pair of brown bears (*Ursus arctos*) from Russia, which have been in the garden for seven years; they were born early in the morning of Jan. 19, three being dead when first seen by the keeper, all of them having been much torn, apparently by the mother. Some little life being left in the fourth, it was removed and an attempt was made to bring it up on the bottle, but it died at the end of thirty-six hours. It was photographed, while living, by Mr. Carson. The cub was 7½ in. long and weighed 12¾ oz. The body was covered with fine, short, grayish hairs, and had on each shoulder (as seen in the picture) a triangular white patch, these being connected by a white bar between the upper anterior corners, forming a half-collar. Two of the other cubs were without the white markings, while the fourth was too much mutilated to draw any conclusion from. Its presence in the one specimen is interesting, as these marks are known to occur sometimes on older animals of this species. *Ursus collaris*, F. Cuvier, from Siberia, was founded upon such specimens, and they are referred to as occurring in Japan, by Temminck, in the "Fauna Japonica," in speaking of his *Ursus ferox*; both of these alleged species being forms of *Arctos*.

The number of cubs in the litter appears to be unusually large. We do not know very much with exactness upon this point, but it seems to be generally assumed that two is the normal number, and personally I have never seen signs of more than this number, accompanying the mother at one time, among our American species.

It would be interesting to get some information on this subject from your correspondents.

ARTHUR ERWIN BROWN.

PHILADELPHIA ZOOLOGICAL GARDEN, Jan. 27.

In the Brooklyn Zoo.

About ten days ago, Sallie, a black bear in the Prospect Park Zoological Gardens, in Brooklyn, N. Y., gave birth to a litter of cubs. Edward Walsh, one of the keepers, informed a FOREST AND STREAM representative who called to inquire about the new arrivals that it had not yet been definitely determined whether there were three or four cubs. The mother has a good disposition, and the cubs have been seen repeatedly by the keepers, who enter the inclosure to feed the bears, but there has been no opportunity as yet to determine the exact number of cubs. It is certain, however, that there are at least three.

The cubs are healthy and doing well. The mother seems to spend most of her time suckling them, and is very solicitous for their comfort. The cubs have a habit of whining like puppy dogs, especially when by any chance they are crowded away from their dinner. Their mother licks them and fondles them with her paws and is as proud of them and jealous of interference as any human mother.

At birth the cubs were steel gray, and about the size of kittens. No white markings were noticed on their bodies. The exact time of their arrival is not known. For two or three days the mother bear had not been seen, but this attracted no particular attention, as the bears often lie in their dens several days at a time in cold weather.

It was not till the young bears were heard whining that the real state of affairs was known.

The father of the cubs is a bear called Peter. Peter has for company, besides Sallie, two other female bears, Lilly and Mary Ann. The four bears get along well together, and no one of them has attempted to interfere with Sallie's family. Each of the four has a separate den half filled with straw, and at this time of year much of their time is spent inside. There is a possibility that Mary Ann may go to housekeeping before long.

Sallie's cubs are the first ever born at the Park. It was thought last year that the bears had mated, but there was no result. The season, according to Mr. Walsh, is the last of July and first of August. This would make the period of gestation about five months.

The conditions at Prospect Park are very similar to those to which bears are accustomed in a wild state, and differ chiefly in the fact that the animals receive food throughout the winter. Strictly speaking, the bears do not hibernate. A good deal of their time is passed in sleep, but it is not uncommon to see them out on the coldest days, and they will break ¾ in. of ice to get drinking water from their trough.

Snakes Swallow their Young.

BROOKLYN, N. Y., Jan. 27.—Editor Forest and Stream: I take your valuable paper from my newsdealer, and seeing in FOREST AND STREAM an article entitled "Snakes Swallow their Young," I shall be pleased if the information herein contained will aid in strengthening the statements made by Col. Nicholas Pike, whose letter was enclosed to you by Señor X., of Pasadena, Cal., under cover of Dec. 17.

In 1886 I had the pleasure of witnessing such a performance, in a swamp about three miles from where I then resided. There were a male and female garter snake, and as I came upon them I made a slight noise, when, as Col. Pike states, the female placed her head flat to the ground, made a peculiar noise, and four of her offspring crawled down her esophagus. The male ran away without my noting his actions. I was very greatly surprised at the time, never having seen it before, and on killing the female, to make sure that my eyes had not deceived me, I was enabled and did secure from her gullet the four offspring.

On going in the direction in which the male had run, I came across him about 20 ft. away, with three more young ones, and killed him, in order to ascertain whether he also had swallowed his progeny. He had not, however, as subsequent dissection showed, and I have since been sorry that I did not spare his life and make a noise in order to see the result.

Game Bag and Gun.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

Red-Letter Days.—I.

In sporting life, as in your every experience, there is marked contrast between blank days and red-letter days. You earnestly desire the former to remain blank in your mind. You neither wish to think or speak of them. Your greatest enemy cannot paint them any blacker than they really are. Not so red-letter days. They may not be the days on which you have had your best shoot or your biggest bag, but they are clearly marked in memory dear, and remain with you so long as life lasts.

It is true, the ever present critic, whose task at times is easy, his labor light, may accuse you, when your rod has been put to the test, of telling fishy stories. He may assert, with confidence, that the 35lb. salmon you love to talk about—it's your pet story—really, when held up on the river bank in your patent scales, weighed but 25lbs. He threatens to turn on the gramophone in proof of this, giving with accuracy the story as you first told it.

When you wish to decide a natural history question and state positively that you have seen a moose eat grass, he is equally positive that it must have been an optical delusion—what you saw must have occurred in the late evening; or your distance from the moose must have been great—you cannot produce a piece of the grass at

denizen of the wilds far behind. The country became wild in the extreme—hill and dale, bits of heather on the high lands, with frequent ravines leading to morass or bog. I followed one of these ravines that led me to ideal snipe ground. Into this I boldly stepped, as if I owned the whole country. Here we are! with all that can be desired, on a perfect day for snipe shooting. Down wind I worked with steady pace, and here! yes, here! is snipe No. 1. Up he gets, at no great distance, with his weird sounding note of alarm, and round he comes, as I expected, to the wind. He is speedily cut down. No aiming above, aiming in front, or bringing round the gun, according to hints frequently given as to how to kill snipe. (Practice, not theory, is required.) Snipe No. 1 is simply cut down without aiming, with No. 12 bore, No. 8 shot, without the aid of choke-bore or smokeless powder, unknown in those days. With what satisfaction you gaze on the quarry, this unexpected treasure, as he lies on his back on the sedge grass, while you reload. But off again; my eye is surely in! No. 2 snipe is soon found, and accounted for in a similar manner, followed by such sport, as the day wore on, as I had not before, and have not since, experienced. Suffice it to say, that long before the time of departure of the evening train I had exhausted my ammunition, having had happily but few misses, and I had more than filled my bag with fine specimens of the English snipe.

I may add that day after day and week after week I kept the station mess supplied with snipe from a quarter unknown to my comrades, except to one favored friend, who shared my sport, my joys and sorrows, and who, like myself, in moments of reflection delights to hark back to these red-letter days with snipe in South Wales.

MR. CHAS. F. RIORDAN'S CARIBOU.

a moment's notice; you cannot have your kodak always at your side; you cannot at all times give proof positive of the accuracy of your statements.

I doubt whether the enemy, if there be such, or the critic, will object, now that we have arrived at the close season, and some days must necessarily be blank, if an old sportsman digs somewhat deep to unearth a few reminiscences of what remain clearly cut in his mind as red-letter days with rod and gun, at both sides of the Atlantic.

To begin with the gun, at t'other side of the pond.

It is, alas, many years ago since, as a young sub of a marching regiment, found myself stationed during the shooting season in a somewhat remote town in South Wales. I had come from a land of sport, where hand and eye were kept in constant practice, and I flattered myself that I had acquired the knack in that best of sport—snipe shooting.

Imagine my disgust on being told that no shooting was to be had for love in this abode of Taffy, and unless you had a well-filled purse and lots of money, you could not get a permit to shoot pheasants in the few preserved spots in the neighborhood. This I could neither afford nor appreciate, and besides, being a lover of the long-bill, I was bound to leave no stone unturned to find even that historic one little pet jacksnipe which, when you have shot, after many a try puts an end to the sport of the place.

Educated professionally in the making and reading of maps, I procured an excellent ordnance survey contour map of the county (Pembrokeshire), and this I eagerly scanned, finding that the distant part of the county abounded in swamp and morass.

How speedily was the well-tested gun produced, and soon an early morning train conveyed me to a small station in the midst of the bit of country I had selected from my map scrutiny as likely to hold my favorite snipe—common or full English snipe. Here I was dumped on an unattractive spot; no swell dog cart, with a high-stepping thoroughbred and a neat groom wearing a cockade met me; no country squire to ask me to lunch; no keeper of game, with hat in hand, to welcome me, and receive the inevitable tip on my departure. A country bumpkin or two seemed to have a mortgage on the railway station and its surroundings. This gentleman put the straight question: "Master, what be you a looking for?" An evasive answer from me: "Oh, a mere matter of seeking fresh air," settled his mind, and enabled him to return to his remunerative occupation—loafing.

Soon I decided how best, down wind, to work the country; no pointer, setter or spaniel is here required—only the knowledge of the country and how to work it. Soon I had left the railway station and the inquisitive

It may be necessary to state that the geographical position of our happy hunting grounds—the wilds of Macloclog—remains unchanged. Time, however, with its over-civilization, has done much to spoil sport in this region. But even now, having secured a permit from the squire, and duly tipped the keeper, a fair bag can be secured.

FREDERICTON, N. B.

MIC MAC.

Adirondack Guides' Association.

SARANAC LAKE, N. Y., Jan. 26.—*Editor Forest and Stream:* The sixth annual convention of Adirondack Guides and Foresters was held in this village on Wednesday evening, Jan. 25, 1899, at the opera house.

About 400 persons were present, including women and children, and guides from nearly every section of the Adirondack wilderness were in attendance. Among the associate members are over 100 sportsmen, patrons of the guides, representing many of the largest cities and towns of the United States. The speakers included the Rev. H. Ward Denys, of New York, the Rev. H. D. Corkran, Prof. J. E. Weld, while others of the associate members made brief addresses.

In the absence of the president, Attorney J. C. Little acted as chairman of the meeting. The association favored thirty days of hounding, and preferred the month of October as the best time for hounding to be allowed. The following resolution was passed:

Whereas, There is a vast number of violations of the fish and game laws throughout the Adirondacks each year, the knowledge of which almost invariably comes to some member of this association, but does not, apparently, reach the proper authorities; and

Whereas, It is not practical for the members of this association to report such depredations unless clothed with the proper authority, and in the pursuance of duty; and

Whereas, The Adirondack Guides' Association numbers among its members some of the best guides in the State, each of whom is bound by oath to obey the game laws of the State, and who are, by reason of their long experience and intimate knowledge of the forests, better qualified than any others to serve as game wardens; and

Whereas, The forests need to be patrolled frequently during much of the year, and especially during the fishing and hunting seasons, to prevent constant infringements of the fish and game laws; therefore

Resolved, That it is the sense of this association, and we do hereby petition the Legislature to enact a law appropriating a sum of money sufficient to engage a number of men, to be appointed from the membership of

the Adirondack Guides' Association, at a nominal salary, to act as game wardens, and patrol certain sections of the Adirondacks throughout the year for the purpose of preventing, as much as possible, depredations of the fish and game laws, and bringing offenders of the same to justice. (As a witness to any charge made by a game warden is necessary, two men should be appointed in each section.)

A motion was carried amending the by-laws so that the executive committee may be composed of guides of ten years' standing, instead of twenty years.

The annual address from the honorary president, Hon. Verplanck Colvin, Albany, was then received and was listened to with close attention, and warmly applauded. The address was as follows:

"STATE OF NEW YORK, Office of State Land Survey, Albany, N. Y., Jan. 23.—To the Members of the Adirondack Guides' Association, Saranac Lake, N. Y.: Gentlemen—I have received your polite invitation to the annual convention of the Adirondack Woodsmen, to be held on the 25th inst., and for a few days had hoped that it might be possible for me to be present. These meetings are, however, held at a period which is for me a very busy season of the year, when many official duties require attention, so that I must avail myself of the kind alternative offered by your secretary and send you in writing the remarks which it would give me great pleasure to be present to address to you personally.

"The year 1898 has stamped its figures like a symbol upon the pages of history as the beginning of a new epoch for our nation, and the deep vibrations of that momentous year are still felt, even in the remote hamlets of our Northern wilderness.

"Before the snows had disappeared from the Adirondack peaks, or the ice from the Upper Lakes, our country was suddenly and unexpectedly involved in a war which reached east and west to the antipodes, and the intrigues of Spanish strategists threatened to involve our country in a war with Germany, France, Italy and Australia; in which event, our long and exposed coast lines, extending both on the Atlantic and Pacific, from Arctic ice to the region of tropical and semi-tropical vegetation, would have been open to numerous attacks by powerful enemies, and the destruction of cities and villages, and the ruin of trade and commerce, with all those horrors which follow a great and terrible war.

"When your organization was formed, you asked me to act as your honorary president, to suggest to you from time to time such things as might be useful to the woodsmen of your section of the State, and advantageous for the interests of our forests. I accepted your invitation on one condition: that in time of war you woodsmen and riflemen of northern New York would form a regiment for the national defense. This you gladly agreed to do, and at different times, since the organization of your society, on your behalf and on behalf of many of those who are interested in military life, I have presented to the Adjutant General and to the State authorities your request for military enrollment of such a number of your men as may be found qualified to form a detached company or companies of the National Guard.

"I first urged the importance of this organization upon the late Adjutant General Porter, the guides at Saranac Lake having offered their services for the formation of a company of National Guard. Gen. Porter talked very frankly and freely with me of the National Guard, and spoke highly of the personnel of the men who would form such a company, but stated that the means at his disposal would not permit him to organize the same. I subsequently renewed this request at different times, but met with very little encouragement from the authorities.

"When the war with Spain broke out and the possibilities of an attack upon this country by great allied forces were considered, the importance and value of such organizations as your own became immediately apparent; and with the consent of many of your leaders, made in writing, I again tendered your services as a corps of Minute Men and Riflemen, together with a tender of services of those of this department who had signed an offer to the Adjutant General of this State, by letter dated April 20, 1898, and received from the Adjutant General the following reply:

"Adjutant General's Office, Albany, N. Y., April 21, 1898.—Hon. Verplanck Colvin, Albany, N. Y.: Sir—Your patriotic tender of services has been received and placed on file. Should occasion arise it will be presented to the Governor for his action. If favorable every facility will be given you for enlisting properly the men you name.

"I appreciate your offer of the services of the men from your department, and should the occasion arise, will advise you. Respectfully,

C. Whitney Tillinghast, Adjutant General.

"In order that you should be in readiness in case a call should be made for your services, I sent out to the various vice-presidents of your organization, and others who had tendered their services in writing, enrollment papers for signatures by men willing to join the proposed regiment; and with but few exceptions received a ready and favorable response, so that in a short time I was assured that one of the best and strongest bodies of men that could be secured, and unquestionably the best body of sharpshooters and riflemen which the United States could offer, were gathering to hold themselves in readiness to respond when called for by the Governor of our State or the President of the United States.

"I wish that time and space permitted the transmittal of the earnest patriotic letters, and the tender of services in this regiment made to me by the men of northern New York. Every county offered its quota, though the enlistments were to be limited to the most skilled marksmen, and men injured by hardships and fitted by long service in camp, in forest and field, to military service.

"I regret to say that, though the services of this organization were repeatedly offered to the State authorities, their acceptance was given again and again deferred, until on June 6 I received orders from the highest military authority in the State not to take any further active steps in the matter of this organization until further notice. Previously I had received from the Governor of this State an assurance that in case any single volunteer regiment should be accepted, your regiment should receive the first consideration.

"But the enlistments which were made, both previously and subsequently, were restricted to the existing militia regiments and to enlistments in the regular army; and at no time, I am informed, was any volunteer regiment permitted to be organized in this State such as you desire.

"In one month the crisis of the war was practically passed. The glorious victories of our navy at Manila and Santiago, followed by the splendid victory at San Juan Hill, and the surrender of the city and province of Santiago to our land forces, rendered a further increase of the military arm apparently unnecessary, for the war was undoubtedly at its close.

"Since then I wish to say to you I have received a letter which says: 'I wish that I had had your regiment down alongside of me at Santiago,' signed 'Theodore Roosevelt,' and I have since said to Governor Roosevelt that if you had been down there you would not only have stood by him shoulder to shoulder in that desperate fight, but your sure rifles would have done great service for your country, and your axes would have cleared roads and built causeways and bridges for the troops and provision trains, and your strong arms and tender care would have saved many valuable lives, and have brought added glory to the Empire State.

"The lessons of this war are not void of importance to you woodsmen, as well as to the dwellers in the cities and country, and I think you as citizens have a right to criticize the military system which, in times of national peril, makes it a privilege of a class to receive permission to defend the country, and that those who are filled with patriotic fervor, and who are qualified by experience in camp life, and wonderfully skilled as marksmen should receive the consideration due to them as an organization to which they are entitled, is a matter which deserves your serious attention. Further than this, as civilians, we have all of us a right to ask whether in time of war military employment is to belong solely to those who by accident or circumstances happen at that time to be in the militia service of the State; for it is not to be credited for a moment that other citizens are not equally patriotic, equally brave, and as devoted to the interests of their country as any militia officer or private.

"I do not forget, nor do I wish to depreciate in the slightest degree, the value of military training for military service; but I as a citizen of a republic, which is based upon its civil institutions as the foundation of its freedom and safety, insist that no military aristocracy shall be permitted, either now or in the future to obtain an absolute control over the organization of troops for national defense. When specially qualified civilians desire to offer their services to the State for military duty, the military code of this State should be so amended as to provide for the

employment of such men in the form of a new organization, so that neighbors who have stood shoulder to shoulder for years may be permitted to stand shoulder to shoulder again on the field of battle. They should not be scattered through various commands, with their special abilities for such service lost, or to a great degree effaced by being mingled with others unaccustomed to such service.

"I hope that these experiences may lead our State Government to grant to northern New York at least one separate company composed of guides and foresters from among your organization who desire to drill and acquaint themselves with military methods, and also provide for even smaller units of military organization under the control of non-commissioned officers in villages and hamlets, so that the elementary training necessary to the soldier may be kept up in your midst, and the cry not raised that such men, with such strength and with such skill with the rifle lack knowledge of tactics and discipline," and that, should occasion ever again arise, you may be enabled to form the regiments which you desire, and show what you can accomplish.

"Turning from these questions, which now belong to history, to your present and immediate interests in the protection of the forests and the preservation of the fish and game, I do not find any new suggestions to offer in addition to those made in former years. Fortunately under the recent State administration, the extent of our State forests has been increased, and numerous areas of land hitherto held as preserves and private property are now thrown open to the public. While this policy has been adopted at a very late date, as compared with the period at which I first made these recommendations in reports to the Legislature of our State, yet it is satisfactory to have these steps taken at all, and it is to be hoped that still larger area of private lands may be acquired by the State in the near future, within the forest preserve, without great expense.

"In the matter of game laws, important amendments have been proposed in the present Legislature which will excite your keenest interest. But as these measures have not yet been reported from the committee in charge, it may be premature to discuss them at this time.

"You will I know pardon me if I again urge upon your attention the importance of preserving to the greatest extent possible all the varieties of wild animal life existing in our forests, as these are among the chiefest attractions which bring people from great distances into this State. While skillful marksmanship requires of the rifleman constant practice, it is believed that this practice can be had upon inanimate objects, movable targets, or projectiles thrown from traps; and it is greatly to be hoped that the slaughter of harmless beasts and beautiful birds may to a large extent be prevented.

"The guides and foresters ought to be the true preservers of the game of the wilderness which they love; for upon the existence of this very game depends very largely the business of the country and the prosperity of those inhabitants—not by taking the lives of these harmless creatures when they are not needed for food or for their peltry—but by preserving them, so that the student of natural history, the traveler, and all those who are attracted by the charm of the woods and waters, the mountains and forests, may find them to be exactly as described, abounding in wild game and beautiful in their rich and abundant animal life, as they are great and glorious in their magnificent forest.

"Wishing you one and all prosperity and happiness, and regretting that my duties here will not permit me to be present, I remain, very truly yours,
"VERFLANCK COLVIN."

The Rev. H. Ward Denys, of New York, was then introduced. Mr. Denys told of some very interesting experiences of his with friends in Switzerland, and how on two occasions he was lost on the Alps, and would undoubtedly have perished had it not been for the guides which were in the party, and from which he had strayed. He explained how important the occupation of a guide is, and how essential that they should know the country well, and should always bear such a character that tourists and sportsmen might feel perfect safety in placing themselves under their protection. He said he was glad to learn that among the objects of the association were the protection and preservation of the beautiful forests, the fish and the game, as upon these depends unquestionably not only the livelihood of the residents of the Adirondacks, but also the lives of thousands of persons from all over the world, annually. He was particularly pleased that they also advocated the promotion of temperance among members of the association. Mr. Denys spoke twenty minutes, and was several times heartily applauded.

Following Mr. Denys was Prof. J. E. Weld, who spoke in a facetious manner, telling funny experiences of his own when in the woods, producing much merriment. He mentioned the fact that in traveling through the forest in company with his guide and rifle he had been enabled to fully regain his health, furnished him much sport, and hadn't hurt much of anything. His happy, cordial manner pleased the large party of woodsmen, and they cheered him frequently.

The Rev. H. D. Corkran, of Delaware, was next introduced, and talked in a particularly interesting style. He compared this mountainous country with the Delaware territory, and felt that the guides were indeed blessed in being permitted in this glorious country, amid such healthful surroundings and grand scenery. He said his fishing experiences had taken place principally upon the ocean, and contrasted the sport there with that of the Adirondacks. The crowd evidently enjoyed his remarks exceedingly and applauded him warmly.

The secretary's report, calling attention to some vital matters, was then read, and was as follows:

"Mr. President, Gentlemen of the Association: In making my annual report, I regret to state that during the past year there has been a decided falling off in the list of active members, owing principally to the fact that a separate guides' association has been formed in the Fulton Chain district on the John Brown's tract, in Herkimer county. The men there felt that they were too far from the head office, and did not receive the benefits shared by other members in other parts of the Adirondacks. I am fully convinced that this is an error in judgment, and sincerely believe that the greatest good to the greatest number can be obtained only by all the guides of the Adirondacks working in unison. By so doing, we men of the North Woods also become better acquainted with one another, and much unfriendly opposition and strife are thus likely to be avoided. I therefore strongly recommend that every really good guide of the Adirondacks be urged to come into the association and to join with us in our endeavor to preserve the woods and water, the game and fish of the Adirondacks, and to protect the tourist and sportsman against the imposition of unworthy and incompetent men, who falsely call themselves guides.

"There was a balance of \$259.06 in the treasury at the last annual meeting, and we have received from fees and dues during the past year \$251. The total expense of the year has been \$282.01, the most of which has been for advertising and printing. I believe that each dollar spent in judicious advertising is of far greater benefit to the members of the association than \$2 lying idle in the treasury, and I would favor placing advertisements which shall contain the names and addresses of all the active members in several first-class sporting publications the coming year.

"Through our advertising I have received many letters

from important parties asking for association guides, and in every instance the guides employed have given satisfaction.

"Each guide and associate member should bear in mind that he is in honor bound to assist members of the association to employment in preference to persons who are not members. This is a matter about which there has been some criticism, and, according to our by-laws, any member who violates this rule lays himself liable to expulsion.

"In conclusion, I wish to urge upon the association, for the good of the organization in general and each member in particular, the absolute necessity for doing away with all petty local jealousies and contentions, and the need of a united and combined effort on the part of our members in carrying out the objects for which this association was formed. By accepting cheerfully at all times the decisions of the majority, and by united and harmonious action on the part of every officer and member.

A SCOTTISH STAG.

the workings of this organization may be made to be felt in the Legislature at Albany, and throughout the country, and prove of special value to the Adirondacks region, and particularly to the members of the Adirondack Guides' Association. Respectfully submitted,

"FRED M. SHELTON, Secretary."

After the banquet, which took place in the parlors below, the guides and foresters again assembled in the main hall, and the election of officers for the ensuing year was held. Jonathan J. Broome, of New York City, was elected honorary president; E. E. Sumner, president; Fred M. Sheldon, secretary; Oatman A. Covill, treasurer, and Frank Vosburgh, James Stanton, S. B. Kathan, Douglas Martin, Warren Cole, John Hinkson, Wesley Wood, Lucius Trim, Webster Partlow and E. J. Chase, vice-presidents. The next annual meeting will be held on the evening of the third Wednesday in January, 1900.

SEAEVER A. MILLER.

Protection of Deer in the Adirondacks

Editor Forest and Stream:

In the discussions of the ways and means of protecting the Adirondack deer, which I have read in your columns, no mention has been made of what appears to me to be the chief reason why the game is not more abundant. A great deal has been written in condemnation of night hunting and hounding, and columns in praise of still-hunting have been set before your readers. Everybody seems to be oblivious of the fact that the slaughter which is productive of the greatest evil is that which is carried on by Tom, Dick and Harry, every year during June and July. During those months the deer are not more wild than the domestic sheep in pasture, and they fall an easy prey to the small boy with a rifle, as well as to the gray-headed villain who ought to know better. At that season the deer may be killed by any one, whether he be skilled or unskilled in the hunter's art, by daylight or by jack-light. And the small boy, and the French Canadian, and some Adirondack guides, turn out day after day and night after night to destroy every deer that they can hit with a rifle ball or a charge of buckshot.

Deer ought to be abundant in the Adirondacks, but they will never be abundant so long as this early slaughter goes on unchecked, no matter what laws may be passed to control the operations of the sportsman, who comes late in the year.

The existing laws are openly defied. Either the game wardens are too few in number, or they are neglectful of their duty. Their approach is announced hours before they arrive, and everyone is ready to receive them when they come. Much idle talk threatening the lives of the wardens has been indulged in from time to time. But there is no doubt in my mind that determined and courageous men could enforce the law easily. A few arrests and convictions, and a tolerably close watch upon the country, would soon put an end to nearly all illegal hunting. But I am not very confident that the object may even be attained by means of game wardens appointed from the inhabitants of the woods.

The people think they would be willing to enforce a just game law. During an experience of twelve consecutive years, I have not known a season in the Adirondacks in which the law was respected or enforced. The temptation to kill deer, in or out of season, is too strong for those people; and even though they know that destruction of the game supply means a harder winter for themselves and their families, many men, whose chief revenue comes from guiding, will kill deer recklessly, and encourage others to do the same. Since the present law was passed, the inhabitants of the Adirondacks appear to have lost their power of reasoning when protection of deer is under consideration. In evidence of which stands the fact that everybody seems possessed to wantonly destroy every deer in the woods. Men who had not hunted for years have made war upon the game because they were angered by the game law. Such a state of mind is not rational, of course; but that it exists any

one may discover in a few minutes' conversation with any of the inhabitants of the woods.

I, for one, do not believe that the solution of the problem lies in still further restricting the sportsman. Early hunting and night hunting should be stopped with an iron hand. Hunting from Sept. 1 until Nov. 1, with or without dogs, ought to be permitted. It is foolish to suppose that one can still-hunt on the track during September and early October, in the Adirondack forests. For my part, I do not see anything disgraceful in hounding the deer. I enjoy the working of the dogs. I like to hear the race over hill and through valley. It seems to me sportsmanlike to pit the instinct of the hound against that of the deer; and the result is always interesting. You, who have hunted the deer much with hounds, know that the advantage is largely in favor of the deer. The great majority of them escape. And when the deer does come in sight of the watcher on the lake shore, it is not always easy, or even possible, to kill the game. Those who have not tried the trick do not know how difficult it may be. If you are hunting on a shallow river, the game must be killed, as a rule, while it is on the run. No one will deny that it is sportsmanlike to kill a running deer with a rifle ball. To many of my friends the hounds are the principal feature of the chase. Naturally, every hunter is pleased with a shot that brings down a noble buck. But what is the chief topic of conversation at the camp, morning, noon and night? It is the story of the dogs, always the exploits of the dogs. And do you not think it a pity to remove forever from the hunter's camp the old hound dog, whose sagacity has served to charm away many a happy hour in the forest? I do.

J. H. WOODWARD.

NEW YORK CITY

Maryland Association.

BALTIMORE, Md., Jan. 25.—*Editor Forest and Stream:* I herewith send you a clipping from the Baltimore Sun of this date, giving an account of the annual meeting of the Game Association held last night. You will note from the report that our Association is prosperous and active. The game warden reports that about 300 arrests were made by his deputies through the State during the past year, and that he has secured convictions in about 97 per cent. of the cases.

GEO. DOBBIN PENNIMAN,
President of the Maryland State Game and Fish Protective Association.

The annual meeting and election of officers of the Maryland Game and Fish Protective Association was held last night at the Carrollton Hotel, President George Dobbin Penniman presiding. Considering the inclemency of the weather, the meeting was well attended. The officers made their annual reports; resolutions were passed thanking Governor Lloyd Lowndes for his co-operation in the work of the Association, commending Senator Hoar for his bill to forbid the importation of the feathers of song birds, and a number of interesting matters were discussed by the members.

President Penniman's Address.

Mr. George Dobbin Penniman, the president of the Association, in calling the meeting to order said the meeting marked the close of the fourth year of the Association, which is prosperous and holds its own in membership. He referred to the labors of the first three months of the year, when its officers were endeavoring to obtain the passage of the general fish and game bill. The fish bill passed the Senate, but failed by one day in passing the House. It was killed with many other bills by the quarrel over police reorganization and other political measures. The effect of the free discussion of the bill in the Legislature was of great value, said President Penniman, as many of the suggestions contained in it were passed as local measures.

Referring to the game bill, he said: "It has made it unlawful to sell game in Baltimore during the closed season, even if the game was killed outside of the State. The Maryland birds are not now, therefore, illegally killed by market gunners and smuggled into the city to be sold as foreign-killed birds. The act has made it unlawful to use big guns anywhere in Maryland waters, to shoot ducks at night, to wilfully disturb ducks on their feeding grounds, to hunt rabbits with ferrets, to destroy pheasants and other game birds with poison, and it also protects insectivorous birds. It properly divides the State into districts, giving to the counties in each district similar closed seasons, and I have no doubt that at the next session of the Legislature many of the counties now out will accept the seasons given by the bill and will put themselves fully under its provisions."

Mr. Penniman referred to the loss the Association had suffered in the death of Dr. George W. Massamore, the late assistant game warden, who was so zealous in game protection and fish propagation.

After stating that the Association owes much to State's Attorney Duffy, who has prosecuted all game cases vigorously, Mr. Penniman said he had every reason to feel sure that the constitutionality of the law will be sustained. He commended Game Warden Gilbert and the work of the fish commissioners, and said: "Mr. George, who has charge of the Druid Hill Park hatchery, has trebled the number of young trout annually distributed through the trout streams of the State. This Association has procured many thousands of trout from him, and has placed them in the streams near Baltimore. Several million of young perch have been placed in Back, Middle and Gunpowder rivers. Mr. George has begun the artificial propagation of black bass at the park, and if the experiment is successful the rivers of the State will soon furnish good bass fishing."

Warden Gilbert's Report.

State Game Warden R. H. Gilbert reviewed the work of himself and his deputies during the year. He stated that there were now 220 deputy game wardens in the State actively engaged in enforcing the game laws, and that their enforcement had been much more rigid and the results more gratifying than ever before. He reported also that upward of 300 arrests for violations of the game laws had been made in the last year, and that 97

per cent. of them had resulted in convictions. The election of officers resulted as follows:

President, George Dobbin Penniman; Vice-President, J. Olney Norris; Secretary-Treasurer, F. C. Kirkwood; Executive Committee, F. C. Latrobe, James Scott, L. M. Levering, William H. Fisher, Thomas C. Clark, M. H. Ould, William H. Armstrong, of Hagerstown, Md.; A. E. Thomsen, R. F. Kimball, Wm. H. DeCourcy Wright, Dr. Samuel C. Pennington, J. L. Strouss, DeCourcy W. Thoin, Henry Brauns, Dr. Charles C. Harris. All the foregoing were re-elected except Vice-President Norris and Messrs. Clark, Armstrong, Thomsen, Wright and Pennington, of the executive committee.

A resolution, introduced by Mr. DeCourcy Thom, was passed thanking Governor Lowndes "for his great assistance to the Association in appointing numerous deputy game wardens throughout the State at the instance of the game warden and in further recognition of the excellent work done by the fish commissioners under his supervision, which has trebled the number of young fish annually hatched at the State hatcheries for Maryland waters." The resolution also states that Governor Lowndes' support given to the State game warden and the fish commissioners had made the strict enforcement of the game laws possible.

Women, Weeds and Insects.

The resolution introduced by Mr. William H. Armstrong, of Hagerstown, and passed, was as follows:

"Resolved, That the introduction in the Congress of the United States of a bill for the protection of song and insectivorous birds by Senator Hoar makes him the compeer of Sir John Lubbock, the eminent English statesman and humanitarian."

"That a crisis now exists with the bird creation because some of the most faithful species have been nearly exterminated."

"That women, weed seeds and noxious insects seem to have confederated to ruin agriculture, to destroy the economy of nature and aggravate the curse that the farmer 'shall earn his bread by the sweat of his brow.'"

"That the action of Senator Hoar is commended by this Association and is entitled to the moral support of every economist and humane person of the land."

At the request of President Penniman, Mr. J. Olney Norris described the raising of Mongolian pheasants at the Carroll's Island Ducking Club's shore. He said that four hens and one cock were placed in an inclosure, the fence being 16ft. high. The club had fourteen of these inclosures built last season. Sixty-seven per cent. of the eggs had been hatched. When the young pheasants were about half-grown they would fly over the fence and would help to stock the surrounding country with pheasants, the shooting of which was fine sport.

President Penniman stated that he had a plan for distributing these pheasants all over the State. He intended asking large farmers in various parts of Maryland to raise a few of these fine game birds, and then let the birds look out for themselves, and he thought they would soon become well distributed and numerous enough to afford fine sport.

Before adjourning the meeting President Penniman made a personal request to every member that whenever he heard of any restaurant or hotel or dealer selling game out of season that he should at once notify the game warden, who would get a search warrant, and if game was found would have the man arrested.

The Lacey Bill.

NEW HAVEN, Conn., Jan. 26.—*Editor Forest and Stream:* I agree with the statement of Mr. L. A. Childress in your last issue, that the bill now before Congress to enlarge the scope of the Fish Commission to include game bird propagation and distribution deserves a fuller and more careful consideration than the members of either House appear to be disposed to give it. It deserves also more impartial and expert criticism than Mr. Childress has given it.

The introduction of this bill was one of the important events in the history of game protection in this country. The proposal that the national Government shall take a hand in the work of game protection, in which the States have so conspicuously failed, is such an important and promising one that we should not condemn the bill for minor defects, or because it does not suit our own notions of what it ought to be. It certainly has its defects, and its wording is not, to my mind, judicious. Many people may question whether, even if the work is to be taken up, it would be best to put it in charge of the Fish Commission, although this objection does not seem to me of any weight, for there would doubtless be more opposition to the establishment of a new commission, and the work may at any time be transferred to other control if it should seem desirable. Even if no very great good can be accomplished under Mr. Lacey's bill, a proposition to which I do not assent, there is still reason to hope that it will be the entering wedge which will open the way for something better in the future. No time is to be lost in making a beginning; this is a critical period for many of our species, including a number that are valuable as game birds, and the next four years will undoubtedly determine whether they can be preserved or whether they will go the way of the wild pigeon. It is already determined for some of them, I fear. Any measure passed at the present time must be a compromise with the indifference, selfishness and ignorance, born not of blindness, but of unwillingness to see, which characterizes the attitude of the public in general toward these matters, and unfortunately too large a part also of those to whose mercies the inhabitants of the several States are obliged to trust the making and enforcement of the game laws.

The very difficulties which Mr. Childress mentions, which surround any efforts that we can make to increase the game supply, other than by refraining from destroying it, make it important that some systematic work should be done, while the birds are sufficiently plenty so that nature can take care of the details of propagation and distribution. The work of the commission should be directed toward affording nature the best possible opportunities and conditions for doing this. I do not believe that it ever occurred to any one except Mr. Childress that the proposed commission would be expected to apply the

methods of fishculture to propagate and distribute birds. It is certainly much more difficult to introduce new species of birds, or to restore them to a locality that they have once deserted, than it is to do the same with fish, but this is all the more reason that it should be done under the direction of some scientific body, and after proper experimenting, to determine the species and localities which are suitable, and not left to the sporadic attempts of individuals, or of our forty-odd State legislatures, whose expenditures, however, if added together, might represent an expense that would accomplish some work of lasting value if rightly directed.

In providing and protecting suitable breeding places for the birds, a kind of place that is each year becoming harder to find in this country, the commissioners would be as truly helping to propagate them as if they hatched them in an incubator. There is no harm in the bill, because it empowers the commissioners to transport and distribute the birds, although these are matters which the birds are likely to take into their own hands, if we may judge by past experience.

Mr. Childress says: "The people of Texas, moreover, would not care to be taxed for the maintenance of game wardens in New England." When will people begin to realize that the protection of game is not a local matter? In the case of our shore birds and water fowl, in fact in the case of all our migratory birds, and but few of them are not migratory, do not the very same individual birds make up the game supply of every State from Maine to Florida, and from the Northern States of the interior to the Gulf of Mexico? Is it a matter of indifference to the sportsmen of one State that the game is killed off after it has left their territory or before it has a chance to reach them? Can it be argued that the falling off of 75 per cent. or thereabout in the number of migratory game birds in Connecticut, which has taken place during the last few years, is due entirely to Connecticut gunners? Are not the pot-hunters and shooting clubs of the Chesapeake and the Carolina sounds also to blame? And is it a matter of indifference to those interested in the shooting in these favored localities that along a large part of the New England coast shooting is almost a thing of the past, and that many places in the Northern States and in Canada, where the birds formerly bred, are no longer available for them?

Not at all. There is just so much less territory for them to draw birds from, their potential supply of game is just so much lessened, and the number of years that their good shooting is going to last is correspondingly reduced, although, owing to the abundance of game in these places, they do not perceive their loss to the extent that we do in the less favorable places further north.

Mr. Childress tells us positively that no commission is needed, for "a section may be completely stripped of its game birds, yet birds from outlying districts can come in and restock the exhausted section." The same old fallacy. "Sections" do not have game birds of their own except in the case of ruffed grouse and a few other species. Our migratory birds belong to no particular State, no matter what laws human beings may make about them. The birds will and can obey no laws but those of nature. Efforts at game protection must regard these laws and not ignore them. This is why I hope that scientifically directed work will accomplish what the State laws have not done, for the latter have almost invariably been made only with regard to selfish and local interests, and without considering the future.

But the Fish and Game Commission is not intended to supplant the State laws, but to supplement them. One of the ways in which it could be useful would be in discovering and reporting the best means of protection, and what birds are most in need of it, for it is well understood that there are some of our birds that are disappearing much more rapidly than others, and even if these are common or even abundant species the present rate of decrease must soon result in extermination. These are hard subjects to obtain reliable information on, owing to the wide geographical range of our birds, the personal equation entering into all reports upon the abundance or scarcity of game, and the difficulty of getting information up to date, for so fast are our birds going that reports upon the abundance of species four or five years ago may now be entirely misleading. Definite and trustworthy information of this kind would do much to arouse public opinion to favor effective protection before it is too late. Of course, the commission could not compel the passage and enforcement of the necessary laws, but by fixing the responsibility for not doing so on those directly to blame for it, it would make their passage more probable. Because the decrease of game in a certain State is due to excessive shooting in other States is, of course, no real excuse for that State not affording proper protection within its own boundaries, but it is an explanation why it is not done.

It is my own opinion that it would be much better if the protection of all birds except those of comparatively stationary habits, such as the members of the grouse family, could be placed in charge of the United States Government and removed from that of the State Governments who have always shirked the responsibility. What have they done to preserve birds of this class? We can state without fear of exaggeration that at the present rate there will not be one-quarter as many such birds, taking the country as a whole, ten years hence, as there are today, scarce as they have already become. No game laws are successful if they do not keep up the supply of game. At present they are doing nothing more than to somewhat delay the time when most of our species of ducks, geese and shore birds will be entirely gone or nothing more than ornithological curiosities. I think that I have sufficiently stated my reasons, both in this letter and in former communications to this paper, for believing that the Federal Government could do better. I cannot see why the application of the same logic which says that the game that happens to be on a man's land belongs not to him, but to the State, should not apply between the States and the national Government. The State Governments exercise certain rights in regulating railroad fares and charges, yet the national Government has the regulation of interstate commerce. Of course, what is good logic may be very poor law, yet it seems to me that there is something radically wrong if a State that passes and enforces strict game laws can get no redress from another where the game, to which one has no more right than the other,

is killed off without restriction or consideration of the rights of others. There is something wrong if the national Government does not have the power to regulate this.

But to return from these speculations to the practical matter of expense. Of course the Fish and Game Commission has got to spend some money if it is going to do anything. But a thousand dollars spent now will be of more use than many times the amount after the game has practically gone. If we had begun long ago, the money would have been spent to much more advantage than it can now, much land and water suitable for reservations would have cost nothing, but now the Government must pay a good price for it. It will not grow any cheaper for waiting. The sportsmen of this nation want some money spent on game protection, and future generations will have a long score against us if out of stinginess or influence we allow most of our birds to become extinct. Many of them are nearer it than most people suppose. Some of these days we will begin to notice that the long-billed curlew, for instance, has become very rare in certain places where it used to be common. People will say that it is a bad year for birds, or that they have changed their abode and moved to some other part of the country. Then it will be discovered that they have also become rare in all the other places where they used to be found, and that they are practically extinct, and bound to soon become entirely so. Then people will wonder why nothing was done to preserve them.

We want some money spent on game protection. All we ask is that it be spent to the best advantage. Whether spent by the State or by the national Government, it all comes out of the pockets of the people. As I have explained, in protecting the game of one part of the country, a large portion of the rest of it must share in the work and in the benefits resulting from it, if any follow.

It seems to me that a reasonable sum could be placed at the disposal of such a commission as Mr. Lacey's bill provides, with confidence that it would produce good results. At all events I think Mr. Lacey deserves the thanks of every sportsman in the country for his efforts to solve a most difficult problem.

W. G. VAN NAME.

In Missouri.

Having handled yellow pine in a retail way for some years past, naturally I had a yearning to see what a 12in. board looked like when it wasn't a 12in. board; so I climbed into the sleeper of a Memphis-bound train and started for the Current River pineries of southern Missouri. As I drew the curtains of my berth together I thought I heard the porter say, "The next stop is Fort Scott."

Surely this does not look like Fort Scott; big brown hills, covered with scraggy oaks, dotted here and there by a green-topped pine shining in the rays of the morning sun. The trees shower earthward a myriad of sparkling, scintillating atoms of frost, that cover the crisp, fallen, reddish-brown leaves as with a carpet of woven gems, changing yellow clay, black burnt trees, stumps, and forbidden-looking cliffs into a panorama of beauty, a joy and a pleasure to the onlooker from the prairie town of Kansas.

The winding rail fence marking the boundary line between the field and road, covered by a network of brown morning glory vines, screens the deep furrowed track that is seen winding its way up the rough hillside, and is lost to view as it leads to the post-office in the village beyond—where they exchange posts for calico and railroad ties for groceries. Each little town is almost a world of its own, a capital of the parish in which it lies.

Passing great piles of dirty oak posts and freshly hewn ties, you see a hamlet wrapped in impenetrable quiet, a Goldsmith's "Deserted Village."

Huge piles of mouldy sawdust, marks of a once prosperous mill, or the broom-corn-like sheds of a long ago planter, stand silent in the sun. Your first idea that it is a beautifully rough country does not leave you, and as one hill steps from behind another, valleys lengthen, lap, until with each other, the first lonesome pine you saw has become a group, and then a forest. You see them now in groups of a half dozen or a hillside full, nodding a friendly greeting to the onrushing train and seemingly smiling with self-commendation as they congratulate each other on being allowed to rear their heads in such lofty eminence, a growing monument to what others might have been.

Reaching the Current River, as we viewed it a few days later, clear, limpid, deceptive, seeming in places but a few inches when it is that many feet in depth, it flows not ripplingly, but aggressively on, an artery to which all streams in that part of Missouri pay tribute. Near the club house, you find a wonderful spring, and as you approach it from below the dip of your oars startles a huge black bass; a flash, a gleam, and he is hidden in some deep pool, or scudding into the shadow of some covered ledge, he lies among the moss that partly clothes the bed of the river with an Axminster of green, so tempting that one almost ventures a wetting to walk thereon. Rowing becomes more difficult, and looking up for the cause, you see a stream rushing in from the left with the speed of a mill race. Deep, blue, intensely cold, it comes surging down. In summer it is almost hid by the mist. Dipping your hand into the current on the left, you withdraw it almost numbed with cold, while the water on the right of the boat, the river, is warm and pleasant. You leave your boat because you want to go on, not back, where the fierce current forces you.

After walking a quarter of a mile along a river fully 60ft. wide, 4 to 15ft. deep, flowing at four miles an hour, clear and pure, you see bursting from the foot of the mountain a seething, boiling body of water fully 30ft. across. A stone thrown in with the full force of the arm is tossed out, hardly penetrating the water. You stand in speechless wonderment. The roar is so great that long since you have been unable to hear your nearest companion.

A few miles below is a model sawmill town of 1,500 people, the home of the lumber company. Nestling in this little vale are comfortable one and two story houses, a large, well-appointed hotel, which would be a credit to three-fourths of the towns in Kansas. It, as well as every other building in the town, excepting the depot, is

owned by this company and is leased and occupied by their employees. Good sidewalks, clean streets, a fire department and system of water works are here. No intoxicating liquors or cigarettes are sold. All are happy, for all are employed. The Mayor, Council and upper house are all embodied in one person, J. B. White, general manager. It is certainly an ideal municipality. Mr. White, by decision, firmness and kindness, has raised the standard of a mill town's morality until, as Caesar's wife should have been, it is above suspicion. Should a difference of importance arise between employees, Mr. White handles the matter in a manner which results in exact justice to the disputants. From this decision there is no appeal—this edict once set forth is established law. He is unquestionably an intellectual giant with the delicate sensibilities of a woman.

As to the mills, the amount they cut, etc., that is a matter of common statistics. Their workings, being so perfect, the best description is the shortest. A tree starts in one side and comes out on the other almost a house with a family living in it. I had hardly gone to bed, it seemed, when I heard a great, deep whistle, that fairly made the house shake. A few minutes after, looking out the window of my room, I thought myself enchanted. A regular will-o'-the-wisp panorama met my gaze. I rubbed my eyes to see if I was awake. Yet, there they were, bobbing here, there, singly, twos, threes, or more, seemingly a thousand lightning bugs at an early morning revival—in fact, about six hundred lanterns lighting the mill men to their work. Soon the hum-m-m of the saws wooed me to sleep again, and as I somewhat bashfully stepped into the deserted dining room at about half past seven, by way of a pleasantry I inquired of the waiter girl how late I could get breakfast, and was naively answered by the aforementioned lady that I could get it as early as 5. My meal was eaten in silence. Buying all the lumber—not that they had, but that we could pay for—I started hunting for Joe Bernardin's tame turkeys. The cut of the saws called us further into the woods, where we watched the pines come crashing down, then saw them cut into logs, ready for loading. Some time since, wanting a few 6x8x28, the reply was, "we book the order and have ordered the logs cut for these special lengths." Soon after these timbers were sills in a Kansas house, that just ten days before were standing homes for squirrels.

Quails were plentiful, and we had several days' splendid sport; the old fields between the mountains are filled with them, and as they scatter and alight with a whirl on the hillsides, the dogs mark them down. Soon the old gray fellow has them located, becomes staunch, the others back him, a person's liking grows into absolute love as they all four center on the covey, heads up, tails extended, one foot raised, eyes glowing like coals. The nose, slightly twitching, pointing at the covered birds, is the only evidence of life. In a moment, with a rush of wings, they are off; as our guns crack, each dog, if we are lucky, comes laughing back with a quail in his mouth, and oftentimes finding a hidden one, with the dead bird still in his mouth he makes another stand that causes your blood to surge with the supreme enjoyment of the moment. The other dogs, seeing him pointing, back him up, and there you have them a few feet apart, all standing as a sort of a compliment to the first dog's intelligence. The old native we took dinner with that day had the usual quota of lean, lank, hungry hounds of the red, yellow, brown and pepper-and-salt varieties. Our setters got into a bunch, faced out, and with angry whines plainly showed their disapproval of native familiarity. It was funny to see the yelping pack go circling around the setters in almost battle array, snapping and snarling until the owner dispersed them with the kindly aid of some stovewood.

This house was really aristocratic. It had a floor that was mill-sawed, windows, doors with latches, the usual 4ft. fireplace, with a cannon axle across the top, supporting the rock of which the chimney was made. The dinner was corn pone, wild honey and overland trout (bacon), with boiled turnips for dessert.

After the dinner the spinning wheel was put in motion. The old lady would take a string of wool, fasten it to the spindle, give the wheel a whirl, hustle back a few steps as she drew the yarn out, then shuffle forward, spit snuff into the fireplace as the yarn wound itself into a ball, all the while droning a mournful sort of a chant, keeping time as an accompaniment to the rasp-like voice of her assistant. Both work about three days for a dollar's worth of yarn. Every house has the largest deer hide, and they recount with a glow of satisfaction how they killed "that air" buck. The regular Missouri chair, hickory back and rounds, and untanned deer hide bottom, was there. The seeds for spring planting were suspended from the ceiling in dirty, fly-specked sacks, and are the only household ornaments, excepting the photograph of the family group.

Our driver had taken Joe Bernardin, Charlie Carter, Jim Lane and W. Eddy Barnes out quail hunting a few days before. They hunted two days. "Did they kill any quail?" we asked. "They said they killed five, but I did not see any," was the answer. "Sometimes the flocks were so large that they obscured the sun for a moment when they flew up," he continued. The next day they were hunting turkeys. Bernardin and Carter were walking along an old tram, when Carter pointed to a large flock of wild turkeys in the edge of the woods and told Bernardin to shoot. "Oh, no," says Joe, "you don't get me to shoot some farmer's turkeys." In a moment they had flown.

Sturdy, thorough sportsman, George Despain, head filer, added greatly to our enjoyment with his hard hunting and keen shooting; and the thoughtful kindness of Chief Clerk Clarence E. Slagle rendered pleasant every moment of our stay.

The scenery is beautiful; clear creeks, deep-running river, big, stately pines crowning the summit of grand old hills. The sides of most of the hills are covered with a curious formation of rock that in the distance looks exactly like a flock of sheep lying down. Snuggled amid the hills are the usual log huts, some with the holes daubed full of mud, others without, and chimneys built on the outside of nothing but sticks and mud. Generally it is a long building, with the family huddled together in one end, the horses or mules in the other, while the open space between serves as a sort of a shelter for chickens, geese and razor-back hogs, whose incessant snuffling and

grunting would make a deaf man congratulate himself on his misfortune.

A person who sees this for the first time and loves nature forgets the people, and is almost lost in admiration of the grandeur, the magnificence, of the handiwork of the Ruler of the Universe. The towering hills, the beautiful green-topped pines that gently wave to and fro and seemingly bow their heads in reverence to Him who rules all things, make one realize among these hills how infinitely insignificant is man, what pygmies we are, and how, when life goes out, it is no wonder we are not missed.

Our last day's sport was a deer drive, and a great deal of chaffing was indulged in the night before. Warren was master of ceremonies and arranged all the details. We were to be off at 6. The night before you are to get up very early, it invariably happens that something keeps you up later than usual. Our whist game lasted longer than ever that night.

Warren came storming through the halls just as I fell asleep, shouting: "Get up, you lazy devils. It's 8 o'clock and we were to start at 6."

Horace Barnes came into each room singing the reveille:

"Get up, you sons of witches,
And put on your breeches,
And give your poor horses some hay."

At 8 o'clock ten horses stood before the hotel. Old man Hiddlebride was astride a piebald horse, with six deerhounds sprinkled around him on the ground, looking confidently up in his face, barking unitedly. Rand, the other driver, was mounted on a big black mare, and four big, sober hounds stood expectantly ahead in the road.

Parker and Barnes, the traveling salesmen of the lumber company, had good mounts; Warren, head book-keeper, rode a tall claybank; Deacon Jones, salesman, chose the most notoriously rough-riding horse in the county, and we helped him aboard; I got the last horse, a wicked-looking, vicious, but strong pony, which proved the best horse of the bunch before the ride was over.

Ten started, eight "green 'uns," two hunters. As we went galloping off, winding across the ridges of those flinty hills, we looked like a vigilance committee in hot pursuit of a criminal. The wiry little horses fairly made the sparks fly. The pace was a hot one, De Spain leading on his powerful iron gray, and I was "plenty glad" when I reached my stand.

The landlord presented each rider a nice package of lunch, we swung astride our horses, threw the rifles across the pommel of the saddle, and were off on a hard gallop of ten miles to our stands on the river.

The day's sport was that morning's ride. One of the natives, who wanted to be good the evening before, wagered a dollar that some of the party would bring in at least a fawn, basing his hope, I think, on the two old hunters, but just as we were starting I saw him hand over the dollar, saying it was unnecessary to await our return; the sight of those white collars, ties and starched cuffs was enough.

It's shamefully easy to kill a deer on stands. They told us just to stand quietly on the runway, and in a half an hour the hounds would run the deer right to us. The hounds are taken back a mile or two in the woods, put on the track of a deer, and the frightened animal immediately runs to the river, invariably taking a runway. The deer was quickly started, the hounds followed its trail, silence soon brooded over the hills, and one more deer, which "invariably" followed a runway, had crossed the river somewhere else, and ten disappointed souls went home.

FRANK HEDGES.

KANSAS.

The Disappearing Woodcock.

HAMILTON, Ont., Jan. 26.—*Editor Forest and Stream:* Knowing well the great interest your paper has shown in matters pertaining to the preservation, increase or decrease of our game birds, I desire to direct the attention of yourself and readers to the greatly diminished number of woodcock found this season in the Niagara peninsula of Ontario, before and during their fall flight.

In covers which for years have yielded fair bags not more than a bird or two were found. I have wondered if this has been the experience of sportsmen in the adjoining portions of the United States, especially in those portions directly south of us, and in line of flight. If this has been the case it would be interesting then to find out if this has been the experience in Quebec, New Brunswick, Nova Scotia and the portions of the United States adjoining.

If this scarcity has been local we may believe that some temporary cause has diminished the number; but if common from the seaboard to the western limit of the Great Lakes, we may fear that the belief of many cock shooters that this is "a bird of the past" is but too well founded.

Thirty-five years ago men I have shot with here used to kill between 200 and 300 cocks each season; last year my bag in this neighborhood was eight, and I have been told that I was the only person fortunate enough to secure one. I know full well that in the older settlements the breeding grounds are being continually cut down, but surely others to compensate in some degree are brought in by the opening up of new farming territory.

I fear the cause lies in over-shooting. In Ontario the cocks are well protected, as the open season does not commence till Sept. 15, when the birds are moulting and scattered, and most of them have left by Nov. 1; but in the States they are or have been shot from July 4 to May 1—ten months out of the twelve. Ontario early stopped spring shooting, and during the past thirty years has time and again shortened the season, and I feel sure we would agree to stop all cock shooting for some years if our friends across the border would agree to do the same.

OLD READER.

Mr. Riordan's Caribou.

OUR illustration is of Mr. Chas. F. Riordan's thirty-nine point caribou. It was killed by him on Nov. 13, in the northwest Mirimachi country, New Brunswick; in the barrens between the north branch of the Seville and the headwaters of the Northwest Miramichi.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

CHICAGO AND THE WEST.

The Wild Pigeon.

CHICAGO, Jan. 21.—Every now and then we hear of the appearance in parts of the North of the passenger pigeon, a bird thought to be nearly or quite extinct. Of course it is impossible in many cases to verify the reports of such occurrences, and usually I presume it safer to doubt them, barring testimony of a competent ornithologist. I have just come across over in Michigan, however, of some positive testimony on this head, through which it can be proved that the passenger pigeon has actually been seen and killed in this region within the past year. Indeed, the proof of this may be seen at the city of Grand Rapids to-day, in the shape of two specimens of the bird, which were killed and mounted in the month of July, 1898, and are now in the possession of Mr. Otis Watson, of Grand Rapids. The birds were killed about four or five miles west of Grand Rapids, on Mr. Watson's farm.

Five years ago a number of passenger pigeons were found in the market at Grand Rapids by Mr. D. G. Henry, of that city. They were even then so great a rarity that Mr. Henry purchased a pair of them and made from them a painting.

Mr. Frank Rodgers, prosecuting attorney of Kent county, in which county Grand Rapids is located, told me that last year he saw two passenger pigeons about eight miles west of Paris, Mich., where the State fish hatchery is. It was in early summer. The two birds were perched on a tall pine stub near the road. Of all the above, the two stuffed birds are the most recent and available proof, and it seems sure that the wild pigeon is not altogether extinct, or at least was not last year.

North Dakota Game.

My friend Clint Smith, of Fargo, N. D., writes me entertainingly about the sport which is present or possible in his far-off Northern country. I say far-off, but really it isn't far-off if you live there, but on the other hand this part of the country would in that case be far-off. We are apt to think that folk who live in the West don't have as good time as we do, and we suppose they have to sit up nights twisting hay to keep the baby warm. As a matter of fact, they don't burn any hay in Fargo, and as for fun, the man who lives in a good live Western town like that gets more out of life than a dozen men do who live in the grind of city life, which is about the poorest way to live that ever was devised. I never could see why city people get stuck on themselves. Anyhow, this is what Clint Smith says about it:

"It has been many moons since I saw you last—do you remember where? It was at Scheik's, in Minneapolis, where you ate a whole prairie chicken, the game warden got away with a lobster and your humble servant did his best with a dozen fried and a steak. We have had a fine winter, not a great deal of snow and not very much cold weather. We have had some great sport with the greyhounds, chasing foxes; they never were so plenty as they are this winter. At the present writing we have taken the pelts off of forty-one of them. We started to make it fifty, but now we have got bloodthirsty and want to make it one hundred. And I think we will if we have good luck and good weather. We have six hounds, and let two or three go at a time. The sport is great! We have got the greatest killers you ever saw; they simply chew them up and get chewed some themselves.

"Forty-one foxes less in the country will help the chicken crop some. Chicken prospects are good. A good many are wintering here. One day when we were after foxes we saw four large bunches of chickens, and they looked fine. If we can get a law through the Legislature this winter, changing the law to Sept. 1, and shorten the season, having it close Nov. 1, and if a few more foxes are killed, there will be no reason why we shouldn't have chickens for years to come. And now I will close by giving you an invitation, which, if it is a good ways off, is meant just the same. Come and have a chicken shoot with us next season. The black pointer Nance is gone, but we have got more; not quite as good maybe, but they can find birds. I want you to come and make my house your home while here. And myself and wife will do our best to entertain. My pacer will be at your disposal, so you can ride around, see the sights and not ride behind."

How they do it in Nebraska.

Mr. George L. Carter, of Lincoln, Neb., secretary of the Lincoln Gun Club, and a law-abiding sportsman, writes me fully and interestingly regarding the game and the market-hunters of Nebraska. It would seem that those generous corporations, the express companies, who are always anxious to help the game wardens, have about the same methods in Nebraska that they do in Illinois and Wisconsin. It is well known that there is as big a game "fence" at Omaha as there is at Milwaukee. I know of no remedy for these matters unless it be to put the facts in the hands of every citizen of the State of Nebraska. There are few States which have suffered more at the hands of the petty game thieves than this once magnificent shooting State. Mr. Carter's letter tells its own story directly:

"The season for the killing of prairie chickens and quail, just closed in our State, brings the sportsmen of Nebraska to a realization of the real condition of things, and should result in an effort for a remedy. Birds, especially chickens, were so thoroughly shot out a few years ago that market-hunters did not find their business so profitable as in former years, and the traffic was reduced to a minimum, with the result that, aided by good seasons, both chickens and quail have increased wonderfully the past two years. But I am sorry to say that, with their increase, comes also the increase of the ever-despised market-hunter, and shooting for the market was carried on to an alarming extent the past season. We have a law in this State prohibiting express companies from carrying game, but having only the regular elected officers of the State to enforce these laws (in which they have no particular interest) they are of but little value. Not that the express companies openly violate the laws, but they do carry great numbers of birds for these unscrupulous parties under fictitious labels, such as 'but-

ter,' 'eggs' and other things equally misleading. I am told that there was a cold storage house operated in the western part of this State the past season, supposed to be an egg storage, but was really a fence for the illegal shipping of chickens. They would either be packed in butter tubs and be billed out as 'butter,' or in egg cases, with a layer of eggs on top, and be billed out as 'eggs,' and consigned to St. Louis and Chicago commission houses.

"While attending the Du Pont tournament in Omaha last fall, I heard one market-hunter from the northwestern part of the State remark that up to that time, which was the 22d day of September, he had killed 933 chickens. This I figure would be an average of about fifty a day, and enough birds to furnish 100 of the sons of fair Nebraska who go afield purely for sport with a day of honorable, healthful and invigorating recreation. Another characteristic of these market-hunters is their utter disregard for the closed season, it being an undeniable fact that chickens are slaughtered from the time they are able to cover the grass in their feeble attempt to fly. The same element so disastrous to our chicken supply also carries on operations through the quail shooting season. Last November, in company with my friend, C. E. Latshaw, I made a trip to the western part of the State for a few days with the quail, we deciding on Wilsonville as our destination, believing it to be the best point in the State for quail. Arriving there at noon on the 25th, we were assured that we would have no success, as market-hunters had shot the birds out. We, however, proceeded to our favorite haunts, where birds were always plentiful, only to find a few scattered birds, and they very wild. On returning to town, we called on the express agent, and asked him if it were not true that a great many quail had been shipped out under fictitious labels. He answered us very gentlemanly now, that not being the State game warden, he, of course, was not expected to open every package coming into his office, to see if it was dressed poultry or otherwise, but admitted that since the season opened their produce business had greatly increased. Another of the clever schemes resorted to by the market-hunters, and especially those living near the markets of the State, is to pack their birds in large trunks and carry them as baggage. Being disappointed at that point, we went to Cambridge, where we killed a nice bag of birds the two following days, and on our return to the hotel, preparatory to starting home, we were approached by numerous parties, presumably scalpers or local market-hunters, asking us in confidential tones what we would take for our birds. On receiving rather chilly answers that our birds were not for sale for any amount they could offer, they would slip aside with a countenance suggestive of 'Well, perhaps I make a mistake.' Our experience was the experience of all other sportsmen I have talked with, and their indignation is so great it is quite likely that ere long we will be in better position to protect the birds of our State."

The Hudson Bay Knife.

Mr. Bradford A. Scudder, of Taunton, Mass., wishes to have further details about the Hudson Bay dagger recently mentioned in these columns. He remarks:

"Will you kindly favor me with the weight and length of blade of the old Hudson Bay Company's knife, described by you in this week's issue of the FOREST AND STREAM. I should like the maker's name and the address of the New York firm by whom the one you received was imported. I judged from your description that the above is a sheath knife. Am I correct in so supposing? It is rather difficult to find just what one desires for a special purpose in a knife. I had been searching for a heavy knife to be used as a sort of machete in cutting through bushes and briars along the trout streams, and from your article judged this would be the one par excellence. If you think this knife would be about what I desire, kindly inform me."

At this writing the knife is at my residence, and I cannot give its weight and measurements. I think the blade about 1 ft. in length, very heavy and strong, the whole weighing, I should judge, between 2 and 3 lbs. I can assure Mr. Scudder that it would be admirable for the purpose he suggests. As to the firm of whom these knives can be obtained, I cannot give the name, as the knife was a present to me from Mr. C. S. McChesney. If the latter were addressed, I am disposed to think he would tell where the knives could be obtained, as he is a thorough sportsman himself, and always anxious to do another a good turn. Mr. McChesney's address is Troy, N. Y., and if he should happen to have a large mail inquiring after knives, I hope he will forgive me. I have not yet been able to find Mr. McChesney's gold seal rubbers with leather tops, and he may dislike me for that, but I will get them yet somewhere.

The Food of Quail.

I discovered the following information in regard to the food of quail as given in the columns of an exchange. I presume it not to be strictly accurate to say that quail never eat grain, for I have found wheat and corn in the crops of quail; but it was wheat from old stubble fields and corn scattered upon the ground, and not taken from the ear. The claim that quail do damage to any standing crop is of course absurd. The item reads:

"Don't Kill the Quail.—Two quail were sent to the Agricultural College by a farmer who wrote that he killed them because they were eating his grain. He wished an examination of the crops of the birds made, which has been done, and the results made public. In neither crop was found any grain, but in one of them were about 4,500 seeds of the false nettle, a very troublesome weed, which goes to show that the quail, instead of being an enemy of the farmer, is in reality a great help. Prof. Barrows, of the Agricultural College, says that quail eat a very large variety of weed seeds, besides grasshoppers, chinch bugs and other injurious insects. He once examined a quail's crop and found it filled to its utmost capacity with span worms and measuring worms, both of which are among the farmer's numerous enemies."

Pah-kuk-kus.

Once upon a time I had occasion to tell somewhat of

the doings of Pah-kuk-kus, the evil spirit which made so much trouble for us on our Blackfoot hunting trip. Later on I have described how in all probability I caught Pah-kuk-kus in a steel trap, which he carried off, never again to be seen. This would appear to have settled the spirit in question, but I have reason to believe that I brought him home with me in an Indian parfleche, which came from the Blackfoot country. I am disposed to this belief by certain recent happenings in my own household. There is a moose head on the wall of my dining room, which was put up with apparent security, and which hung on the wall untroubled for many months. One morning the mistress of the manse happened to be standing directly beneath this moose head, when without any warning whatever, and without the least jar or disturbance to give any pretense of reason therefor, this moose head turned itself loose. Nothing but a heavy coil of hair saved the lady from annihilation, as the nose of the moose struck her directly on the head. Not much later, I was one day putting up a buffalo head on the wall of the same room. I was standing on a short step ladder, and had hung the head, as I supposed, securely on a stout spike. I had just withdrawn my hands and was about to descend the ladder, when all at once the head jumped clear off the nail. Instinctively I put out my hands and caught the heavy head, suffering a sprained thumb, which bothered me for a long time. Last night I was awakened from my slumbers by the sound of something heavy falling. I discovered that a picture of some snipe, which had been hanging for months in that same faded room, had concluded to let go, and try it on the floor awhile. The corner of the frame was well smashed. I am personally entirely satisfied that Pah-kuk-kus has followed me ever since I got him by the foot in the Two Medicine country. My mistake was in supposing that you could destroy a spirit, or mitigate the maliciousness of this particular spirit, which is well known to live for the purpose of making trouble for hunters.

The Old Dog.

A while ago I had occasion to say something about the "old gun," and now I must make obituary mention of the old dog. The gun was my gun, but the dog was old Jack, the long-time solace and pride of Mr. W. B. Mer-shon, of Saginaw, who writes me about him:

"We have had a death in the family. Now do not get worried, but read a little further. It is old Jack that has departed from this vale of sunshine and tears. He has been a gay old dog. I have had a pile of fun with him, and I do not believe there were many better, all-round partridge and quail dogs when he was in his prime. His fashionable name was Jack of Naso, No. 7044. My old friend, Bob Schultz, of Zanesville, O., gave him to me when he was a puppy, for he was born in June, 1887. He has lived an aristocratic life of ease for the last few years.

"It seems too bad that a dog grows old so soon. Here I am, in the prime of life, at least so I consider myself, and yet I have seen three generations of good, old dogs pass away.

"Poor old Jack! He was as staunch as a rock, and had a nose on him that could locate honestly half a mile away; at least it seemed so to me, for I have followed his stiff-legged walk with just nose up, taking me across two or three fields, saying his as plainly as he could that the tainted air that was just stirring in his direction was telling him that we would be up with the birds before long.

"I remember once his taking up a scent along a fence corner, and putting his nose in the air, disappearing over the hill. By the time I reached the hilltop he was fast on the birds, a long ways ahead, though a friend of mine with his dog had just passed there; a great deal nearer than old Jack was to the birds when he took up the scent. I called back my friend, and together we put up the covey. I remember so well how nicely they scattered, and what a trimming out we gave them.

"Oh well! if I keep on at this rate I will think of hundreds of reminiscences equally as pleasant. Peace to the old fellow's ashes. I do not believe I will ever get as good a dog again."

I remember Jack very well. He was an old, very old pointer, and so crippled with rheumatism that he would weep and moan every morning when he tried to get up. We would have left him at home, but that seemed to hurt him worse than to take him along. We would put him tenderly down on his poor, old, stiff legs, and he would waddle and whine, and whine and waddle, complaining over the cruel years which handicapped his powers, but none the less putting the last flickering spark of his energy into the best way to show us a little of the sport that he loved as well as we. He had as much bird sense as any dog I ever knew, and though he could not "range" at all, he always went to the place where the birds were, and I think we killed more birds over him than over the younger dogs. Jack was one of the big, strong, staying, old-time meat dogs, and I mourn sincerely with his owner over his loss. There are not any too many such dogs in the world. I hope he finds plenty of sport in the happy hunting grounds.

He Speaks in Gold.

The French have a saying, "He speaks in gold," which means highest approbation of the wisdom of one's utterances. So much we might say for this editorial utterance of the Fox Lake Representative, a Wisconsin newspaper:

"There is no question but that something has got to be done to protect the game if it is to be preserved for future generations, and at a not very distant day either. The pursuit of game should be indulged in only as a sport, and the sooner that market-hunters are abolished and the sale of all game prohibited, the sooner will that blissful condition be realized. We know that this a pretty decided step ahead of the ideas of the country sportsmen in general, but we stand firmly on that platform and believe that the man who uses the game of the country as a means of making a living should adopt some other means for a livelihood. It has got to come if future generations ever get any shooting."

"George Barton, a Trask River trapper," says the Tillamook Herald, "caught a curious animal in one of his traps. The animal, or duck, was about 3 ft. wide by 1½ ft.

long. Its back was covered with feathers. The stomach held a flush of scales. Its tail was like a fish, and its head was ornamented with a bill and comb, while its forefeet were webbed, and the hind ones were just like a dog's."

In my confession of faith I believe in the fantail deer, the pine-nut bear, the horn-tailed snake and other things not usually accepted as lead pipes from a scientific standpoint, but one has to draw the line somewhere. Has any gentleman lost a pet ornithorhynchus which has wandered from his fireside in a fit of absentmindedness?

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

New Brunswick Notes.

THE Provincial Government seems to have definitely decided to make no exhibit this year at the sportsmen's show in New York. Doubtless the fact that a general election is at hand has a distracting effect upon the honorable gentlemen, if indeed it does not chill their sporting blood. The main reason, however, why this Province will not be represented is that the Government claims to have been unfairly used at the Boston show last March. Hon. Mr. Dunn had the assurance of the management that the New Brunswick exhibit would not be subject to duty, yet the customs officials pounced upon the outfit at Vanceboro and would not allow it to proceed until nearly \$400 had been collected. The goods exhibited all came back to the Province, but the money has never been refunded.

Righteous indignation is a good thing in its place, but should only be indulged in by people who are well supplied with common sense. The Fredericton Board of Trade is evidently carrying a rather slim stock of the latter commodity. At a recent session it solemnly adopted a long string of resolutions, calling upon the Government to pass regulations to have all moose, caribou and deer heads taken out of this Province branded so that they would not be credited to other localities. The immediate occasion of this outbreak was that at a celebration held in Boston over the big moose shot in this Province by Dr. Bishop, the press reporters described the animal as hailing from Maine. It is unlikely that the Government will do any branding—unless they can capture the press reporters.

Voe to the man who claimeth a record; when he waketh in the morning, behold! it is gone. It appears after all that Dr. Bishop's moose is not the best specimen taken on Miramichi waters, as the moose shot by Capt. Chauncey P. Williams, of Albany, heretofore credited to the Tobique, was really killed on the Southwest Miramichi. Capt. Williams' head, spreading as it does 63 in., with 19 in. palms and 32 points, is undoubtedly the best all-round specimen secured up to date in this Province. A moose was also shipped from the Canaan country by the well-known guide James Ryder in the latter part of December, with a spread of 62 in. A sportsman, described by the St. John papers as T. March, of New York, is credited with taking out another 5 ft. head.

Henry Braithwaite has received a license from the Quebec Government to capture six live caribou for shipment to Lincoln Free, of Easton, Pa. Henry will proceed to the scene of action in a few days.

Arthur Evans, of Zionville, on Dec. 31 shot a very large bull moose on Cain's River. The head has been shipped to Mr. John G. Prouty, of Spencer, Mass.

It is unlikely that any radical changes will be made in the game laws at the approaching session of the Legislature. It is probable, owing to caribou being so plentiful, that the limit on these animals will be raised to two. Some English sportsmen complain that they are not allowed to kill enough game in view of the great expense involved in making a trip across the pond. It is suggested that the Government might adopt a sliding scale in regard to the license fee, permitting the sportsman who paid \$20 to shoot one moose and one caribou, while a payment of \$30 would entitle him to one moose and two caribou, and a payment of \$40 entitle him to two moose and two caribou. From a revenue standpoint such a system would doubtless prove a great success; whether the game supply could stand it is another question.

FRANK H. RISTEEN.

FREDERICTON, New Brunswick, Jan. 28.

Winter Food of Red-Shouldered Hawks.

MILFORD, Conn., Jan. 20.—*Editor Forest and Stream.* During the last days of December I caught a pair of red-shouldered hawks in a steel trap. The trap had been set for a mink, which had been seen back of the barn, and which was suspected of having killed some chickens in the hen house near by. The male bird was first taken.

When I found him he was about to escape, as the trap had broken his leg and he had eaten away most of his shank; one strong tendon still holding him. The trap had been baited with fresh pork. My first catch in this trap had been a bluejay, and all that I found of the bird was its skull and beak. Surrounding evidence indicated that the hawk had made a meal of the luckless bird.

The second day following I visited the trap in the morning, and was surprised to find only the iron bar which had served to hold the chain to which the trap was wired. Looking over the neighboring ground, I saw a large hawk hop clumsily along, and then fly laboriously a short distance, with the trap and chain dangling behind. After some slight difficulty, I caught the bird, a fine plumaged female, of the same species as the first, and undoubtedly his mate.

I determined to mount the pair, and after taking off the skin, I examined the crops and gizzards, and was greatly surprised to find, beside the remains of small birds and field mice, the nearly complete bodies of two fingerling trout. Close to the trap lay the spring sources of a celebrated trout brook.

M. G.

Michael Demar, of Long Island City, had for twenty-five years owned a horse to which he was greatly attached. Mr. Demar had requested that if he should die before the horse the animal should be led directly behind the hearse when the burial took place. Mr. Demar was buried yesterday, and the old horse, draped in black, followed his master's body to the grave.—*New York Times*, Dec. 17.

Iowa Realities and Unrealities.

VINTON, Ia., Jan. 27.—*Editor Forest and Stream:* Last winter there were nine hounds in Vinton. They were of different blood, but all of them would run wolves. The most of them were young, but would hold a track from twenty-four to forty-eight hours. No two hounds were owned by one man, and nearly every day some of them were across the river in the bluffs running wolves. They had many a scrap with the big timber wolves, and sometimes came home more or less cut up. One wolf that they killed was found on a bar in the river. Eight miles from Vinton they had a wolf nearly run down, and the wolf went through a farmer's yard and jumped into his hog lot, and made a stand among the hogs. Of course the eager hounds jumped right into the lot and pitched on to the wolf, then from fifty to 100 hogs pitched on to both the wolf and dogs. The uproar that followed soon fetched the bare-headed farmer to the scene, and in an instant he had a club and was in the thick of the fight, and while the fur, hair and bristles were flying, he got a crack at the wolf and laid him out. At another time the dogs had a wolf nearly played out, and a man on a horse killed it with a club.

Last spring I went out with Mr. Upple and six of the hounds. For quite a while we stood on a runway and listened to the dogs, who seemed to be having trouble down in the timber a mile away. On going to the dogs we learned by a man that a prairie wolf that was heavy with young had passed there thirty minutes ahead of the dogs. I also learned that this pack of hounds could not follow the track of a wolf or rabbit if the latter were in that condition. This was new to me, and I wonder if it is true of all dogs.

This pack of hounds shortly afterward came to a sad and treacherous end. They had stolen out of town and were hunting alone. They did not return, and in a few days Mr. Upple found on a bar in the river seven of them that had been poisoned. The other two escaped.

This winter a badger was killed not far from Vinton. It is the only one killed for a good many years, although in early days they were numerous.

A flock of twelve geese stayed on the prairie north of Vinton until Jan. 4, when they went south ahead of a storm. Quail are very plentiful. It has been a good winter for them. Little snow and not extreme cold weather. Chickens seem to be in small scattering flocks. Jack rabbits are increasing.

The hunters' trespass law gives fair protection to game on the prairie, but everything in and near the river is free booty.

MOUNT TOM.

In the Woods and Out.

AN Indiana correspondent, who subscribes for the *FOREST AND STREAM* to be sent to a guide in Michigan, writes:

"Buchanan is a professional hunter and trapper and guide, and one of the most hospitable, generous, modest fellows in the world, and I do not know of anything which will give as much pleasure as this.

"He told me (and I have no doubt of his absolute truthfulness) of the lawlessness of self-styled 'gentlemen' who come up into the woods, and finding themselves far from game wardens, pay no attention to legislative enactments, or the laws of common sense which these embody, but do just what an unbridled instinct prompts. It is easy to see what moral a man reared in the woods must draw from such an example.

"I hope you will continue to hold up to scorn the 'sportsmen' who consider game laws a good thing for others, but not for themselves—and by-the-by, do you not think that when you publish a letter from a correspondent who boasts of stealing game or fish, or of poaching on strictly preserved property, which is the same thing, you ought to show your disapproval by some comment? Not long since, I forget the date and the name at this moment, such a one told in your columns of his experience in stealing a fine trout at Carlsbad. The description was quite realistic; how he concealed his tackle so that no one would suspect his design, how he crouched down and hid behind a wall when the guardians of the property were in sight, as any other thief would; how he hid his plunder when concealed, etc., etc.

"Would you publish a well-written and detailed account of a successful raid upon some gentleman's hen-roost or into his cellar?"

LEXDEN."

Florida Game and Fish.

DE LAND, Fla., Jan. 6.—Quail were unusually numerous about De Land early in the season, and some of them are still left. The forage and cover for them is better in this part of the State, I think, than in many others. The crop of wild peas has been very prolific.

A few ducks are being bagged on the upper St. John's, most of them wood duck, the best local variety.

A friend just back from the East Coast says that trout and sheephead are biting voraciously there, but other varieties of salt-water fish not so well. The ducks have either not come south yet or are kept off the rivers by steam launches. Sea bass (?) were numerous off Smyrna in the fall, and the same friend landed one which, he informs me, weighing 35lbs., and caused nearly an hour of hard work.

The threatening weather this season has influenced hunting.

H. R. STEIGER.

Shots that Happened So.

ONE of the most remarkable rifle shots, or rather pair of shots, ever known, happened out in Wyoming a few years ago, and is vouched for by the son of a brigadier general, U. S. A., who was a participant in the hunt where the shooting was done. "My guide and I," said this gentleman at the Camera Club the other evening, "were out in the mountains one fall after deer, and we succeeded in creeping up on to a bunch of four and killed three almost instantly. The fourth escaped unhurt from our first firing, and started off at full speed along the edge of a sort of clearing. The guide fired twice as carefully as he could, but was not able to stop him. After a third shot, the buck ran a way and lay down. I worked carefully around a hill and when he saw me he was up

and off again like a streak. I let him have a shot from my little Winchester 'tick-tack' and bowled him over. When we came to examine the buck, we found that every ball fired had taken effect. The first two shots had bored round holes in the right and left ears respectively, and the third shot by the guide had passed nearly through the deer's body, but not in a very vital part. This shot, however, had caused him to lie down, and thus enabled me to get to him."

Deer are often shot through the ears, but I never heard of another instance of their ears being bored separately by two consecutive rifle shots.

PETER FLINT.

NEW YORK CITY.

Odd Quail Shooting Incident.

LAWRENCE

MILFORD, Conn., Jan. 20.—*Editor Forest and Stream:* I have to tell a shooting story. It borders on the improbable, but I know it must be true, for it was related to me by Mr. S. W., a gentleman who is noted for his exact statements and his adherence to facts.

Mr. W. and his friend were hunting on the grounds of the H. F. A., of which both are members. They had started a small bevy of quail. Subsequently a scattered bird or two were shot at, and one of them seemed badly hit, but kept on toward an old ruin, a Connecticut farmhouse. Only the chimney was standing, and as the hunters watched the bird in its flight, it seemed to disappear beyond this chimney some 200 yds. away.

As they hunted around in the little swamp just beyond, they missed the dog, but finally found him pointing close to the base of the chimney, where the old fireplace had been. Finally Bob broke his point and disappeared. Then they heard him scraping and scrambling up the chimney, and in a few moments he reappeared, coming downward and backward with the dead quail in his mouth.

M. G.

Wild Rice in Chesapeake Waters.

PHILADELPHIA, Pa., Jan. 26.—*Editor Forest and Stream:* I would be glad to hear what experience, if any, some of your correspondents have had as to the successful planting and growing of wild rice in Chesapeake waters.

I am a member of a ducking club, and we have tried for several years to successfully install this plant, and while we have had it grow, we have never had it propagate itself. We are very reluctant to give up the enterprise, but have already expended considerable money without results, and hesitate to make further efforts without knowing more certainly that the plant has been successfully grown thereabouts. Our shore is north of Baltimore, opposite Carroll's Island.

J. S. L. W.

In Louisiana.

A CORRESPONDENT writes from Provencal, La., of the game supply and controlling conditions: "We have a fine crop of partridges in the vicinity—found mostly in open pine woods in thick grass. They are unusually fat. We have an abundance of gray foxes. A good pack of hounds here will outgeneral Reynard in about two hours. There are no red foxes. Deer once were very plentiful; they have been almost annihilated with the improved arm and the head light. Our laws in this State do not furnish the beautiful animal sufficient protection, and laws are not enforced. Woodcock are scarce. We have very few ducks; sometimes they make us a visit, but so many shoot them; they are not allowed to light, and infrequently evaporate in the air for want of food."

A SPORTSMAN.

Maine Moose Statistics.

A MAINE correspondent writes: "The number of moose taken in Maine, as published, is far from correct. Of 101 received up to New Year's by one taxidermist about fifty were killed in New Brunswick, Nova Scotia and Canada. I think that 100 will be ample estimate for every moose taken in Maine in 1898. The railroads and the commissioners wish to make a good showing, and so the railroad counts every head carried as coming from Maine, and the newspapers double that on the supposition that as many more have been illegally killed."

Camp-Fire Flickerings.

"That reminds me."

Mac's Fox Hunt.

AN I niver tould ye about me an' ould Patton havin' the fox hunt. Well, sor, 'twus the funniest thing ye ever see. Ould man Patton was a naylor of moine, livin' down betuxt Jim Casey's farm an' the crick, an' as quare an ould chap as ye'd see in many a day. He was a little man, widout much mate an him, an' purty well bint up wid age, for I think he was moighty near eighty, but shpry for all dhat. He had a harse that was nearly as ould as himself; an' anny toime, day or night, the ould chap was ready to hitch up an' dhrive into the village wid anny of the lads.

Well, wan day wan of the lads was tellin' me he knowed where they was a foxes' din, about a moile over in the woods, an' axed me would I go over wid him an' dig him out. "I'd go," I sez. But in dhe marnin' the lad hirt his feet an' couldn't go, an' so I axed ould Patton would he go, an' he sez, "I will," he sez, "for I niver wint an fox hunt in me loife," he sez. So we tuck our shovels an' stharterd for the din. Well, we r'ached the place all roight, and commenced to dig the foxes out; an' me an' the ould man dug for a couple of hours; but dhere didn't same to be anny ind to the hole, an' ould Patton sez, sez he, "Mac, there's a divil of a lot of harrd wurk about fox huntin'," he sez, "and I've a good notion," he sez, "to go round," he sez, "an' dig up from the other side," he sez. "Ye'd hev to dig 10,000 moiles," I sez, "an' we haven't got toime," I sez. An' so we med up our moinds we'd give' up dhe job an' stharterd for home.

An the way back we sthapperd at Tommy Black's place for a dhrink, for diggin' 's moighty dhrly work, an' we found Tommy out behoid the house, havin' bees, an' we

stud there an' lucked at thim for quoit a whoile, whin purty soon some of the bees lit an ould man Patton's legs. I tould him to stan' still an' they wouldn't hirt him, but he commenced to knock thim aff; an' the first thing he knowed, dhe whole swarm wint for him, an' ye'd 'a' died laffin' to see the ould chap put for dhe bush, an' the bees afther him. He was throwin' his arms around his head an' legs, an' yellin' "Git aff out of dhis! Git aff out of dhis!" Purty soon his wind gev out, an' he culdn't run a sthep, so he sthopped an' stuck his head in a bush, an' stud dhere, doubled up, wid dhe whole of his legs an' body stan'in' out big an' woide, for the bees to laight an, an' boy dad dhey did loight an him, too. I belave if we'd left him there, for foive minits we c'u'd have schraped two quarts of honey aff his pants, but foinally we got him away from the bees and into the house, an' thin stharterd for home, an' the ould man was dhat swelled up you wouldn't have knowed him. An the way I sez to him, I sez, "Wet clay'll take out the sthings," I sez; but the ould man sez, "Dhere isn't enough clay," he sez, "in the whole State of Michigann to do dhat," he sez. Whin we got up boy moy house, dhe ould man wint an a few stheps, an' dhin kem back aga'n, an' shakin' his finger in moy face, he sez: "Mac," he sez, "dhat was the first fox hunt I iver wint to, an it'll be dhe lasht."

G. J. B.

I am reminded of an incident of my earlier hunting days. I was about sixteen years old, a fair shot and passionately fond of any kind of shooting, which in fact I have never outgrown. The day before this incident there had been a grand hunt; the moon was full, with high tide in the morning, helped by a stiff sea breeze. Five shooters started out in their sneakboxes. I was one of them. At noon we all took account of stock on the hotel veranda. I had thirty-eight marsh hens, the other four had in all thirty-two. Spangler, a reporter for some Philadelphia sporting paper, was one of the five shooters; and he said he was going to write me up. I was elated.

The next morning I got one of the fishermen to set me on Seven-Mile Beach. I had started out with the determination of making a record on snipe, to go in with the rail story. I potted about a dozen sandpipers, and was about to give it up for a bad job, when I heard some curlew. Crouching down behind a tuft of grass, I called them, and although the attempt was crude they circled and dropped into a small pond, formed by the high me, and there was nothing to prevent my getting a pot-me, and there was nothing to prevent my getting a pot-shot at them at 20 yds., except two swampy little holes filled with water. These didn't phase me in the least. I crawled wormlike, without daring to look up, until at length, after what seemed to be a two-mile crawl, I reached the sand hill and peeped cautiously over. The birds had disappeared. I stood up, disgusted, when a shrill whistle back of me drew my attention to seven curlew sailing off leisurely 40 yds. or so away. They had passed me within 40 ft. while I was crawling toward them. My gun was soaked with salt water, so was my watch, and my clothes were in a sad condition. It is needless to say that Spangler had no occasion to enlarge his article on my success as a snipe shooter.

CHAS. G. BLANDFORD.

It was bedtime for little five-year-old Howard, and his mamma undressed him. For some reason he did not want to say his usual prayer—"Now I lay me," etc.—and his mamma said: "Howard, you do not want to go to sleep without first asking God to take care of you, do you?" He looked at his mamma, then answered: "Why, papa has got a gun!"

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

Florida Fresh-Water Fishing.

THERE is good fishing at Auburndale, in Polk county, Fla. A resident told me that there were over seventy lakes within five miles of town, and that many of them had never had a line in them. I took his word for it, as I was apt to find several new ones every time that the neighborhood was explored. Ariana, on the north side of the town, furnished us with all the fish and sport necessary. Frequently the water would be churned in every direction by large schools of bass after minnows. A visitor from Schenectady, N. Y., who took these commotions for tropical waterspouts when he saw them for the first time, came ashore. He was very quick, too, when he saw anything unusual to understand what it meant; but those disturbances had startled all of us. The speckled perch were often as much in evidence.

Shiners were considered the best bait for bass. We caught these minnows near the thick bunches just beyond the water grass belt along shore. Switches were used for rods, and threads drawn through small bottle corks for lines. The hooks were the smallest that we could find—about a No. 14 Carlyle, I should judge. The bait was either dough mixed with raw cotton or grubs called "sawyers," found under the bark of dead pine logs. We would push the boat a few feet into the grass belt and then fish in the open water beyond the edge to catch shiners. Their mouths were tender, but by landing the minnows on the floor of the boat many of them were secured that fell from our hooks. When we could not catch shiners, we fished for very small perch around floating logs, and in the pools among the grass, and used sawyers or bits of top-water minnows as bait for them.

Every one has his own theories about fishing. Mine are numerous. One is that the season here begins with February and extends into June. Another is that the most productive water of the lakes is within 150 yds. of shore. Our favorite position was several boat lengths out from the grass, where we could cast to either side. We made our largest catches on afternoons of warm, bright days.

The bass were somewhat erratic in their movements as the season advanced. Probably the schools of deep-water

Supplement to Forest and Stream.

RIPSEY.

minnows that came to shoals for spawning influenced them. Sometimes the bass were most numerous on the smooth side of the lake, and would remain there for several days after the water had become rough, then disappear, to be found again exactly across the way. The bottom of our lake was nearly basin shape, but there were a few inward channels, and the bass would approach shore by these. We took pains to locate these places.

I remember discovering such a channel at one time and marking it by a gum snag ashore. The next day a companion and I blistered our faces catching minnows, and in the afternoon went up there. Of course, my friend had heard a seductive yarn before he consented to go with me. I was sure we would have luck. But casting our bait around became very tiresome. After awhile we set our rods. Then each of us set an extra rod. My friend should not have looked at me in that manner. After I had turned my back I could not see his eyes. The sun had sunk very low. Then "zip," "zap," "zoo," and three reels were singing beautifully to us at once—music that continued with scarcely an interruption for over an hour. When it ceased there were more than 30 lbs. of bass in our boat flopping gayly. Our awkwardness had lost a great many fish. During the row home my friend's eyes were not so disagreeable to face as they had seemed.

One afternoon four boatloads of us were hurried down the lake to try our luck in recently discovered territory. The notification had been too brief for some of the company to prepare. One young lady came in wine-colored silk and sported a parasol of robin-egg blue. Ned Howard, the real estate man, had hurried from his grove. His large corn-field hat served first rate for a bailer. Soon after we had settled to work, little Arthur and their negro hired man sneaked a fifth boat in just astern of our position. Owing to certain defects in Arthur's clothing, he faced us while fishing. It was the event of the winter in fishing circles. I enjoyed it.

There were times, though, when it would have been easy to dance on shore with vexation. Women tangled their lines in the grass so unnecessarily, and snatched hats off with their hooks. It was "If you please," and "Beg pardon" every minute. Little Arthur kept me dodging a dangerous gourd that he used for a float. There was much hilarity mixed up with serious discourse. Some of the party were interested in a "hop"; others in various topics, and the negro and I in fishing. He and I were catching all the perch too. But there! About the time that I was feeling very proud of myself the Doctor's wife hooked an 8 lb. bass. And she was afraid of it! But she landed it. That fish must have been astonished when it saw us. It had swallowed the hook. The old chap must have crept in from the deep. I fished that lake constantly for three seasons, and my largest bass weighed only 7½ lbs.

That afternoon gathering of boats down the grass belt was a memorable experience; but very few fish were caught. Smaller parties were often more successful. On one occasion three of us went through to the next lake and caught all the perch that we wanted. Every lily leaf over there seemed to be a swarming place for hungry perch ready to seize our bait, and to make our floats pop. And how those floats did pop! It reminded me of shelling peas. We had to stop before we had used up half the bait. The sun was still high, and the fish were getting hungrier every minute. But we had caught enough for ourselves and for our neighbors. We had seventy-eight perch to take home, and the bunch would have weighed more than 50 lbs. We could have tripled the number, I think, if we had stayed by our work.

The speckled perch were fast biters when at work, each one was a puller, and some of those caught in Ariana weighed as much as 2 lbs., but all of them were sham fighters if compared to bass; for the latter never surrendered, and sly old Fagins that lived in shady streams taught tactics there to a hard lot of spawn.

One afternoon I went across the way to fish. The run over there lay between steep brush-covered banks, and connected the next lake with Ariana. The bass had come to the shade because of the hot weather, and were creating a disturbance in the run; but they were very coy, and made me woo them by my approaching on hands and knees to look over the bank with one admiring eye, a humiliating test that was exceedingly painful in thick brush, where sharp cactus needles cruelly wounded my knees. Those bass were superb, however, and after one was hooked, if it did not have me crashing through the bushes, it was likely to have the reel doing thrill music. Only six of them were caught, the largest a 3-pounder, but each one was worth a dollar.

This was one way of enjoying the sport, but there were others, and among them a method that was new to me. For awhile a family monopolized a cove up on the east of Ariana, where a deep channel ran in nearly to shore. The numerous children spent the morning catching bait, and the afternoon with their father fishing for bass at the cove. The parent waded out and took a position shoulder deep at the beginning of the channel, and the youngsters ranged on either side neck deep in the shallower water. Viewed from the lake the row of heads made a charming picture that changed from woefulness to smiles, according to luck. I never disturbed them, for they had my best wishes; I wanted to stand well with a father who would throw down his work thus to educate his family. Their rods floated in front of them, and when a fish was hooked it was hauled ashore. Sometimes a large bass on the line of a small child would make the issue doubtful. On several occasions lakeward bound children were rescued. One afternoon a hen 'gator interrupted sport. Loads of bass were caught, and the pastime was made remunerative. But it was hardly fair for them to bring fish to our house and thus interfere with my pleasure.

It was not difficult to catch a few fish if they were needed. I had found most of the likely places while cruising around in my canoe. Even the birds became acquainted with my craft and its crew. Sometimes, while I was fishing, the herons would stop in the shoal water a few rods away and croak a friendly hello. Several of them were either new to me or came in disguise. Perhaps Miss Willson or Didymus would have known them and have understood their lingo. A large 'gator that lived in the next lake was very sociable. If fish were not wanted, it was easy to find other amusement with a boat.

H. R. STEIGER.

Fishing Near Home.

"WHOW! Hot? Well, I should smile. Just see the mercury climb! It's to 96, and the coolest place on the farm. I hardly expect Will to show up this afternoon, do you?" And I examined the thermometer, which hung on a branch in the shade, and found it 96.

"I don't know," answered Sam. "It's a terrible walk from the electric cars, a day like this. If he starts he'll roast before he gets here."

"Shall we load the wagon, and try the trip ourselves if he don't come?"

"It would be a hard pull for the mare across the mountain a day like this."

"I know it would, but we could let her take her time, and it would be easier for her to haul two of us than three."

"That's right, too, but I'm against going unless Will shows up. What do you say?"

Rather to our surprise Will did "show up." Dripping with perspiration, he rounded a bend in the road about 6 o'clock. Then everything was rush and hustle, for we really had not expected him, and so had made no preparation whatever for the trip.

A tent, blankets, fishing rods, cooking utensils, provisions, and other necessities were hastily stored in the grocery wagon. Then, while Will and Sam puffed and sweat in an almost fruitless endeavor to collar a few angle worms, I harnessed the little mare.

It was 7 o'clock when we finally started, and the sun had disappeared back of the mountain in the west. Our objective point was the New Reservoir, in the town of Bethany, Conn. I had dropped a line in its waters one evening, and soon landed a fine pickerel. Being in a hurry at the time, I stopped at this single contribution to my rod. I had not tried those waters since, but had listened to wonderful stories of large pickerel being taken. My proposition to spend a night and day there some time suited Sam and Will so well that this trip was the outcome.

It was a hot climb to the top of the mountain for the little mare, and she was white with lather. The western descent was made not without difficulty, for the mantle of night had fallen. It was not yet time for the moon to rise, and except when at intervals the lightning blazed in the west the night was as black as a pocket.

Somehow, thunderstorms seem always to form part of the programme whenever I have an outing in the summer time. They are inconvenient, as is Dr. Dean's "ordinary dyspepsia" of the fishermen, which my friend, Major Mather, writes about. So far they have never killed me. The one in the west threatened for a while. Great banks of soot-like clouds poked above the Bethany hills, and the lightning flashed like hidden artillery back of sable intrenchments in the sky; and the thunder growled like a hundred lions in a rage. This dazzling display gradually worked below the southwestern horizon, however, then the "heat lightning" of our unobservant friends, who never realize that this is but the reflection of flashes from a storm far below the horizon, was in order.

After an up-and-down-hill trip of five miles, over rough, pitch-dark roads, we reached our destination—the reservoir.

We started down a rough cart path, which I remembered led to the water's edge, and had gone about 20 ft. when Sam, who was ahead of the horse, uttered an exclamation which halted the expedition. "We can't get to the water here," said he. "There's a whole mess of new rail fence, and no getting by it."

We scrambled around in the bushes, blackberry vines and greenbriars awhile, and finally discovered a road that led to some bar rails. We lowered them, and after entering an uncultivated field the rails were replaced. Half an hour was then spent monkeying with other bar rails, stumbling and ripping through vines and bushes, and driving over rocks and uneven ground that nearly wrenched the wheels off the wagon; finally we reached the water's edge. Here an ideal spot, in the heart of a thick grove of pines, was selected for our camp.

The ground was littered with dry, dead limbs. A good supply was gathered for a fire, the pine needles were carefully scraped away in one spot, and the fire was started. The horse was unharnessed, rubbed dry, tied to a tree and fed. The tent was erected, and after a hastily snatched bite rods were jointed and all hands moved to the water's edge. Sam and I fished, while Will reclined on the wagon seat, which he had lugged with him, and made sarcastic remarks about our fishing abilities.

It was after 10 o'clock, and half a moon had poked above the eastern horizon. It was an ill-defined blob, for its rays struggled fruitlessly to penetrate a mackerel sky. Sam was first to wet his line, and before my hook was baited an unfortunate bullhead was protesting in his relentless grasp. "Bullheads for breakfast," said he, hauling another victim from its watery element.

My hook had hardly touched bottom when I too drew a protesting fish from the water. They bit well, and we were kept busy unhooking them. We were agreeably surprised to find few mosquitoes, and as Sam slid another fish into the half-filled four-quart pail he ventured the information that it was "too hot for the cusses to feel like biting."

Not a ripple disturbed the mirror-like bosom of the lake. The ill-defined moon and stars, and the fleecy mackerel sky, were reflected from its depths so perfectly that one seemed to stand on the edge of the earth, and to look down into an inverted firmament. So real did imagination cause this to appear that I almost caught myself shrinking back, as one does when on the verge of a high cliff. A muskrat splashed into the water within 20 ft. of me; and as he hurried for the center of the lake he left a wake which marred the placid surface, and my illusion was gone. Now and then the cry of a bird came to us from the head of the lake, and the frogs regaled us with their raucous songs.

We had nearly filled the pail when the moon's rays penetrated a rift in the clouds, and flooded land and water with silvery light. The sounds of a steamboat's whistle came to us from Long Island Sound, fully ten miles away.

We got our plunder together and went to the tent. A generous supply of hay had been brought along in the

bags for the horse, and to be used for our bed. A rubber blanket was spread under the tent and littered with the hay. Four or five blankets and comfortables were spread out on the hay, and a bed was completed good enough for us weary fishermen. All was now ready for us to turn in, but a stray bull regaled us with a not at all pleasant note, and all hands voted an investigation before turning in. We were uncertain as to whether he was on our side of the lake or not.

"You fellows look after the horse and other things if he attacks the camp, and I'll shin to the top of this big tree and boss the job," volunteered Will. The bull, however, proved to be on the other side of the lake.

The mosquitoes obliged us with their absence, and we slept fairly well until sunrise. Then, while I devoted my attention to the mare, Sam skinned fish and Will gathered wood for the fire. While the fish were sizzling in the pan, I took my rod and tried for a pickerel.

The day was bright, and even at that early hour the rays of the sun were uncomfortable. Not a breath of air was stirring, and the lake was smooth as glass. The water was quite clear, and the bottom could be plainly seen near shore. Taken all in all, the conditions could not have been more unfavorable for pickerel fishing.

I baited my hook with a narrow strip of salt pork and commenced to skitter. I whipped the water for ten minutes without result, then substituted a spoon for the pork; this, however, yielded no better result, for the wary pickerel would not be lured.

A whoop from Sam soon notified me that breakfast was ready. The fish were crisp and brown, the coffee could not have been better, and the homemade bread and butter, and ripe red raspberries and other fruit, never tasted so good, it seemed. Then, the fire completely extinguished, Sam and I took our rods and went to the lake. Will satisfied his preference to lie under the tent in the shade and keep an eye on our things.

We fished for an hour or so, then, as nothing rewarded our efforts, Sam returned to the tent. I wished to have a look at the head of the lake, so fished on in that direction. I came to a spot where a stone wall entered the water and disappeared below the surface. Here I found a lot of pickerel scales, and they were from large fish.

Eight years ago there was no lake at this place. A delightful little trout stream flowed through the valley which now forms the basin of the reservoir, and a cautious fisherman's efforts might have been rewarded with a fair string of trout at that time. I once fished for half a day, and had the satisfaction of taking home nineteen beauties. Finally the New Haven Water Company cut down the woods and built a monster dam at a favorable spot, and the lake is the result. For an artificial body of water, this is a beautiful sheet. For most of its length the east shore is heavily wooded with pines, and peaceful farms slope gently down to its waters on the west. To the north green-forested hills form its boundary, while the dam stretches its length across its southern end. A road runs along the foot of the dam, and the old stream, that I once fished, makes its appearance to the south, where it flows under the road from the foot of the dam, and rushes roaring down through a heavily wooded ravine. I have no doubt that the stream would yield a few trout now; but the large pickerel of the lake are a mystery to me. I never saw any before the lake was there.

Keeping on, I fished over some likely looking spots, but not a fin rewarded me. It was about 10 o'clock, and the sun was so hot that I decided to return to the tent. Here I found Sam and Will about to start off for a look at the dam. I joined them, taking my rod with me.

We followed the shore in its windings, and had almost reached the dam, when a wild pigeon on a rock near the water attracted our attention. This was the genuine article, and not a mourning dove. I have read that the wild pigeon no longer visits this section, but I can say positively that I saw a flock of ten or a dozen last fall. I was close enough to see to a certainty that two were males. All the rest appeared to be females, but some may have been males. We watched the bird until it flew away. I fished right up to the dam, but caught nothing. Two stray pickerel did strike at the spoon, but that was as near as I came to taking anything.

Sam walked under the bridge that spans the overflow, and Will climbed over the new rail fence into the road. "Hello!" said he. "Here's a trespass sign; and it says, plain enough, that we have no business on the shores of this lake."

"Where's your sign?" I asked. "There was nothing of the kind when I was here last."

"Well, they probably saw you then, and put this one up to keep you away. Can't say that I blame them if that's the case."

"Possibly they found I was making a chum of you, and, thinking I might bring you this way some time, they put the sign there."

We bantered one another for awhile, then considered the matter more seriously. For one, I never care to intrude where I'm not wanted. That sign said plainly: "You are not welcome. Get out!" We decided to move at once.

We were a little mixed in getting across the fields to the road. This was not so with the little mare, however. She showed an inclination to lead the way, and we let her do so. She reasoned the right path out (no instinct about it), and took us direct to the road.

It was a hot drive home, but, covered with perspiration, we arrived there in a couple of hours, and thus ended our New Reservoir fishing experience. W. H. AVIS.

CONNECTICUT.

World's Fair Pickerel Caught.

A DISPATCH to the New York Sun from Delavan, Wis., dated Jan. 29, says that "while fishing through the ice, Tim Smiley hooked a 22 lb. pickerel. Attached to the fish was an aluminum tag, fastened by a ring through its tail. On one side is stamped, 'The Fisheries Building'; on the other, 'From the Fisheries Exhibit at the World's Columbian Exposition, 1893. Age, five years. Weight, 14 lbs.' The tag has the appearance of oxidized silver, but is very hard. The edges are worn away, but the engraving is clear and distinct. Smiley intends to have the fish preserved, with the medal attached, and may present it to the Field Columbian Museum. Fishermen here think the dates and weights will be valuable in determining the age of fish of this species."

A Melange.

BY FRED MATHER.

Black Bass.

THERE is quite a demand for black bass for stocking private waters, and no source of supply. There are a few dollars in this trade for a man who has facilities for breeding them, but no one seems to take hold of it. If I were permanently settled by a suitable pond I would grow bass for stocking waters. Each year I have letters asking where they can be had, and "I don't know" is the answer. The State of New York fills a few applications for these fish, but I think they are mostly yearlings which are sent out, and in small lots. A man in Sullivan county, N. Y., says: "I want a lot of 200 black bass, some of each species, which will spawn next spring. A man got twenty little fish some three or four years ago to stock five ponds with, and he has no bass fishing yet. A few small ones have been seen, but that's all."

To this man I say: Your friend scattered his seed too much. He should have put the twenty into the best pond, and from that stocked the others. As he received them when young, he could not distinguish sex, and he might mismatch them badly with only four in a pond. With twenty fish there is small chance that all, or most all, will be of one sex. Brains must be used in fishculture as well as in other things.

I have three other inquiries for black bass, and all want fish that will spawn next May or June, and that means fish from 8 to 12 in. or more extreme length. All these inquiries are outside the State of New York, and two want only the small-mouth, while the other wants both species. He is wise; put them both in and let the fittest survive. A bad name, given to the big-mouth when black bass first began to attract the attention of anglers, has stuck. It may interest a younger generation of anglers to know that forty years ago these gamy fishes were hardly known to anglers, and as soon as they began to attract attention some persons, to show their exquisite discrimination, began to praise one to the detriment of the other. Dr. Henshall and I have had the courage to fight this, and to say that in game qualities there is little difference, and that what there is depends on the weight of the fish, 2 lbs. being its fighting weight. Further than to say that the big-mouth is not so capricious about taking the fly as his brother—i. e., will usually take it more freely—I have not room to go into this subject here. I have written all this before and intend to keep at it until justice is done to a noble game fish.

What is wanted is a supply of black bass of both species, of a size fit to breed from each coming spring. Such fish, being comparatively large, are expensive to transport, as but few may be carried in a ten-gallon can, but there are men willing to pay for them and for delivery at their ponds.

That Frog Farm.

In FOREST AND STREAM of Jan. 14 the frog farm of Miss Mona Selden, Friendship, N. J., was noticed, and her remarkable results were commented on in a spirit of unbelief. I sent a copy of the paper to Miss Selden and wrote her. The letter was returned stamped "No such office in State named." This was not a great surprise, for an experience of nearly thirty years in running mythical frog farms out into the fog forecast such a result. Her name was analyzed for a catch, as once a brilliant reporter told about a Mr. Gorfon, who raised frogs in Indiana; but taking his name in reverse saved time and trouble.

A gentleman in Plainfield, N. J., writes that he has been unable to find Friendship on the map, and wants to know where it is. He will find it near the land where the bong tree grows, which is south of the mountains of Hepsidam, where the lion roareth and the whang-doodle mourneth for her first born, and close by the great mines of Limburger cheese and the inexhaustible quarries of soft soap.

Death from Fright.

A correspondent, who forbids the use of his name, which by the way would give his letter the stamp of authority, writes:

"In one of your entertaining and instructive papers in FOREST AND STREAM, in the 'Louisiana Lowlands' series, you refer to an instance in which the death of a squirrel could be attributed to no cause but fright, and invite communications upon that line of phenomena. The paper in question appeared within a few days after the occurrence of a very similar thing, which was to me at the time a puzzle, and is still unexplained save on the theory of death from fright. While shooting quail this fall my dog came to a point at a small brush heap; there were six of us standing near when the point was made, and no one had suspected the presence of any birds. One of the boys stepped up to take the shot, and I ordered the dog to flush the bird. The dog was reluctant about obeying, and I could see from the slight motion of his head that he was watching a bird skulking in the grass. After two or three orders to flush he jumped into the brush, and as the bird did not flush promptly he grabbed it and delivered it to me. The bird seemed to be entirely unharmed, and the whole party gathered around to look at it. Its eyes were bright, and there were no marks on it of any kind. I held it rather loosely in my hand, and as we were looking at it the bird gave a few convulsive flutters and was dead. I preserved it, and when picked it showed no shot marks, nor was it apparently injured in any way. The dog is very soft-mouthed, and there is no probability that he in any way injured the bird. There were six of us gathered around as we examined the bird, and its eyes bespoke its terror. I am firmly impressed with the belief that that little bird died of fright as I held it in my hand. I can account for it in no other way."

No doubt animals may die from fright, and men also. Here is a very recent case taken from a newspaper:

Northampton, Mass., Jan. 23.—Gertrude Walsh, seventeen years old, employed in the Nonotuck silk mill, died from fright to-day. While dressing to go to work she upset a lamp and set fire to her room. She fainted and never recovered consciousness. She was not burned.

Terror paralyzes the brain, and may stop the heart action. Men have been found dead on the battlefield with no mark of injury upon them; and amid the crash and shriek of shot and shell and the "ping" of rifle balls the man who says he never-felt fear should be eligible to the liars' club.

Let me relate a personal incident in the Civil War, where by the way the enemy were very uncivil in annoying us in every way. We had been in a few such engagements as the Wilderness, Spottsylvania and others when we halted at Milford Station, Va., for dinner. Capt. Kennedy had gone off to gossip, and I was the senior officer of the company present. We were gnawing hard tack, softened by good coffee, and chewing "beef dried on the hoof," not the "embalmed" article which Gen. Miles has recently described, when from a hill about half a mile away half a dozen of the enemy appeared with a light field piece, unlimbered and let us have three shells. I jumped up to form my men, but could not speak. The suddenness of the attack paralyzed the vocal organs for a moment, but the danger was not as great as in the engagements named, for a squadron of cavalry put the enemy, with their one gun, down the road in great haste.

That same day I was detailed to take a message to Lieut. O'Hare, commanding the picket line. It was near sundown, and the line lay through a swamp. The orders were not to challenge a man approaching our lines, but to shoot. There was no "countersign" in the immediate front. I found O'Hare and delivered the orders and started back, believing that I was within our lines. There was a bright flash and the song of a bullet. My heart seemed to stop and my tongue again clove to the roof of my mouth, and I dropped to the ground for safety and to learn the situation. Conversation between the pickets developed the fact that I had somehow got between the lines and was in front of my own men. Speech was then restored, and after that it was never lost if my comrades were correct in saying that when I was in command of the Color Company the colors could be located by my expletives.

This is instanced merely to show the effect of terror on the brain and heart. In early life I used language which I regard as ungentlemanly to-day, as it was the current conversation in the lead mines and on the frontiers, and in the excitement of battle I must have used improper epithets, for our Chaplain called me to task for it. In the cases above related the unexpected attack produced an effect which an expected one did not.

I have been told of rabbits dying from coming suddenly upon a man who yelled at them, and I can see how such a thing is possible. It is the shock of suddenness which paralyzes the heart and stops its action. This never happens with young birds or animals when taken in the hand; their sense of fear has not been fully developed, but with birds or animals of a highly nervous organization it is easy to believe that it may occur, and both the quail and the rabbit have delicate nerves. Such a death seems impossible in such fighting animals as foxes and hawks.

CHICAGO AND THE WEST.

What Ails Wisconsin?

Our friend, Mr. John Stevens, of Oshkosh, Wis., continues his exploitation of the prevailing methods in game and fish matters in the State of Wisconsin. Not wishing to make any specific criticism, he none the less has many facts to produce as to the violation of the fish laws, as well as the game laws. He has just returned from a trip over the muscullonge lakes of Wisconsin, and he tells my friend, Mr. Bortree, that the muscullonge are being shamefully destroyed in that region, and without any show of hindrance. He says that the spearing of muscullonge through the ice is a regular industry. Dynamiting is also regularly practiced. He adds a third and novel item of news in the statement that the muscullonge are in some localities baited with liver or other food which has been treated with a certain drug, probably Indian cockle (obtained from a Philadelphia firm), which stupefies them and causes them to come to the top of the water, although it does not render their flesh unfit for food, or at least for sale. He says that the guides and woods people are making a regular industry of this winter shipping of muscullonge. One ice fisherman shipped to the Pabst Brewing Co., of Milwaukee, according to Mr. Stevens' assertion, 105 muscullonge, for which he received \$105. It is a big and wild country, this lake region of Wisconsin, as I well know, for I have tramped over 200 or 300 miles of it in the winter time. Yet none the less these shipments of muscullonge all come out over two or three lines of railroads, and they can be traced to their source. What ails Wisconsin?

Minnesota Ice Fishers.

Major Jewel, of Wabasha, Minn., on the banks of Lake Pepin, sends me some news about ice fishing which seems to me to have a better ring to it than the item last above printed. It is as follows:

"Sunday, Game Warden Fullerton came down with five deputies and burned all the fish houses and nets from above Red Wing to Reads Landing on this side and also all fishing paraphernalia they could find. This is a move in the right direction, and it is to be hoped it will be followed up until there is not an illegal net or fishing outfit on the lake. If the fishermen were satisfied to use the sized mesh required by law and take only the coarse fish, it would be different, but they will not do that, and continue to take the small game fish as well. There are some of them that abide by the law and do not rob the lake of the game specimen. This matter has been allowed to run until it is almost impossible for a man to go out and catch a mess of fish in a sportsmanlike manner. Warden Fullerton and his party were well armed, and while they were not looking for trouble, yet they were ready for it if it came. They stopped at Hotel Lyon Saturday night, and Mr. Fullerton said this illegal fishing must be stopped, and he intended to keep right after them until there is not a net on the lake. Wisconsin intends passing a law that will protect their side of the river and lake, and if that is done there will be some fun in the near future."

1200 BOYCE BUILDING, Chicago, Ill.

Pickeral Fishing.

Boston, Jan. 28.—Pickeral fishing through the ice is in order, and live bait is at a premium. Generally there is very little snow to trouble in the vicinity of Massachusetts waters, and the ice is not specially thick. A remarkable catch was made from the Charles River the other day. Wallace E. Cobb, Stephen P. Hurd, Richard Delaney and Alexander Gordon, of Dedham, with Robert and Al. Reiley, of Boston, were the lucky captors of seventy-five pickeral. They fished Harrington Cove, on the Charles, a short distance from Dedham Village. They had to cut holes in the ice and get the lines in. It was one of those peculiar days for winter fishing—warm, with the wind just right. They fished four hours, with the results just mentioned. The string was weighed and made the fish average 1½ lbs. each, or about 108 lbs. of pickeral. Naturally, the fishermen are proud of their success, and were photographed with their catch. It would seem that the Charles is not yet "all fished out," as has so often been declared of late years, though how long it can stand such catches as the above is the question.

Good reports come from the pickeral fishermen in Maine. The ponds in Wayne are yielding some good strings to Lewiston and Auburn fishermen. Winthrop and Monmouth ponds are also being fished with good results. Pretty good pickeral fishing has been found at several points along the Androscoggin River during the recent warm days.

Jan. 30.—The weather was not kind even to good Dr. McAleer on Saturday. His fishing friends met him for the celebrated pickeral party on W. R. Albertson's private pond on that day, in spite of the weather. But with the mercury almost down to zero, and the wind blowing almost a gale, even pickeral fishing through the ice loses some of its charm. There were present Arthur W. Robinson, George C. Ainsworth, W. A. McLeod, F. L. Brown, Charles E. Lewis, C. A. Barney, Dr. A. R. Brown, Dr. D. M. Clapp, S. F. Johnson, H. W. Sanborn and W. T. Farley. These went from Boston on a special car. The Worcester contingent was composed of Mayor Rufus B. Dodge, Jr., ex-Mayor A. B. R. Sprague, Moses D. Gilman, Chief of Police J. M. Drennan, Sheriff Robert H. Chamberlain, John N. Akerman, Richard Healy, License Commissioner James Early, S. Hamilton Coe, E. H. Vaughan, John B. Ratigan, Daniel Downey, R. J. McKay, A. H. Stone, Fish and Game Commissioner E. D. Buffinton, George Richardson, George A. Burtis, C. W. Bowker and William R. Albertson. To these names must also be added the genial Dr. McAleer, the life of the party. Holes were cut, and the tilts set before the party arrived, and for a time there was fair fishing. But the noise of so big a party on the ice, in addition to the extremely cold weather, rendered the pickeral hard to lure. The results of the day's fishing were not large, but everybody was pleased. Continuous refreshments were served at the little fishing lodge on the shore of the pond.

Senator Charlie Bailey and C. H. Tarbox have made a day's fishing for pickeral at Stetson's Pond, in Boxford. The day was comfortable and suitable for the sport. But the perch were more interested than the pickeral. It took nearly half a day to get the lines in, in fact, for no sooner than a line was in when the flag would be up, and the fishermen had to run to see what they had got. Pulling up the minnow, it would be found to be scared and possibly dead; or occasionally a small perch would be taken. It was evident that the perch had the floor, or rather the water. The boys succeeded in getting fifteen pickeral with the day's fishing, and any amount of perch, some really big ones being taken. Tarbox says that he was never more tired in his life when night came, from the constant running from line to line, the flags being up. Boys in the neighborhood have made some good strings of pickeral from the same pond, and bigger strings of perch.

SPECIAL.

A Dream of the Night.

How true to life a dream is. Last night, while the thermometer was several degrees below zero, I saw myself with a fish pole standing on the shore of a beautiful sunlit lake. I was standing ankle deep in green grass. The trees that skirted the shore were loaded with verdure. Blackbirds were flying back and forth across the corner of the bay, and singing and clinging to the tulles. Not a breath of air was moving. The blue sky was unmarred by a single cloud. All was filled with a flood of sunlight, and the reflected heat in unsteady waves was dancing upward. Two strange men were a short distance away watching me. For a moment I looked at the pleasing surroundings and studied the water. A good throw from the shore was an old log. I stepped close to the water's edge and put a good sized chub on the hook and tossed it just over the log. Some one back of me said: "If there is a fish in this lake it is just there." There were a couple of waves on the water. I moved the bait a little, and then it plunged out of sight, and when the line tightened I pulled. The pole doubled up, and the fish hung right back. Said I, "Boys, come down here, I have got a good one," and as a man on each side of me was giving all kinds and any amount of advice, it commenced to come to me that I had had just such bites before, and I said that perhaps the darned thing might be a mud-turtle. Just then there was a wake on the water and a big paw swiped the air, and while the haw, haw, haws were being poured into either ear I gave a jerk which tore the hook from the turtle, and the chewed up bait came back and struck me in the face. Then I said something, I do not remember what. Now my happiness was gone. The pleasing view of the lake was fast going in the fading sunlight, and with the haw! haws! still ringing in my ears I rose up in bed. The cold air was sweeping through the north wall. I swept the frost from my moustache and jumped out of bed to shake down the stove—while the cold northwest wind whistled around the corner of the house.

MOUNT TOM.

A dispatch from Bucharest, Roumania, says that a pack of wolves, emboldened by hunger, recently attacked a monastery at Lopovean, in the Moldavian Mountains, and killed a friar.

The Kennel.

United States Field Trials.

The Champion Stake.

WEST POINT, Miss., Jan. 25.—*Editor Forest and Stream:* The Champion Stake had only four starters. Pin Money and Rowland were the first brace down Monday morning. The weather conditions were not favorable; there were showers occasionally on ground that was already well soaked. Pin Money started out at her usual great speed. She let up considerably in speed before the heat was over. On bird work she must have been off nose; she hesitated and was undecided on point work she did do; and failed to take advantage of game she ought to have pointed. She found three beavies and did some single bird work. Rowland was slow in getting up to his speed, but he maintained a uniform rate of speed and made up in judgment what he lacked in speed, as he found five beavies to Pin Money's three, and made more points on single birds than she. He handled his game in great shape. Rowland's strong forte is bird sense and finding and handling game. No dog he ran with (and he ran with the best) found more beavies than he, or made more points on single birds. While not as speedy as others that ran, he makes his speed count.

Joe Cummins and Dave Earl were the second brace. They were put down in quite a rain, that let up, but it showered more or less all the time they ran. The dogs found birds plentifully, and did good work on game. Both dogs made a flush or two on beavies that was excusable under the circumstances. On single birds Dave had some advantage, on beavies there was nothing to choose between them. Joe had the most speed and range when they quit, Dave showing the best judgment in hunting out the grounds. The work of the dogs was so nearly equal the judges wanted to see them down again when conditions were more favorable.

Three dogs, Joe Cummins, Dave Earl and Rowland, were left in second series.

Joe had a rest of over two hours, and went down at 4 P. M. against Rowland. Joe had some advantage in speed and range, and did some the best on game, though the bird work was close between them.

Joe proving the best, left him and Dave to go down on Tuesday morning. Instead of weather conditions improving, they were worse than when the dogs had met in first series. A downpour Monday night made the already wet grounds wetter. The wind had increased to a gale, and a fine cold rain fell most of the time. Joe pulled up very lame, and one of his forefeet and his ankle were very much swollen. Tuesday morning when called on to start he looked a 100 to 1 shot. Joe ran as though his life depended on the race, and made the best race he ran in Champion Stake, and was awarded the championship.

P. H. BRYSON.

Alabama Field Trials.

BIRMINGHAM, Ala., Jan. 20.—*Editor Forest and Stream:* I hand you herewith Derby and All-Age entries to the Alabama Field Trials Club:

Derby.

Fergy—G. B. Tyler's b., w. and t. setter bitch (Joe Dortch—Gyp Tyler).
George Dewey—T. H. Spencer's b. and w. pointer dog (Von Gull—Cameo).
Judge—John Fletcher's liv. and w. pointer dog (Love's Kent—Brook's Belle).
Trib's Tony—J. E. Cox's liv. and w. pointer dog (Kent's Tribulation—Byrne).
Alabama Boy—H. H. Mayberry's b. and w. pointer dog (Von Gull—Balsora).
Gullena—T. T. Ashford's b. and w. pointer bitch (Von Gull—Balsora).
Vor Rick—T. T. Ashford's liv. and w. pointer dog (Von Gull—Balsora).
Ina B.—B. Brook's (agt.) liv. and w. pointer bitch (Love's Kent—Brook's Belle).
Alix—Dr. R. S. Henry's liv. and w. pointer bitch (Jingo—Ripo).
Jewell—Dr. G. Chisholm's liv. and w. pointer bitch (Von Gull—Cameo).
Rap's Pax—Judge Tell Gaston's liv. and w. pointer dog (Rip Rap—Croxie Kent).
Glory—Dr. Geo. Eubank's b., w. and t. setter bitch (Tony Boy—Fanny Moore).
Froso—Mrs. Norma Allen's b. and w. pointer dog (Von Gull—Cameo).
Wheeler—R. S. Munger's b. and w. pointer dog (Tick Boy's Mack—Brook's Belle).
Jim O.—W. B. Townsend's liv. and w. pointer dog (Rip Rap—La Rosa Elgin).

All-Age.

J. J. O.—W. M. Hundley's liv. and w. pointer dog (Rip Saw—Crickett).
Kent Elgin II.—W. B. Townsend's liv. and w. pointer dog (Kent Elgin—Julia Paine).
Hessie D.—J. Thad Mullen's liv. and w. pointer bitch (David of Hessen—Fritz's Fay).
Lady Clio—W. T. Johnson's b. and w. pointer bitch (Cresswell's Frank—Lady May II.).
Tony Dick—T. H. Spencer's b., w. and t. setter dog (Tony Boy—Blue).
Nat—A. J. Odom's w. pointer dog (Von Gull—Hessie D.).
Greenbrier Rose—J. J. Odom's b. and w. pointer bitch (Rip Saw—Crickett).
Von Gull's Rube—Henry Arrington's liv. and w. pointer dog (Von Gull—Hessie D.).
Gullena—T. T. Ashford's b. and w. pointer bitch (Von Gull—Balsora).
Pot Metal—F. M. Stich's b. and w. setter dog (Tony Boy—Blue).
Mack B.—B. Brook's b. and w. pointer dog (Tick Boy—Ruffe).
Dot—Judge Tell Gaston's lem. and w. pointer bitch (Alto—McKenzie's Grip).

Rap's Pax—Judge Tell Gaston's liv. and w. pointer dog (Rip Rap—Croxie Kent).
Love's Kent—W. I. Love's b. and w. pointer dog (Kent Elgin—Mack's Juno).
Jingo's Light—Jno. B. Rosenstihl's lem. and w. pointer dog (Jingo—Rose Le Hussen).
Lou—B. Brook's (agt.) lem. and w. pointer bitch (—).
Maceo—Syd. Moore's liv. and w. pointer dog (Von Gull—Hessie D.).
Hamp—C. F. Eastham's liv. and w. pointer dog (Von Gull—Flake).
Spotty M.—T. W. O'Byrne's lem. and w. setter dog (Doncaster Sport—Fanny Mack).
Blue Dash—Dan Jenkins' b., w. and t. setter dog (Harry Blue—Kate Gladstone).
T. H. SPENCER, Sec'y and Treas.

Westminster Kennel Club Prizes.

NEW YORK.—The donor of the Dunollie cup for best Great Dane bitch in the show will not be a competitor. The conditions of the Tommy Tickle Challenge cup for bull terriers are identically the same as those governing the Dunston & Kennelly cup, as published in our premium lists. I have just received notification from Mr. John H. Matthews, acting secretary of the Bull Dog Club of America, saying that the special prizes offered by the Bull Dog Club of England are as follows: Silver medal for best dog. Silver medal for best bitch. Bronze medal for best dog bred by the exhibitor. Bronze medal for the best bitch bred by the exhibitor. These will take the place of the two specials published in our premium list, as offered by the Bull Dog Club of England. Mrs. Francis Henwood offers, through the American Spaniel Club, the Premier Challenge Puppy Bowl for the best cocker spaniel puppy exhibited by a member; to be won three times before becoming the absolute property of the winner.

The Swiss Mountain Kennels, Germantown, Pa., offer the Swiss Mountain Kennel Trophy for the best trio of cocker spaniels owned by one kennel or exhibitor. The trio to consist of one black, one red and one parti-colored cocker spaniel.

The American Spaniel Club offers silver medals as follows: For the best Clumber, field and Irish water spaniel opposite in sex to the winner of the Field Spaniel Trophy; best field spaniel with one of his get; best brood bitch with two of her produce; best field spaniel other than black; best black cocker opposite in sex to the winner of the Cocker Trophy; best black cocker with one of his get; best black cocker brood bitch with two of her produce; best cocker (any solid color other than black) opposite in sex to the winner of the Saybrook Cocker Trophy; best cocker (any solid color other than black) with one of his get; best cocker brood bitch (any solid color other than black) with one of her produce; best parti-colored cocker; best parti-colored cocker with one of his get; best parti-colored cocker brood bitch with one of her produce. The get and produce only to be considered in the prizes offered for stud dogs and brood bitches.

James Buckley Locherty, Esq., offers \$20 for the best exhibit of four Chesapeake Bay dogs owned and exhibited by one kennel or exhibitor. W. Gould Brokaw, Esq., will offer a Breeders' Challenge Cup for pointers, conditions of which I hope to be able to wire you in time for next issue.

Class 286, ruby spaniels, will be divided by sex.

The Butterfly Bench Show Association, of Grand Rapids, Mich., offers a silver medal for the best St. Bernard in our show.

O. P. Amend, Esq., offers \$10 for the best exhibit of four dachshunde, owned by a member of the Dachshund Club of America. JAMES MORTIMER, Supt.

Ripse .

THIS liver and white pointer bitch, whose portrait we publish in this issue, is famous in the competition of the Eastern Field Trials Club, she having captured first honors in a strongly contested Members' Stake two years in succession, 1897 and 1898, the first time in a field of fourteen starters, of which Mr. Lorillard's setter dog Roland was one, and the second time she defeated a field of eight. In form, she is symmetrically and substantially built, as her portrait shows. She works very pleasingly to the gun, and her work in pointing and locating is very clean, quick and accurate. Her position in the portrait was sketched from an actual point, made on the E. F. T. Club's grounds, near Newton, N. C., in November last. In breeding, she is by the famous Rip Rap, out of Dolly D. (A., 36,837, vol. xii.), she thus being a sister to India and Nabob, both famous in field trial annals.

Yachting.

As the yachting journal of America, the FOREST AND STREAM is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

THE plans for the new house of the New York Y. C. were placed on view at the club house last week and inspected by many of the members. The design selected by the committee is the work of Mr. Whitney Warren, of the firm of Warren & Wetmore, New York. Mr. Warren has succeeded admirably in planning a house fitting to the needs of the club, and to its position; as the building, when completed, will be far ahead of everything of the kind in existence. It is impossible to convey any adequate idea of the design, short of a lengthy description, accompanied by illustrations, for which space is lacking at the present moment. The old buildings on the site have been demolished, and the work on the foundations will shortly be started. Thus far the club has received nearly fifty thousand dollars in voluntary subscriptions from members toward the construction of the house, and

a very large portion of the cost will be met in this way, as the sum is steadily increasing.

MR. W. E. C. EUSTIS, of the Beverly Y. C., has challenged for the Quincy cup, and will build a 21-footer for the races. Mr. Eustis is well known in connection with the racing of the Beverly Y. C. on Buzzard's Bay, both as a skillful sailor, and as a careful and thoughtful experimenter in designing. His yachts Grilse, Capelin, Salmon and Cero have all been noted for the work he has done with them.

AFTER alterations in the melting pots, the lead keel of the new defender was cast on Jan. 24, and on Jan. 27 the mould and the earth temporarily surrounding it were removed, and the casting was finished off by planing. Materials for the new yacht are arriving almost daily at Bristol, the frames have been bent, and the work of erection will begin as soon as the bronze keel plate is bolted to the lead keel.

ACCORDING to reports from the lake papers, the Toledo Y. C., after preparing to build two yachts for the trial races of the Chicago Y. C., has decided to abandon the project, in view of the third clause of the conditions of the trial races, as published in the FOREST AND STREAM of Jan. 27. Objection is made to the reservation by the challenging club of the right to select other than the winner of the trial races as its representative in the cup races.

In so doing, the Chicago Y. C. has only followed a long established precedent in international racing, the trial races for the America Cup, and in the Seawanhaka and other smaller cups being conducted on this basis.

The object of such trial races is to enable a challenging or defending club to select the best possible yacht for certain other races, perhaps in another locality and under very different conditions from those of the trials. It is quite possible that a really superior boat may make an indifferent showing in the trial races through causes which are apparent and capable of remedy before the main races; and again, though a yacht may win the trial races on her merits, it may be evident that she is really less fitted than some other of the fleet for the final races at a distant point. The selection of a representative is often a difficult matter, throwing a heavy responsibility on the committee, and unless the boat chosen has won every trial race, there are almost always complaints of favoritism.

In the present case the trial races will be held on Lake Michigan, at Chicago, while the final races will take place on Lake Ontario, at Toronto. The main object of the racing is to win the Canada cup at the latter place, and it rests with the Chicago Y. C. to make the fairest and wisest selection from the whole showing of the trial races, and not from the actual record of wins in the series.

The Steam Yacht as a Naval Auxiliary.

BY W. P. STEPHENS, ESQ., ASSOCIATE.

Copyrighted by the Society of Naval Architects and Marine Engineers. Published by permission.

THE conditions under which the members of this society meet for this, the sixth time, are very different from those of former years, and of such a nature as to test, in a measure, the value of the work thus far accomplished. Heretofore both papers and discussions have been largely of a theoretic and speculative character; far removed from war in the past, and with no immediate indications of it in the near future, the great problem of naval warfare has of necessity been treated almost from an academic standpoint. In describing and discussing the vessels, armor, and guns of the new navy, the most that has been possible was to conjecture what they might do if put to trial. To-day we are in a position to discuss what they have done, to test by the practical work of the last six months the theoretic work of this society for the previous five years. It is interesting to note that the weakness of our navy, the imperfect preparation for such an emergency as is likely at any time to confront the most peaceful nation, the imperative necessity for work in various lines of defense, that have only recently been realized by the nation at large, have been among the most prominent topics of discussion at all the meetings of the society, coupled with many practical suggestions and urgent demands for action.

The subject of this paper is but one of many that have already come before the society in their theoretic aspects, and now, when tried by practice, it presents results which seem to be both definite and conclusive; and from which some useful lessons may be drawn.

The work of reconstruction which has been under way in the United States Navy for the past fifteen years has been limited almost entirely to the strictly fighting arm of the service—the battleships, cruisers and torpedo craft. Indispensable as they are, these of themselves do not constitute a perfect navy; in fact, they are of comparatively little use without a large attendant fleet of auxiliary craft: transports, colliers, water boats, repair ships, supply ships, hospital ships; and small craft for various uses.

The condition of the Navy at the outbreak of hostilities between the United States and Spain may be briefly summed up as strong in its personnel; comparatively strong in fighting vessels, guns and armor; and absolutely unprovided with auxiliaries of all kinds. Of all the urgent work demanded both ashore and afloat, nothing was more immediate and pressing than the creation of an efficient fleet of auxiliaries.

Among the numerous classes coming under this general head is one that is hardly accorded the distinction of a specific title in naval programmes, but which, in the present case, was needed for three important uses, as follows:

First—For sea service as tenders to the blockading fleet, and general service in the shoal harbors and rivers of the West Indies, where the war vessels were barred by their draft.

Second—For picket duty offshore, constituting the "second line of defense."

Third—For harbor patrol duty in connection with the guarding of mine fields and the enforcing of the war regulations governing ports and harbors.

The preparation of this particular branch was but one detail of the important task entrusted to the "Naval Auxiliary Board," specially created at a time when the possibility of war had almost crystallized into a certainty. This board proceeded at once to examine a very large number of vessels, ranging from the large passenger steamers of the American Line down to the smaller sizes of tugboats and yachts; and, in accordance with its reports, vessels were purchased from the special appropriation made by Congress for the purpose of defense.

For the work above outlined two classes of vessels were selected, the ocean-going tug and the steam yacht, the latter to the number of twenty-seven. The selection was made from many localities, several of the yachts coming from the Great Lakes. The vessels were mainly purchased direct from the owners, the price being fixed by the Board. As soon as the transfer of title was completed the yacht was delivered at the nearest navy yard, where the work was pushed as rapidly as possible. As a matter of course, the majority of the yachts hailed from New York, and the work on them was consequently executed at the Brooklyn Navy Yard.

The general nature of this material for an emergency fleet is shown by Table I. in the Appendix. Its capabilities for successful conversion to war purposes were, as we shall see later, not of the best; but the facilities for carrying out the work were in the main satisfactory, the skilled labor and the necessary material being readily obtained. The only difficulty encountered in this part of the work was in the detail of armament, there being a lack of some of the sizes of guns best fitted for these small vessels. The general character of the work is shown by Table II.

To the yachtsman at least, the sight of the well-known vessels as they left the Navy Yard was a surprise and also a shock; under a dull monochrome of "war paint" (lead color) covering everything from waterline to truck, the distinctive color scheme of the yacht was effaced entirely; there was no longer a trace of the green "boot top," the jet black topsides relieved by gilded cove and trail boards and figurehead, with the sheer cut out cleanly by a strip of polished teak. The rich brown of the deck houses, the bright yellow of the spars, and the white sails set off by the parti-colored burgee at each truck, had all disappeared. The bowsprit was sawed off just outside the gammon iron and brought to a blunt point; the fore topmast shared a similar fate, projecting but a few feet above the cap, and the mainmast had disappeared entirely. A pair of three or six pounders grinned menacingly from the forecabin, a couple more from the quarterdeck, and bridge and deck house each showed an automatic gun. The rowing boats were retained, but the steam and naphtha launches were left ashore.

As each vessel was completed she was dispatched to her station, many going direct to Key West, and from there to the Cuban coast; others were stationed along the coast of the Eastern and Atlantic States to give warning of the approach of the expected Spanish fleet, while the smaller ones were assigned to duty in the harbors of New York, Boston and other important seaports. At the outset the sea picket division was regarded as the most important of the three, but as matters turned out it had nothing to do, and after Cervera's fleet took refuge in Santiago Harbor it was withdrawn and the vessels dispatched to more southern stations. The work of the harbor patrol fleet was also very light, mere policing of the mine fields against the intrusion of garbage scows and coasting schooners.

While specific information as to the individual performances of the main division of the yacht fleet in actual service is not yet at hand, enough is known to establish the fact that the fleet, as a whole, acquitted itself creditably and fully justified its creation. While some of the converted yachts proved failures and entirely unfit for sea work, and others were only partly satisfactory, many of them have done excellent work under trying conditions. The part played by the Gloucester and the Vixen at Santiago was such as to bring them into special prominence, but the Mayflower, Yankton, Scorpion and others have done regular and consistent service, though under conditions which have attracted less attention to them.

The work of laying up this fleet really began before the actual cessation of hostilities, the smaller yachts of the harbor patrol being withdrawn and placed out of commission at the Brooklyn Navy Yard and other points. One yacht, the Free Lance, presented to the Government by her owner, F. Augustus Schermerhorn, Esq., without conditions, was returned to him as soon as the need for her services in the New York harbor patrol fleet was over. Another similar gift, the Buccaneer, presented by W. R. Hearst, Esq., was also returned later on, being in Cuban waters when hostilities ceased. At the time of writing, most of the yachts have returned from the West Indies, the majority of these to go out of commission. The Gloucester, Scorpion, Vixen, Mayflower and others of the larger and abler are still in service. One yacht, a new craft uncompleted at the time of purchase and placed in commission only after the need for her was past, has been reserved for the special use of the President, a service heretofore performed by such Government tugs, light-house tenders, or other small craft as were temporarily available. She has been named Sylph, and her original arrangements as a private yacht have been modified to suit this new use. No decision has yet been made as to the disposal of the yachts remaining, twenty-five in all, but it is probable that most of them will be offered for sale, ultimately returning to the pleasure fleet.

In summing up what has been at best an experiment arising from an emergency which should never have occurred, it may be said in regard to the home divisions of the converted fleet, the sea pickets and harbor patrol, that the course of the war has been such that no serious or prolonged service was required of either, and the merits of the fleet was not put to a practical test. Had, however, the anticipated attack upon the North Atlantic coast proved a reality, it is safe to say that the yachts would have met all expectations. In the case of the third division of the fleet, the vessels were put to the severe test of prolonged service at sea, under conditions for which they were never intended, and they were also engaged in

attacks upon land fortifications, and in some cases in engagements on the sea. The result of this test has been, on the whole, quite as satisfactory as could have been expected.

The possibilities of the yacht fleet at the present time for conversion to war uses were, even from a theoretic standpoint, far from promising. Many of the vessels were ill-fitted in model for real service at sea; there was a lack of displacement for the added weights of armament and ammunition, of berthing space for crew, of bunker space, and suitable locations for magazines. The nominal speed, in many cases low in itself, was not realized even in smooth water, and in a sea there was a serious loss of the average working speed. There was no protection, no distilling apparatus; the capacity of the water tanks was generally inadequate, and the decks were not designed to withstand the shock of the guns. The draft as a rule was greater than was necessary or desirable. The nature and extent of these defects were fully realized at the outset, but under the circumstances there was no other course but to take the yachts as they were and to make the best of them. All things considered, they have done their work quite as well as was to be expected; they have served a certain necessary purpose, and they were capable of doing even more had it been required of them.

It is to be hoped that some of those who have had actual experience on board of the yacht fleet will tell us in the discussion the results of their personal observations, which cannot fail to be interesting and of permanent value; but, short of this, enough is now known to permit of a discussion of the future position of the yacht fleet as a naval auxiliary.

It is impossible within the limits of the present paper to discuss the auxiliary fleet as a whole; but to those of us who have followed the discussions of this society year by year the experiment must be an interesting one. The lessons to be derived from it are, first, the necessity for timely preparation in the speedy building up of an adequate navy; and second, that to be done properly, this work must proceed for a term of years according to a comprehensive and systematic programme, completed in advance and carried out as nearly as possible without change through successive administrations. A reference to the Transactions of the Society will show that these two points have been emphasized in the course of almost every discussion of the naval papers.

The detail of the auxiliary fleet now under consideration, the yacht division, has, as I shall endeavor to show, a special lesson of its own; that the naval programme may be advantageously extended to include a type of small auxiliary indicated by the yacht, but not now in existence in this country.

The present use of the yacht fleet being confessedly but an emergency measure, the question naturally suggests itself as to whether such a course would have been necessary had our navy been theoretically complete in all of its branches; notably, had the gunboat and torpedo arms, instead of being exceedingly weak, been developed to the same extent as in other navies?

This question may at once be answered in the affirmative, for the reason that none of the vessels of the gunboat or torpedo boat types are adapted for the special service demanded of the converted yachts. The high speed which is the leading motive of torpedo-boat design is not only needless for the work now under discussion, but entails the loss of many essential qualities. Incidentally, it may be observed, there has been, with the exception of one yacht, Mayflower, no attempt to convert the yachts into torpedo boats; and had there been enough torpedo boats at hand for this service, the only available crews, largely made up from the Naval Militia, would have been unfit to handle them.

Assuming, then, that however perfect the torpedo arm may be, there is still a distinct field of usefulness for something of the yacht type, we come to the question discussed at the first meeting of this society in 1893, of the policy of reliance upon the pleasure fleet as a regular means of defense in the future.

The suggestion has been made in this connection that some scheme of co-operation between the Government and individual yacht owners might be put into practice whereby, in return for certain privileges or compensations on the part of the former, the latter might be induced to plan any new yachts with a direct view to their conversion to war uses. The objections both to this method of procedure and to the general policy of reliance on the yacht fleet are very strong. On the part of the Government, the only effective inducement to be offered to the owner must be in some form of subsidy, a sort of special legislation which is practically impossible. On the part of the owner, his personal requirements, to say nothing of the wishes of his captain, his wife, and his friends, are directly opposed to those of the war vessel. There is, it is true, a common ground whereon the owner and the Government might come together to mutual advantage in demanding the essentials of good design, a seagoing model, fair working speed, ample bunker space, etc., but in too many cases these are but secondary to the demand for spacious saloons and lavish display of furnishings. To the owner who is willingly paying a very large sum for mere luxury and elegant appointments, the Government can offer but slender inducements to make his vessel a ship first and a palace afterward; or, when completed, to loan her for a time as a practice ship, as has been suggested as one feature of the scheme.

Unless very much more can be done in this direction than now seems possible, the experience of the present year is such as to indicate that the purchase and conversion of yachts is in every way undesirable as a permanent feature of naval policy. The defects of the existing fleet have been already indicated, many of them are mere matters of faulty design, due to the haphazard methods that have thus far largely prevailed in this country, the owner leaving everything to his captain, who in turn deals directly with a builder. This class of defects will largely disappear as soon as the American yacht owner awakens to the appreciation of the importance of the trained specialist, the yacht designer, in the field of steam yachting, as he has long since done in that of the sailing yacht. At the same time the good qualities of a perfect steam yacht are not of necessity such as to make her an ideal picket or patrol boat; and of the fleet available at any future time for conversion, many will be

found to possess positive bad qualities, as in the present case.

As a matter of permanent policy, however, the question of the efficiency of the converted yacht is but secondary to that of the cost, always a controlling one in a naval programme. The circumstances attending the purchase of yachts for this purpose are necessarily such as to keep the price at a fair figure, and this price represents a large amount of furniture and decoration which is worse than useless, as its very removal entails some expense. Apart from this waste, the yacht needs to be strengthened for gun mounts, etc., and remodeled in all the internal details. When the emergency is passed and she is no longer needed, her value as a yacht will have seriously depreciated, and the work of reconversion must be far more costly than that of the first change, as its details are reversed. Where the furnishings were hastily stripped at a mere cost of labor, new ones must be purchased and put in place; where spars were simply sawed off, new ones must be made and shipped; and in place of a plain coat of lead color over everything, regardless of appearance, the entire structure must be scraped and redecorated by skilled artisans. When the present experiment has reached its final stage in the sale of many of the yachts, and the result is reduced to plain dollars and cents, there will probably be little room for doubt as to the unprofitable nature of the work.

While the actual co-operation of the Government and the yacht owner is hardly practicable, each may study with profit the lesson now before them.

It is obviously to the interest of the Government to encourage the building and use of yachts; apart from the indirect advantages of a national pleasure fleet, there is always the possibility of an occasion like the present, when the larger vessels must be depended on as a *dernier ressort*. While nothing can be done in the way of direct financial aid, it is a wise and sound policy to encourage yachting by the removal of all unnecessary and oppressive regulations.

On the part of the owner, it must be apparent to him now, if never before, that his interest lies directly in putting his money into a vessel that as far as possible possesses the prime essentials for conversion to war use. It may happen, as in this case, that the opportunity to sell her at a fair figure is coincident with a temporary inability to use her on account of war. How far he can go in the compromise between his individual requirements and adaptability for conversion is a question to be settled with his designer; but he will hardly fail to realize that it is too important a matter to be disregarded entirely, as it has been in the past.

A careful study of the history of the yachts in the present war will show two important points: first, the theoretic value of vessels of the yacht type; and second, the limited extent to which the yacht fleet as a whole has realized in practice its theoretic efficiency. The work demanded and in part accomplished by the yachts is not properly within the field of either the gunboat, the destroyer, or the torpedo boat. The former is too large; the torpedo vessels, of all classes, are designed mainly for a speed which not only is absolutely unnecessary for this special work, but is obtained through the sacrifice of essentials.

The gunboat class in the new navy had its origin in the Petrel, built in 1887, of 850 tons displacement, 11 ft. 7 in. mean draft, and 11.5 knots speed; a vessel now notable from her part in the battle of Manila Bay. The development of this class since then has been entirely upward, to vessels of 1,700 tons displacement; and no attempt has been made to carry it downward from the Petrel. Useful as they are, the gunboats now in service and the new ones under construction are unfitted by their size for the work assigned to the yachts.

So far as the torpedo boat is concerned, the present war has been devoid of results; not only is the question of the true relative value of the torpedo fleet as much an open one as it was a year ago, but false lights have been thrown on it (through the poor performance of the Spanish destroyers, and also the good work of the converted yacht Gloucester) which are calculated to mislead at least the popular mind. It cannot be too strongly stated that the idea, quite widely prevalent, that one converted yacht is the equal of two of the modern torpedo boat destroyers, is entirely erroneous. The destroyer and torpedo boat are to-day quite as formidable as they were a year ago, quite as essential, and with a wide field of usefulness on which nothing of the yacht type can intrude. At the same time, their limitations are numerous and well defined; they are necessarily most expensive and delicate machines, lacking protection, armament, bunker space, and crew accommodation; they demand special picked crews, whose endurance is severely tested in comparatively short trips at sea; and they are at all times liable to speedy deterioration. The value of each individual boat depends mainly on the spirit and training of her crew, and her excess of speed above others of her class. Had there been at hand this spring an ample fleet of torpedo boats, they would have been of but little use for the reasons that the trained crews to man them were lacking, and the men who were available, largely from the Naval Militia, were incapable of handling such delicate tools.

The work of the yachts, their success and failures taken together, with the work of other small craft such as tugs, lighthouse tenders, etc., impressed into the same service, seems to indicate the desirability of the creation of a new type of small auxiliary not at present recognized on the navy list. The controlling feature of design—the speed—may at the outset be placed at a moderate figure for this era of increasing speeds, not over eighteen knots. This, however, is not to be measured by the conventional yacht standard, by which an eighteen-knot steam yacht takes the wash of a good twelve-knot tug, but means a reasonable approach to the designed speed under ordinary service conditions at sea, and the ability to keep with the fleet even in bad weather. The model should possess seagoing qualities of the highest class; the draft should be limited to 11' or even 10 ft. as a maximum; the construction should be durable, with ample scantling both to carry the armament and to insure a long life with ordinary care in laying up; the engines should be strong and reliable, the bunker space as large as possible, and as deck and side protection will probably be impracticable, especial attention should be

given to the waterline protection of machinery and magazines through their location and the disposition of the bunks. The accommodation should include healthy and comfortable quarters for a proportionately large complement of officers and crew for an indefinite time, and the armament should be comparatively powerful, with the guns more advantageously located than is possible on a yacht. Special provision should be made for magazines, ammunition hoists, distilling apparatus, and minor auxiliaries. There should be no sails, and no spars except the single military mast, and in all cases torpedo tubes should be excluded. Profiting by one serious defect of the yachts, special attention should be directed to the disposition of space in holds and bunks so that it may be utilized to advantage without a material change of trim.

The intended uses of this class call for three sizes: for sea work, as dispatch boats and tenders, and for picket duty, vessels of not over 800 tons displacement, about the size of the Gloucester and Scorpion, the draft not exceeding 11 ft. in a single screw boat; twin screw boats of this size with draft reduced to 9 ft. would be very serviceable, as proved in the present case, for harbor and river work. The next size to be of about 400 tons displacement, about the size of the Hist, Eagle and Hornet, twin screw vessels of 7 to 8 ft. draft, intended for sea service as pickets. The third size, for harbor patrol service, to be of about 200 tons and 6 ft. draft, designed for smooth water, carrying a light armament and limited supply of coal. A speed of fifteen knots would suffice for this service, but they should be capable of towing a vessel out of possible danger.

The requirements here set forth are in a general way but the theoretic qualities of the converted yacht, not fully realized now in any one vessel, but easily obtained in a special design. To the specialist in torpedo-boat design or to the yacht designer the problem would be a simple one. On the one hand, the demand for very high speed, approaching thirty knots, with its egg-shell construction and numerous limitations, is entirely eliminated; and on the other the numerous and conflicting requirements of the private owner as to amount and disposition of space are replaced by fewer and simpler ones. A vessel of this type could be built for far less than either the torpedo boat or the converted yacht; she would fulfill her own special mission, covering a very wide range of usefulness, better than either; she could be handled to advantage by the average crew, not necessarily experienced men; she could, when not needed, be laid up for an indefinite time, ready for service at a few days' notice; and when thus laid up she would not be subject to the double deterioration of the torpedo boat; physical in the actual disintegration of her light frames and plating, and technical in the outbuilding by vessels of newer design and higher speed. As practice vessels for the Naval Militia for short intervals in the summer, a purpose for which it has been suggested yachts might be borrowed, these vessels would be superior to either the yacht or the torpedo boat. They would carry a larger number of men than the torpedo boat, their armament of 4 in., 5 in. and 6-pounder rapid fire guns would be better suited for practice than the two extremes of the torpedo and the 1-pounder; and while the larger sizes would be capable of practice cruises at sea, the smaller with their limited draft would be well adapted for such work as the exploration and study of local waters, as now carried on by the Naval Militia.

With suitable designs once completed for each size of vessel in the class, there would be no necessity to modify them with each new improvement that gives speed; and the attention of the designer might be concentrated upon the perfecting of details and such a reduction of engines and other parts to established standards as would minimize the cost of construction, and also make it possible to add to the class very quickly in the case of an emergency.

An examination of the smaller types of gunboats in use by other nations would disclose many interesting points; but it is not necessary to go outside the immediate experiences of the past six months for several important conclusions. The conditions of coast defense, as thus indicated, involve certain work which is not within the legitimate field of the existing gunboat class, or of the high speed torpedo boat; and which can only be done imperfectly and at great expense by means of the conversion of the steam yacht. A special class of vessel fully fitted for this work can be constructed at a comparatively moderate cost; and once provided in sufficient numbers, can be laid up for an indefinite time in a condition for almost immediate use.

In venturing to present these conclusions to those who have enjoyed more extended opportunities for observing the present fleet in actual service, I earnestly hope that they may deem them worthy of their attention and criticism.

YACHTING NEWS NOTES.

The annual meeting of the American Y. C. was held on Jan. 17 at the Waldorf-Astoria, the following officers being elected: Com., Charles A. Gould; Vice-Com., J. Murray Mitchell; Rear-Com., George W. Quintard; Sec'y, Thomas L. Scoville; Treas., W. Porter Allen; Fleet Surgeon, Dr. Charles I. Pardee; Meas., Howard Willets; Consulting Engineer, George W. Magee, U. S. N.; Trustees for two years, H. de B. Parsons, E. H. Weatherbee and William H. Beers.

The following nominations for officers of the New York Y. C. have been posted; the annual meeting takes place on Feb. 9: Com., J. Pierpont Morgan, steam yacht Corsair; Vice-Com., Lewis Cass Ledyard, schooner Montauk; Rear-Com., August Belmont, sloop Mineola; Sec'y, J. V. S. Oddie; Treas., F. W. J. Hurst; Meas., John Hyslop; Fleet Surgeon, Morris J. Asch, M. D.; Regatta Committee, S. Nicholson Kane, Chester Griswold and Irving Grinnell; Committee on Admissions, C. Oliver Iselin, Lewis Cass Ledyard, Henry C. Ward, W. Butler Duncan, Jr., and James A. Wright; House Committee, Tarrant Putnam, Edward F. Darrell and Frank M. Cronise; Library Committee, Fordham Morris, Arthur H. Clark and Theodore C. Zerega; Committee on Club Stations, William H. Thomas, Frederick H. Benedict, F. August Schermerhorn, L. Vaughan Clark, Tarrant Putnam, Frederick P. Sands, Harrison B. Moore, John P. Duncan, Amzi L. Barber and Edward R. Ladew.

The Corinthian Y. C., of Philadelphia, at its annual meeting on Jan. 11 elected the following officers: Com., Alexander Van Rensselaer, steam yacht May; Vice-Com., Joseph de F. Junkin, schr. Columbia; Rear-Com., Robert M. Riddle, yawl Spalpeen; Sec'y, Addison F. Bancroft; Treas., Robert K. Neff; Meas., G. Herbert Millett; Race Committee, Addison F. Bancroft, Isaac W. Jeanes, Henry S. Jeanes; Committee on Admissions, Charles H. Brock, Alexander Van Rensselaer, G. Herbert Millett, Frank H. Rosengarten and Brereton Pratt; Trustees, elected to serve three years, William L. Elkins, Jr., Brereton Pratt, Alfred C. Harrison and George E. Kirkpatrick. The club voted to retain its station at the present location, Essington.

Mr. H. C. Wintringham has designed a centerboard schooner for a New York yachtsman, the dimensions being: Over all, 68ft. 8in.; l.w.l., 48ft.; beam, 16ft. 8in.; draft of hull, 7ft.; depth, 7ft. 10in. He has also designed a centerboard cutter 48ft. over all, 34ft. l.w.l., 13ft. 6in. beam, and 5ft. 10in. draft, with pole mast, which is building by the Greenpoint Basin and Construction Co.

The Spalding St. Lawrence Boat Co. has recently equipped its shops at Ogdensburg, N. Y., with electric lights and is now running ten hours per day. Heretofore the working hours in winter have been limited to daylight, about seven hours, but the added business has called for an increase, which is now possible. The firm is building a 30ft. gig, 26ft. lifeboat and 20ft. cutter for the steam yacht Corsair, Com. J. P. Morgan, New York Y. C.

The cabin naphtha yacht Paul Jones left Louisville Ky., early in December on a long cruise down the Mississippi and across the Gulf of Mexico to Florida. The party on board included Col. H. C. Yocum, of St. Louis, Miss Florence Yocum, Miss Marjorie Woodland, of Chicago, Miss Florence Taggart, of Indianapolis, and Mr. Joseph Brinkman, with a crew of three. She reached New Orleans in safety and started on Jan. 3 for Pensacola, but was not reported in any way until Jan. 20, when a party of fishermen brought word to Mobile of the finding of a wrecked yacht near Bird Island, on the Louisiana coast. The first reports were confirmed by the United States Lighthouse Tender Pansy, and other searching parties. Nothing has been heard of the passengers or crew, and the idea is generally accepted that the yacht was wrecked by an explosion, in which all were lost.

On Jan. 20 Mr. C. H. Crane delivered the first of a series of four lectures on naval architecture before the Seawanhaka Corinthian Y. C. The second lecture is announced for Jan. 31.

Mr. Theodore E. Ferris, head draftsman for Mr. A. Cary Smith for the past seven years, has associated himself with the firm of Joseph Thomas & Co., of Winans Cove, Md., taking charge of the marine department. The firm builds yachts and commercial vessels of all kinds.

The Greenport Basin and Construction Co. is busy with a number of yachts, including three keel sloops of 25ft. l.w.l., two cutters of 30ft. and one of 34ft. The two 30-footers are from designs by C. H. Crane, one being for J. R. Maxwell, Jr., and the other for H. D. Pratt, of Brooklyn. They are 43ft. over all, 10ft. 3in. beam and 7ft. draft. Two of the 25-footers are from designs by T. W. Brigham, for E. T. Nugent, of St. Louis, and H. L. Coe, of New York. They are 39ft. over all, 10ft. beam and 6ft. draft. The other is 37ft. over all, 9ft. 3in. beam and 6ft. 6in. draft.

We understand that Mr. H. C. Folkhard, author of the standard work on "The Sailing Boat," is now at work on a new edition, which will be materially extended and revised to include the most modern craft. Judging from the original work, published many years ago, the new edition will be a material addition to yachting literature.

On Jan. 24 the steam yacht Nourmahal, J. J. Astor, was hauled out for cleaning and painting, preparatory to a Mediterranean cruise, at Downing & Lawrence's Marine Railway, South Brooklyn, when the hauling chain parted and the cradle ran rapidly down the ways, launching the yacht suddenly and forcibly. She ran across the channel and came in collision with the working schooner Robert A. Snow, smashing her rail and springing her foremast, the total damage amounting to about \$500. But little damage was done to the yacht.

Memory, fin-keel sloop, has been sold by W. N. Murray to J. E. Fletcher, of Providence, through Manning's Agency. Terrapin, auxiliary schooner, has been sold by E. J. Bergen to J. G. N. Whittaker, of Philadelphia, by the same agency.

Canoeing.

CANOEING NEWS NOTES.

The organization of the Western Division of the American Canoe Association was finally completed at a meeting at Milwaukee on Jan. 23, at which Com. Thorn and Vice-Com. Morse of the A. C. A. were present, with officers of the Western Canoe Association. The following Division officers were elected: Vice-Com., Harry B. Cook, Chicago; Rear-Com., W. C. Jupp, Detroit; Purser, D. H. Crane, Chicago; Ex. Com., A. W. Friese, Milwaukee.

On Saturday, Feb. 11, 1899, at 6:30 P. M., a dinner will be given at Young's Hotel, Boston, under the auspices of the Eastern Division of the A. C. A. The dinner will be entirely informal, and the price will be \$2 per plate; a special entertainment will be provided. The committee hopes that all members of the Division, particularly those who have not attended the annual meets will make a special effort to be present, and thus, while co-operating to insure the success of this, the first mid-winter dinner of the Division, may become better acquainted. Guests may be invited at the regular price. Kindly notify the purser if you intend to come, stating the number of guests, if any. Committee, J. W. Brown, ex-officio, Innitou Canoe Club; J. B. Waterbury, ex-officio, Newton Boat Club; R. H. Hammond, Tatassit Canoe Club; F. A. Wallace, Lawrence Canoe Club; A. T. S. Clay, Wawbewawa Canoe Association. Wm. W. Crosby, Purser, No. 8 Court street, Woburn, Mass.

DRIVERS AND TWISTERS.

The programme of the Worcester Sportsmen's Club, Worcester, Mass., to take place Feb. 22, is now ready for distribution. There are twelve events at targets, no handicaps and nobody barred. There are five events at 10 targets, 70 cents entrance; one at 5 pairs, \$1.20 entrance; three at 15, \$1.30 entrance; two at 20, \$1.40 entrance; angles regular, unknown and reverse. The seventh event is the team race for the Shooting and Fishing trophy, 50 targets per man, of which 30 are singles, expert rules, and 10 pairs, entrance \$3, between the Worcester Sportsmen's Club and the Boston Shooting Association. Shooting commences at 9:30; regular programme at 10:30. Take Greendale electric cars for grounds, and stop off at Huntington avenue. Guns and ammunition sent care of Mr. A. W. Walls will be delivered at the grounds free.

Under date of Jan. 28 Mr. C. H. Manahan, of South River, N. J., writes us as follows: "There will be a 100-live-bird match on the grounds of the Middlesex Gun Club, this place, on Feb. 4, at 1:30 P. M., between John C. Belloff, 28yds., and Capt. Bunk, 30yds., both of New Brunswick. If stormy, the shoot will be postponed till Feb. 8, at 1:30 P. M. On Lincoln's Birthday, Monday, Feb. 13, there will be sweepstake shooting all day. The principal event will be a 15-bird handicap, 33 to 25yds., \$7 entrance, birds extra, at 1:30 P. M. Prizes will be given to the two high guns in this event. Stages will meet all trolleys from New Brunswick at Tanner's Corners on days of both shoots."

Mr. John G. Smith, president Iowa State Association for the Protection of Fish and Game, under date of Jan. 23 writes us as follows: "The meeting of the Association will be held at Algona, Ia., on May 23-25. We have a very large gun club in Algona, and the boys are already at work. We expect to make this one of the great meetings of 1899. We have fine grounds close to town, where we can shoot, rain or shine."

Mr. Elmer E. Shaner, manager of the Interstate Association, returned to Pittsburg, Pa., after a visit of some days in New York, where he had been some days attending to matters concerning the Grand American Handicap. He was quite sanguine over the prospects of the greatest of America's shooting events, as indeed he well might be, for every indication points toward a most complete success.

The tournament of the Sportsmen's Association, the programme of which is published elsewhere in our columns, offers shooting opportunities for visiting sportsmen under the most unique conditions. To shoot in competition on the roof of Madison Square Garden is an opportunity never offered before. The programme in itself is most attractive, and considering the quality, prestige, etc., is inexpensive.

There is rumor of a match between Councilman John Heflich, of West Hoboken, and Mr. Al Heritage, of Jersey City, for a supper and the price of the birds. On the same day the tie between Messrs. Henry Heflich and John H. Outwater at 25 live birds will be shot off. This was a result of a match at 25 live birds between Messrs. Harms, Heflich and Outwater, who killed respectively 20, 21 and 21.

The programme of the all-day target shoot of the Lyndhurst Shooting Association, Lyndhurst, N. J., has eight events at 15 targets, \$1 entrance; one at 25 targets, \$1.50 entrance. The fifth event is the State championship, the E C cup contest. The grounds can be reached in thirty minutes from New York either by the Erie to Rutherford, or D., L. & W. to Lyndhurst.

John Wright, manager of the Brooklyn Gun Club, is gradually perfecting the details of his forthcoming live-bird invitation shoot, to take place on Tom Morley's grounds at Lyndhurst, some time this month. No doubt it will be on the lines which Mr. Wright always observes, that is the most sport with the least expense to the shooters.

There was a little shooting at Elkwood Park on Jan. 27, consisting of five 4-bird short sweeps and a miss-and-out. Charles Woolley killed straight and won in the first sweep. Woolley and Daly divided the second. Woolley, Daly and Wood divided the third, and Woolley won the fourth alone. In the miss-and-out he won on the first round.

Owing to the contest for the E C cup and target tournament next Saturday, at Lyndhurst, N. J., the Boiling Springs Gun Club has postponed its monthly shoot from Feb. 4 to Feb. 11. The Brooklyn Gun Club, to avoid conflicting then with Boiling Spring Gun Club's date, has postponed its monthly shoot from Feb. 11 to Feb. 18.

On Saturday of this week the E. C. cup, emblematic of the championship of the State of New Jersey, will be contested, on the grounds of the Lyndhurst Shooting Association. Mr. T. W. Morley, the present holder, will defend it against Capt. A. W. Money, with what success no one at present can tell.

Some members of the Rochester Rod and Gun Club take quite kindly to live-bird shooting, as shown by some of the good scores made recently. No doubt other clubs are waking up to the importance and pleasure of this branch of sport, and perhaps also with an eye to representation in the Grand American Handicap.

Mr. J. R. Hull, of Parker Brothers, Meriden, Conn., was a visitor at the Brooklyn Gun Club shoot last Saturday. He has taken up live-bird shooting somewhat. His skill is quite equal to the demands of this branch of sport, so that he is of that rare class of shooters skillful on both targets and live birds.

Mr. Ed Taylor, the ballistic expert of the Laffin & Rand Powder Co., in discussing the best manner of illustrating the varied flight of the birds at Carteret last week, gravely said that the figures on a Chinese laundry bill would give about the best idea of the flights that it was possible to convey.

The Oceanic Rod and Gun Club, of Rockaway Park, Rockaway Beach, L. I., will shoot a team match with the Hudson Gun Club, of Jersey City, N. J., next Monday. Trains leave the foot of East Thirty-fourth street, Flatbush avenue, Brooklyn, station of the L. I. R. R. at 9 and 11 o'clock A. M.

The Dansville Gun Club, Dansville, N. Y., has arranged a series of shoots for a badge, the contests to be handicap events. Mr. Erskine H. Lott, on the totals for the month, won the January cup of the Crescent A. C.

Mr. Rolla O. Heikes left for his home, Dayton, O., on Friday of last week. He will return East about March 1 and make an extended visit in New York and vicinity.

The date fixed for holding the Pennsylvania State Sportsmen's Association's tournament has been changed from May 16-19 to May 30 to June 2, inclusive.

Mr. Thomas P. Hicks, who is the holder of the Chicago challenge trophy, has been challenged in due form by Mr. Silas Palmer, to compete for it.

The Soo Gun Club, of Sioux City, Ia., has claimed June 7 to 9 inclusive as dates for its fifth annual amateur tournament.

The Fremont Gun Club, Fremont, Neb., will hold an all-day shoot on live birds and targets, on Feb. 22.

BERNARD WATERS.

St. Paul Gun Club.

ST. PAUL, Minn., Jan. 28.—Under date of Jan. 28 Mr. H. C. Lawrence, secretary of the St. Paul Gun Club, writes us as follows: "The enclosed newspaper clipping will demonstrate to the shooting fraternity in Minnesota that in the future live birds may be shot at the traps without further interference from the humane society."

A few excerpts, taken from the clipping mentioned, are given herewith:

"It is more humane to kill pigeons by shooting them than to wring their necks or to cut their heads off." That is what John A. Moak, special humane officer of the St. Paul Society for the Prevention of Cruelty, said yesterday after witnessing at the State fair grounds the January live-bird shoot of the St. Paul Gun Club.

Officer Moak, Charles Steele, a former president of the society, and Michael Shorn, a policeman, were present to see for themselves if the sport of pigeon shooting from traps was really brutal, and to make arrests if warranted.

About thirty well-known trap experts of the Twin Cities congregated in the snowstorm at 11 o'clock to take part in the first shoot held in many a day by the St. Paul Club. The storm possessed few if any drawbacks to the hardy little band. Willing hands shoveled the snow away from the traps and the shooting box, and in a short time the sportsmen and Mrs. S. S. Johnston of Minneapolis, the only woman present to participate, were ready for business. Catamaran, one of the standbys of the club, was the first to burn powder. He was made No. 1 in the initial event, which was a sweepstake at 10 birds, unknown traps, and 28yds. rise.

Catamaran explained that he did not desire to lead off for any selfish motive, but to protect his friends from arrest, if any had to be made to satisfy the law. When the veteran called "Pull!" a

slate-colored towerer whirled skyward from the center trap. The sportsman's formidable looking fowling piece instantly was elevated to an angle of 35 degrees. There were two reports, one following the other almost instantly. The first barrel resulted in divorcing the tail feathers from the pretty pigeon, while the second did the "business," as an old hand expressed it to the eager spectators. The shot was a fine one. The bird expired almost instantly—was dead, in fact, when it reached the ground.

Officer Moak's eyes glistened with the keen appreciation of a genuine sportsman as he ejaculated, "No cruelty there!" Then the contest was resumed without interruption, about 200 pigeons being grassed.

Only two birds escaped, and according to Officer Moak, "they were not touched." He stood behind the participants as they faced the traps and took especial pains to note what happened to each bird. His colleagues were equally vigilant, and when the shooting was over they were equally positive with Mr. Moak that despite all that has been said against it, live-bird shooting is not at all cruel. Mr. Moak carried a bunch of fat pigeons away with him when he left for home.

Sweepstakes on live birds: First event—A sweepstakes, \$2.50 entrance, divided into three prizes: 28yds. rise, 50yds. boundary, 10 live birds each:

French	2222122222	10	Hirschy	2*22222222	9
Holt	1111111111	10	Mrs. Johnston	2*22*12221	8
Morrison	221122212	10	Gogel	2*21*1221	8
Catamaran	222212*12	9	C A Gill	2*1*121*2	7
Parker	22*222221	9	Newman	*11*22*11	6

First money was divided between French, Holt and Morrison; second between Catamaran, Parker and Hirschy; third went to Gogel.

Second event—Sweepstakes, \$2.50 entrance, divided into three prizes: 5 live birds each, 28yds. rise, 50yds. boundary. First money was divided between Smith, Jones and Jaffrey; second between Fonda, Perkins and Devereaux; third between Countryman and Folds.

Madison Square Garden Tournament.

A SYNOPSIS of the programme for the target tournament on the roof of Madison Square Garden, March 2-15, under the auspices of the Sportsmen's Association, is as follows:

This tournament is under the direct supervision of Mr. Elmer E. Shaner, manager of the Interstate Association. Mr. Shaner will be assisted by a committee composed of Messrs. U. M. C. Thomas, B. Waters and Edward Banks.

The intention is to hold an inanimate target tournament during the entire two weeks of the Sportsmen's Exposition, the scene of the tournament being the roof of the Madison Square Garden itself, which will be so arranged as to represent an actual tournament field. While the plan itself is decidedly original, and while the scheme is one that has presented many difficulties, everything now seems to be working smoothly, and there is every assurance that Mr. Shaner and his assistants will make a thorough success of the affair.

The programme will not be an elaborate one. There will be but two main events, with minor attractions as side issues.

The chief feature of the programme is the Sportsmen's Association inanimate target championship. This contest will be carried on throughout the entire tournament, the climax being arrived at on the last day of the shoot. It is proposed that contestants for the honor of competing for the championship and the trophies offered in this event shall "qualify" for such honor. In other words, shooters will have to classify themselves in the following manner: For qualifying in the championship event, shooters will be required to make records on 100 targets, the twenty or twenty-five men having the highest totals to their credit at the close of the last day but one of the tournament will be entitled to compete on the last day of the tournament in the 100-target event that will decide the disposition of championship honors and trophies. No one man can claim more than one total, so that there will be twenty or twenty-five men (as may be agreed upon by the management) who will be eligible for the final competition. The trophies will be worth winning, not only for their intrinsic merit, but also because the winners will have beaten some of the best shots in the country.

Another special feature will be what is known as the continuous match. This contest will be for trophies to be given to the shooters making the longest straight runs in the competition. No runs made outside this competition will be allowed to count. Nothing will be recorded save scores made in this competition. This is a thorough novelty and should be a popular contest with the shooters.

As in the qualifying contests for the championship event, re-entries will be unlimited, but only one score will be allowed to count for each shooter.

The management also proposes to donate medals or badges, or other suitable trophies, for distribution as follows: The shooter making the highest score on any one day in the qualifying contest for the championship will receive a prize. So also will the shooter who on any one day makes the longest straight run in the continuous match.

Shooting will be carried on from 11 A. M. until 5 P. M. each day that the Exposition is open. The first two hours—that is, from 11 A. M. to 1 P. M.—will be given up to those who desire to take part in the continuous match. From 1 to 3, the qualifying rounds for the championship contest will be carried on from day to day. From 3 to 5, the traps will be devoted to sweepstake shooting, special matches, or other attractions, as may be arranged from time to time by the management.

At first sight, it may seem absurd to think of holding an inanimate target tournament on the roof of Madison Square Garden, but the Garden covers a large area, and measurements have been made, proving that the scheme is perfectly feasible. As to how the shoot will be carried on, the best advice that can be given is: Wait until the Exposition opens, and then go and see how it is done.

Missouri State Fish and Game Protective Association.

MR. H. B. COLLINS, the efficient secretary of this sturdy shooting organization, wrote me that matters were progressing very nicely for their approaching tournament in May. The inducements, he states, will as usual be of a substantial nature, their intentions being to add from \$300 to \$500 per day at this shoot. This event has for several years been one of the best that is offered to the shooters of the West and South, so it is safe to say that the St. Louis sportsmen will maintain the customary high standard established for this Association by their Kansas City brethren. The conflict of dates with the Pennsylvania Association is to be regretted, but the Missouri organization is in no way responsible for this, as they have for some time held their meetings the third week in May, and in my reports of these tournaments I have always mentioned that this organization claimed the same dates for each succeeding year. On the other hand, the Pennsylvania Association has varied its dates from April to October within the past six years. It appears to me that this might be obviated, for it is highly probable that there are some shooters who would like to participate in both of these events. If you are making a slate for this season, just put the Missouri shoot on it, for it will certainly be one of the best.

The Daddy at Practice.

Editor Forest and Stream:

After defeating Fulford, who had challenged him for the E C cup, the Daddy of 'em all wended his way to the Nutmeg State in order to familiarize himself with the products of the ammunition company that honors Bridgeport with its presence. After consulting with U. M. C. Thomas, the ballistic expert of the company, he and Hollowell repaired to the 40yds. range, where the "bang" of the gun and the "spat" of the shot on the plate mingled with the choruses of "My eye, that's a corker!" "Did you ever see such a spatter?" etc., until the Bald Eagle was heard to remark, "Well, that's the best load ever went out of my gun!" At that stage of the game, it was decided to adjourn to the grounds of the Bridgeport Gun Club on the following day to test in a practical way the now famous "Heikes load." As no better timber presented itself, J. J. Hollowell was selected to be led up to the altar and sacrificed as the first victim.

The day started in with plenty of indications of a rain, and never wavered from its purpose, as during the shooting rain fell in torrents, and the shooters were drenched through and through. Notwithstanding this drawback, with the aid of an umbrella in the hands of U. M. C. Thomas and an Arizona sombrero on the head of Hollowell, both contestants managed to keep in a good humor and shot as well as they knew how, considering the fact that the ribs of the guns were raised about a quarter of an inch by the rain drops.

The first 25 seemed to fly right into the Heikes load, and were all scored dead; Hollowell, however, allowed two pickups to land in the grass. Result, first quarter: Heikes 25, Hollowell 23.

More rain, more shooting. Heikes failed to connect with his 9th target in the second quarter, and Hollowell lost his 23d, so the 50 left Heikes with 49 and Hollowell 47. This state of things did not suit Mr. Heikes at all, and immediately he proceeded to put distance between himself and his competitor. The argument he produced was thoroughly convincing, as on the finish he had negotiated exactly 99 out of the 100, while Hollowell was trailing along with only 94.

The members of the club did everything in their power to make it pleasant for the visitors, despite the rain, and U. M. C. Thomas, president; Secretary Thorpe and Messrs. Bradley, Hurd, Miller and others, deserve special mention for their untiring efforts.

The members of the club present united in expressing most emphatically their opinions that the Bald Eagle would be heard to scream both long and loudly this year in the use of his new bow and arrows.

OBSERVER.

Garden City Gun Club.

CHICAGO, Ill., Jan. 28.—The score of the Garden City Gun Club's handicap, medal and merchandise shoot at Watson's Park is given below. In the shoot-off for first Dr. Carson won the diamond medal. The 10s divided merchandise and first money. The 9s divided merchandise and money. Shorthaul and Parker won merchandise and money in the 8s. Von Lengerke and Plumber divided on 7, while Stannard in shoot-off won; merchandise allotted to the 6s:

Levi	2012210202100	8	Ehlers	21122220201	9
Von Lengerke	2202220012	7	Barto	2122111012	9
Bissell	12011222212	10	Plumber	211101020001	7
Dr Carson	122102122102	10	Peters	20222222100	8
Goodrich	02022222222	9	Johnson	02210122222	9
Parker	22201101202	8	W Stannard	02002222020	6
Shorthaul	02211020012	8	Wiley	22221102202	10
Amberg	2221101*112	9	Patterson	20200222220	10

Trap at Watson's Park.

CHICAGO, Ill., Jan. 28.—Two matches were shot at Watson's Park to-day, the first a two-men team race for birds and supper between Levi and Von Lengerke on the one side against Amberg and Bissell on the other; Levi was to shoot at 31 birds.

The second race was a tie on 16, 10 birds per man, for price of birds. The scores:

Levi	*202222222*020100212020022120	20
Von Lengerke	222*22202222222222222222	23-43
Amberg	120*121222202021012202222	19
Bissell	21101220212020020212212	19-38
Ten birds, for birds, Shorthaul and Stannard vs. Levi and Parker:		
Shorthaul	2121220001	7
Levi	2002012022	6
Stannard	2022222222	9-16
Parker	1221212111	10-16

Bison Gun Club.

BUFFALO, N. Y., Jan. 27.—The event of the day at the Bison Gun Club shoot was the race between Messrs. E. C. Burkhardt, of the Buffalo Audubon Gun Club, and Foxie, of the Bison Gun Club, for the Clinton Bidwell trophy. The former won by a score of 21 to 18. He shot 3½yds. of Hazard Blue Ribbon in U. M. C. factory-loaded shells:

Foxie	2212220212*20222202*20202	18
E C Burkhardt	2222222*222222022*2022222	21

Pennsylvania State Sportsmen's Association.

PITTSBURG, Pa., Jan. 28.—Mr. Frank W. Bacon, secretary of the Reed-Hurst Gun Club, of Erie, Pa., advises me that the dates for holding the Pennsylvania State Sportsmen's Association tournament have been changed from May 16-19 to May 30-June 2, inclusive. Mr. Bacon also requests me to make the announcement of change through the columns of the sporting press.

ELMER E. SHANER, Manager.

Rifle Range and Gallery.

Cincinnati Rifle Association.

CINCINNATI, O., Jan. 22.—The following scores were made in regular competition by members of the Cincinnati Rifle Association at Four-Mile House, Reading Road, to-day. Conditions: 200yds., off-hand, at the German ring target. Gindele won the championship with a score of 231. Payne wins the Dietrich medal, with a score of 66, for the month of January. Strickmeier wins the Uckotter trophy with a score of 56 points over handicap for the month of January:

Champion score:	
Gindele	20 25 22 24 23 20 24 25 23 25—231
Payne	19 24 17 23 22 21 21 23 23—216

PUBLISHERS' DEPARTMENT.

Hendryx Reels and Bird Cages.

WE have The Andrew B. Hendryx Co.'s two catalogues, one of fishing reels and the second of bird cages. Both are illustrated to show each individual style. The number of reels listed is fairly bewildering, while there are described no fewer than the astonishing number of 350 cages for birds and animal pets. The Hendryx reels are so well known that the beautiful catalogue is sure to be in great demand; and as for the bird cage catalogue it is a revelation of what artistic taste and skill have been devoted to this single article of home furnishing. The catalogues will be sent by The Andrew B. Hendryx Co., New Haven, Conn.

Washington.

NEXT IS A PERSONALLY CONDUCTED TOUR VIA PENNSYLVANIA RAILROAD.

THE next Pennsylvania Railroad three-day personally conducted tour to Washington, D. C., leaves Thursday, Feb. 16. The rate, \$14.50 from New York, \$11.50 from Philadelphia, and proportionate rates from other points, include all necessary expenses during the entire trip—transportation, hotel accommodations, and Capital guide fees. An experienced chaperon will also accompany the party.

For itineraries, tickets and full information, apply to ticket agents; Tourist Agent, 1196 Broadway, New York; 789 Broad street, Newark, N. J.; or address Geo. W. Boyd, Assistant General Passenger Agent, Broad Street Station, Philadelphia—Ado.

OWING to largely increased business, Messrs. C. B. Mather & Co. are now adding to their plant at Rowley, Mass., a new building 100ft. long. This additional space more than doubles the firm's facilities. This is no doubt a part of the general prosperity in which all the country seems to be sharing.

PROPHETS.

WHEN Noah went about telling his countrymen that there was going to be a flood, they derided and mocked him. Since his day prophets have been held in better repute, until now nearly every man who has a theory about game protection constitutes himself a prophet and foretells that if his theory is not accepted and his pet system adopted there will be an end of the world to the game in just so many years, usually three, sometimes five, in rare instances ten. If such and such a law is not adopted, he declares, by the end of so many years there will not be a grouse or a quail left in the State. Sometimes the law thus recommended as a last ultimate final expedient to save the game is not adopted; the stipulated term of years comes to an end, and when the shooting season opens the prognosticator of game annihilation loads up the old gun and goes out for his share of the birds.

These cock-sure prophets would do well to take a lesson from the wiser Audubon. The great naturalist was without a peer in his generation as an observer of game conditions, and foresaw with clear vision the game-depleting effect of that civilization which in his day was chopping its way westward with the axe of the pioneer, and shooting its way westward with the rifle of the Indian fighter and the market hunter. Yet when Audubon prophesied game extermination, he made his conditions so circumspectly that no one of his contemporaries could survive to disprove him, nor indeed could his prophecy be questioned by generations to come. For of the deer he wrote, *italics our own*: "Notwithstanding the almost incredible abundance of these beautiful animals in our forests and prairies, such havoc is carried on amongst them that *in a few centuries* they will probably be as scarce in America as the great bustard now is in Britain." A safe prophecy that, whether false or true. Less than one of the centuries has elapsed, and already throughout vast areas of the continent he traversed in his wanderings the extinction has already been wrought, and his foretelling has been vindicated.

A BUZZARDS' ROOST.

A STORE of game history is locked up in our American place-names. Buffaloord in North Carolina, Buffalolick in West Virginia, and Buffaloridge in Virginia, not to mention the Buffalo-bluffs, and -runs, and -springs in various localities, are suggestive of the former presence of that big creature in log-cabin days or before. The elk has given names to settlements, and so has the deer; there is a Fawn's-Leap in the Catskills, where the memory of man runs not back to the time of deer; just as there is a score of Indian Maiden's Leaps where no Indians have frequented for generations. There is an Alligator in Florida, another in Georgia, and a third in Mississippi; but from these perhaps the *genius loci*—the genius of the place—has not as yet departed; no more than Bob White has flown from the Quails of Kentucky and Virginia, nor, let us hope, the partridge from the towns which bear its name in Alabama and other like favored States. There are numerous Bears and Bear Creeks where Bruin never comes back to claim his own; and a Beargulch and a Bearhollow where toddling infancy may make mock of the baldhead unafraid. As for Catamount, and Lynxville, and Panther Creek, surely no curfew bell need ring in them to keep young folks off the streets o' nights.

But what we had in mind to inquire was of what has become of the sweetly named Buzzards' Roost, which used to gladden the eye of the traveler who studied the Florida railroad time schedules thirty years ago. It was on the route through Georgia, at a point in the long, long tunnel cut for miles and miles through pine barrens and cypress swamps; and going south or coming north, bound east or west, one always struck it by night. There was something in the name that challenged attention, piqued curiosity, created interest, aroused anticipation, and as certainly ended in disappointment, because in the gloom no street lamps, no illuminated shops, no dwellings, no hotel, no station, no buzzard roost, no anything but pines and scrub palmetto and railroad track and water-tank could one see. Buzzards' Roost as a town, we have come to think, may never have existed; it may have been not "a local habitation and a name," but just a name and a water-tank; and when the exigencies of a new management demanded the change the tank was

moved and the name, stricken from the schedule, was lost to all but the memory of the weary traveler whom it had deluded in the old days. Doubtless the buzzards roost there yet; and among them there may be an old bird, "the last leaf upon the tree," garrulous of those days—or nights—when from the halted train the jaded passengers emerged to stretch their legs and peer into the gloom of what was one of the most picturesquely named spots on the North American Continent.

BOUND VOLUMES.

THE frequency with which we receive requests for the index of each succeeding volume of FOREST AND STREAM throws an interesting light on the growth of the practice among subscribers of binding their volumes of the paper as each is completed, and retaining them as a valued library of information on outdoor sport. Not only this, but we receive a constantly increasing demand for indexes of volumes printed many years ago, a demand which we are usually wholly unable to supply. Many a man has fifteen or twenty volumes of the FOREST AND STREAM, complete except for perhaps a number or two, or an index or two, and when he determines to have these bound, so that they may be conveniently accessible, he applies to us for the missing numbers. So it is that we are frequently obliged to advertise for back numbers, some of which we never obtain. It is only a year or two since one of the best equipped and most ably managed libraries in one of the largest cities in the Union paid \$2 for a certain missing number to complete its file.

A kindred matter, which is interesting as showing the impression made on readers by certain articles appearing in FOREST AND STREAM, is the frequent requests that come to us for back numbers, the date of which the inquirer has forgotten, containing some article whose title he does not remember, but the gist of which he can give some suggestion of. The finding of such articles is usually impossible. Success in such a search would imply on the part of the employees of this office a memory of the subject matter of every thing that had appeared in FOREST AND STREAM, with the further recollection of the title under which it was published, and the date at which it appeared. Sometimes, if the inquirer's information is sufficiently specific, the indexes might show the article, yet often they do not, for the title may have no reference to the particular subject to which the inquirer refers. So that if we were to look up all the articles for which our correspondents ask, the information might be secured only at the cost of many hours' work, and when obtained might consist of nothing more than a title and a date.

The binding of the volumes of FOREST AND STREAM complete, that is to say, the advertising pages with the reading matter, as is usually done, makes the volume somewhat more bulky than it would be if only the reading pages were included, but is not without certain advantages. One of the most obvious of these is the opportunity which it gives to refer back to old advertisements, and these advertisements are, as a matter of fact, of considerable historical interest. A study of the business announcements in the FOREST AND STREAM for the past twenty-five years shows the rise and development of many a new implement for sport which has proved to be just what was needed, as well as the rise and fall of many another implement, put on the market with high hopes by its inventor, but which failed to fulfil his expectations and has now been long forgotten.

MOUNTAINS.

WITH his latest published communication in the FOREST AND STREAM on the subject of the ascent of the Grand Teton, Mr. Owen expressed his determination to write no more; and Mr. Langford's letter of to-day may therefore be taken as closing the discussion. One result of the controversy must have been to demonstrate that we have on this continent Alpine opportunities that well may challenge the attention of mountain climbers. The sport of mountain climbing is as yet undeveloped in America; but the time will come when it will number its votaries by the hundreds. Such a discussion as this respecting the Grand Teton must give impetus to the sport. The peak is one whose ascent offers an emprise worthy

the endeavor. No season should go by without lengthening the roll of those who have set foot on the glorious height. The Alps are the playground of Europe; the Rockies some day will be the playground of America. Once a mountain man, always a mountain man. When the Rockies have cast their spell upon the spirit of man, though a thousand miles of land and water stretch between, and though the body be held as in chains, longing fancy carries him back, and hope whispers of a time when he shall see again the snowy heights flushing in the sunset glow, and shall spring again from tent at dawn to greet the coming day.

SHIPS.

WE have long realized the fitness of a word concerning the ship appendage so commonly added to game and other animals. If Podgers will amiably assent to being held up as a horrible example, we venture to cite his employment, in his "Commentaries" in another column, of the expression "his skunkship." He makes out a very fair case for a despised creature generally held in bad odor, but while he defends the skunk, who will venture to defend skunkship? Would not plain skunk be better?

As intimated, this is one random case out of many like instances. It is common for writers to add ship to their game or fish. Squirrelship, troutship, mooseship, snake-ship, alligatorship—these are some of the combinations. And in every single case the plain name with the ship omitted looks better, reads better, sounds better. The practice is no new thing. As far back as the fifties the author of that delightful sportsmen's classic "Camp-Fires of the Everglades" referred to a muskrat in a trap as "his ratship." Probably in lands where ivory grows they relate stories of adventures with "his elephantship," for if a rat may be shipped, much more may an elephant. Reckoning from the "ratship" of the Florida story which first appeared in the old "Spirit of the Times," we have had at least forty years of the shipping; and now we ought to be able to get along forty years more without it. And may Podgers live the forty years to write in his charming way of the dumb creatures which cannot speak for themselves.

PHOTOGRAPHS.

THE award of the third prize of \$10 in the live game class of our Amateur Photography Competition was not announced last week because of some question as to the conditions under which certain pictures had been made. The prize was divided equally, and was awarded to Mr. Livingston Stone for his photograph of two bear cubs in the Shasta Mountains in California, and to Mr. Geo. S. Raymond for his picture of a mink. As the photographs will be reproduced for publication in our columns, further comment may be deferred.

SNAP SHOTS.

A correspondent makes inquiry about the name of the passenger pigeon. The bird has been so called from time immemorial. While all the migratory species may be termed birds of passage, the application of the term particularly to the pigeon may have come from observation of the fact that its migrations were not regular and fixed by seasons, as with those birds that fly south in the fall and north in the spring, but were governed by the food supply of mast. The pigeon hosts were now here, now there; they were pilgrims and strangers, the gypsies of birdhood, passengers. The migratory birds stay somewhere when they get there; but the passenger pigeon is ever on the move—or was ever on the move until finally he passed on not to return.

Commissioner Bowers sends us a tabulated exhibit of the catch of American fishing vessels landed at Boston and Gloucester in 1898. The fishing vessels made 6,932 trips, and the fish listed are cod, cusk, haddock, hake, pollock, halibut, and mackerel, with miscellaneous, including herring; and the total catch was 143,403,740 lbs., with a value of \$1,947,448.

The proposed Maine hunting license discriminating against the residents of other States has been killed in the Legislature. In other words, Maine will stay in the Union.

The Sportsman Tourist.

In Old Virginia.

Part Three.

THE deer might well be called the emblem of peace in the South, as it came into the game list soon after the beginning of the calm that followed the great storm of the 60s. The negroes scattered, the plantations wrecked, the young men dead or discouraged, and the old men impoverished, it was soon the acre instead of the thousand that was cultivated, and much land that had been in a high state of cultivation before the war was given over to the field pine, scrub timber and sedge grass. Then the timid deer that in the days of peace and luxurious plenty had been hunted to the verge of extermination, and driven to the inaccessible swamps, ventured forth and found a goodly land, from their point of view, with few to molest or make afraid, and proceeded to possess it.

So favorable have the conditions been in the matter of range, climate, etc., that notwithstanding the fact that hunting the deer has steadily increased for the past fifteen or twenty years, the sportsmen declare that each year sees an increase in their number in old Virginia. One not familiar with the present conditions existing there finds it hard to believe this statement, and finds it difficult to reconcile with his preconceived ideas regarding the oldest and most highly developed State in the Union, as Virginians invariably insist their State to be.

The fact is that the sporting blood of the old Dominion lay dormant for many years after the late unpleasantness, while the old men learned to starve patiently and use their crutches gracefully; and the surviving young men essayed the novel experience of earning their bread by the sweat of their brows.

My hostess informed me one evening that she had arranged a deer hunt for me, through the kind courtesy of an old friend of the family, Col. Greg, and we must be up with the lark the following morning in order that I might reach the rendezvous in time. The boy came in early next morning to make my fire.

In response to my query as to the weather, present and prospective, he replied: "Hit cl'ar, suh, cl'ar; an' a big fros'. Won't nothin' stop a deah if ole houn' git affah him dis mawnin'." Going down after another armful of wood, he returned in great excitement to say that Col. Greg's man had just passed by on his way to a neighboring plantation, to notify some of the Colonel's friends of the hunt that they participate, and had left word that he would return soon to accompany us.

This information soon reached headquarters and resulted in general orders thus disseminated by Millie (the maid): "Aunt Ellen, Mis' Lady say as how you bettah git up an' git 'bout dat brexfus, or how dey all goin' git of' to de huntin'." This at the top of her voice, as negroes always transmit orders.

Aunt Ellen (the cook): "You, Govnah, you git 'long down to de wood pile, an' tell dem triflin' niggers to tote me in some wood des as sudden as dey kin 'fore I take an' 'tar dey haid off. Dat I got to git Mis' Lady's brexfus, and de odder gemmans too, dey gwine huntin'."

Governor's voice, keyed to its highest pitch, is soon heard piping all hands at the wood pile, and after much shouting back and forth among the boys the axe begins to ring out its merry song of the cord.

You may classify speech as the baser metal, the sixteen to one, as it were; but when it comes to inaugurating the initial step to breakfast on an old Virginia plantation it is the coin current of the realm, and freely used, as just shown, would accomplish more in five minutes than the much-lauded golden silence could do in a year.

By the time we had finished breakfast and I had donned my "top clothing" the horses were at the old-fashioned stile, or horse block, or upping block, as it is variously called, in front of the house, and there my hostess, who had sacrificed her morning nap on the altar of hospitality, came to see me off and wish me success. It was to be a "drive," and the hunters were to be distributed on various stands where the deer were most likely to run when jumped by the dogs. Col. Greg, a famous driver, with his well-trained dogs, was master of ceremonies, and had appointed the several stands, giving me, as I afterward learned, the best position. The six-mile ride through "brake and 'brae" on a good horse was a most delightful beginning, in reality, to the day's sport, in anticipation. The foliage hung thick on much of the timber in the lowlands along the water courses, and colors—from old gold to fiery red—ran riot over all. A heavy frost had fallen, and crisped the clay surface of the road till it rang to the echo under the shod hoofs of our eager horses; and on the high land, where the sun was coquetting with it, was a sheen of diamonds more gorgeous than ever graced the diadem of earthly monarch.

Eager enthusiasm was the prevailing condition with all. Hunters, horses, hounds and even the negro messengers sent to direct us to our positions, and running at our several stirrups, were filled with the excitement of the chase. Some of us were lacking in experience, but there was a full quota of enthusiasm.

My conductor was an old dorky, well informed regarding the habits of the deer. He exclaimed to me, "Dat dey mos'ly did dey pickin' in de night time, an' endurin' of de day just lay 'roun' in de sedge grass and briar patch, and clos' thicket, jus' like ole haar."

He gave me much more information on this and other subjects, talking all the time, when not out of breath, being apparently of the opinion that it was his duty to entertain me. He wound up by admitting in a confidential manner that he "wa'n't a reel Vurginy niggah, but was bornd an' raised in Nawth K'liny, but dat nobody didn't know it 'ceptin' dem as was educated, like you, sah, an' dem I just tell 'bout it, 'cause dey fin' out everything de dem to know. My ole woman say as how folks kin look at me an' tell I ain't reel Vurginy stock, but I tell her dat jus' 'cause she is educated herself. She kin read—my woman kin read 'ritin', suh, an' figger like a rattlesnake; she kin figger de whole crap out 'fore I kin git hit gathered an' sold, an' she kin figger whole passel moh den I kin git fo' hit too. She is sho educated a heap, I tell you, suh."

Touching my horse with the off spur, I struck a gait

that caused the old man to quit wasting his breath in talk and concentrate his entire energy on keeping up, and before he could recover sufficient breath to resume his discourse we reached my stand.

It was on a flat about 50yds. wide, with rising ground on each side; one slope covered with corn in shock and the other heavily timbered.

My man placed me at the edge of the timber, facing the opposite slope, and told me that the drive was from down the valley to my right, and that was the direction I was to watch and listen for the dogs.

There was a fence across the flat a few rods away on my left, and I asked the old man what the deer would do when he reached it. His reply was: "Sail over it just like a bud, suh, 'less you dun fill him full of buck-shot wid dat fin' gun, suh." He then lifted his old hat in a respectful manner and turned back to lead my horse back in the timber out of sight, telling me he would be within sound of call if I wanted him.

Slipping buckshot shells into my gun, and setting it against a tree within reach, I seated myself comfortably on a moss-covered root and instituted a search through my pockets for the only needed accessories to perfect comfort. I had found my pipe and set it between my teeth, had my tobacco pouch in my hand, and was in the act of drawing my match safe from an upper pocket, when there was a crash in the thicket to my right. The pipe and tobacco were recovered later on after a long search, but the match safe remains among the "things that were" to this good day. I had thought it possible that close contact with a fine wild buck, rampant, might produce buck ague in even as old a campaigner as I, but to start every muscle in my anatomy and throw away my valuables on so slight a foundation as a sound was rather extreme. Fortunately my self-control was sufficient to prevent my investigating the noise with buckshot, and in a moment the cause of the crash in the thicket appeared in the person of Col. Greg, the master of the hunt. He was mounted on a big iron-grav horse, and rode forward to where I stood as soon as he discovered my presence.

Courteously ignoring the very evident fact that I was laboring under the excitement of a nervous shock, he introduced himself to me, and commended me on being on the qui vive. "Have you been here long?" he asked.

"No; not over ten minutes," I replied.

"Ah, I am sorry. A fine buck ran your stand not more than fifteen or twenty minutes ago, and my purpose in riding over was to see why you had not paid your respects to him. Come with me 'here a few steps and I will show you where he passed."

We found his tracks not over thirty steps from my position—so close that I might almost have knocked him over with a rock had I been in time. My regret was deep and sincere, but it was a case of spilled milk—cream in fact—and no amount of regret could avail.

The Colonel told me that the dogs had jumped the deer while some distance away, and had run him right by where he sat on his horse with his gun in hand, but seeing that he was running for my stand he had refrained from shooting him, in order that I might enjoy the privilege. A rare and beautiful exhibition of unselfish consideration was this, and that it failed in effect was all owing to my tardiness. We sat down to await the return of the dogs, as the Colonel assured me that they would not run more than six or eight miles before turning back under the guidance of old Lee, who had been trained to quit a chase after the stands were all passed, and seldom failed to bring the pack back for a fresh start after passing the point where the hunters were stationed, unless they should be pushing the deer very closely. While we waited and smoked the Colonel told me of the remarkable experience of a friend of his, a physician, on the same stand we were occupying, that occurred the season before, when he and several neighbors hunted regularly. This is the story in his own words, as well as I remember it:

"We hunted at least once, and often twice, each week the season through. Every one of us had several chances excepting the Doctor; his luck never varied, and was always the very hardest kind. We did everything possible to get him a shot, changing his stand each time, and invariably putting him in the most favorable position. But he was a veritable Jonah.

"Deer jumped in line with his stand again and again, but they would cross to other routes never before taken by them, or do some other unusual and unexpected thing; in fact, we finally agreed that one would certainly turn and run over the dogs if pressed hard and headed for his stand.

"The Doctor alternately swore and laughed at his hard luck, but utterly refused to give up. He vowed that he would keep on until he got a deer if he had to put in every day of his life for the next ten years on a deer stand.

"Every time we met for a drive the Doctor was on hand, and at the end of the season he had not seen a live deer.

"The next autumn he rode over to my place several days before the opening of the hunting season to inquire about the date of the first hunt, and he was on hand as usual when it came off. Declining the choice of stands, he was assigned the stand you are on to-day, and I was on the next from him, just over that little rise of ground beyond the cornfield.

"We had waited but a short time, when we heard the dogs coming in full cry. They were running in our direction, and the Doctor, being a confirmed 'hoodoo,' I thought I was to open the season with the first deer to bag. Standing at ready, and listening to the music of the dogs, I waited for the expected appearance of the deer within range. They seemed headed right, and were coming fast my way until the dogs were near enough for me to distinguish their individual voices, and then, just as my expectation had all but reached the point of assurance, they swung off to the left and made straight for the Doctor's stand in full and eager cry. Under any other circumstances I should have felt greatly disappointed, but as it was my unlucky friend, the Doctor, who was to gain by my loss, I was glad that it was so. On they went, straight up the stretch that you see leading to this point, and I waited in a much greater state of excitement for the report of his big old ro-bore than I would have felt had the deer run on by my stand,

I was just wondering what would happen to prevent the Jonah from getting his deer, when bang! bang! his big gun roared with a regular broadside. A moment later and I heard his old rebel yell of exultation, louder than the report of anything less than a gun on wheels, and I quickly replied with a similar shout of honest congratulation, and started in a run for the old fellow's stand to be the first to witness his supreme delight.

"The distance was about one-quarter of a mile over rough ground, and I don't strip light for a sprinter, but it was little more than ten minutes after I heard his shout till I reached his stand here.

"Instead of turning handsprings or trying to stand on his head in pure delight, as I expected, the Doctor was standing out there in the open about 50ft. from where we sat—and such an attitude of dejection as he had assumed I had never in my life seen before.

"You got him, Doctor, didn't you?" I shouted, as I ran up out of breath.

"It was nearly a minute before he answered my eager question; and then, with his eyes still fixed on the ground, as when first I saw him, he replied, 'Yes, I got him—temporarily.'

"I looked all around, but could see no deer. 'Where is he?' I finally said.

"Without moving so much as his eyes, he replied very deliberately: 'I don't know just about where the infernal thing is now, sir.'

"He stood with his arms hanging straight down; there was no sign of his gun anywhere, and I really began to feel very uneasy about him, fearing that he had suffered some serious injury from the bursting of his gun or other accident. In order to get time to collect my wits and think what was best to do, I stepped over here to this tree and set down my gun and walked back to where the Doctor stood, still in the same position. He turned his head round as I came up, looked at me a moment, and then proceeded to explain the puzzle to me in this wise:

"Colonel, if you never before saw an all-round, egregious, unmitigated, star spangled, stub and twist, rebounding locks, choke-bored, old, four-ply ass, just look at me; take a good look, a good, long, satisfying look, for I am the only one there is, an original package, and put up one in each box,' his voice rising as he rolled out this string of self-vituperation, and ending in a shout. 'Yes, look at me,' he continued. 'You think I'm crazy, don't you? Well, I ain't. I'm only just a post-graduate, first honor fool, pure and simple; and I will give my professional services for one year to any athletic individual that will diligently kick me for ten minutes; I will, honestly.'

"I begged him to control himself, and explain the cause of his excitement, which he finally proceeded to do to this effect:

"When I heard the dogs coming in our direction I supposed of course the deer would run your stand, but proceeded to prepare for the unexpected, examining my shells and getting in position. When the deer changed his course, as shown by the dogs, and made for my stand, I was well nigh overcome with surprise and delight. I saw him when he rounded that point 300 or 400yds. below the thicket, and a more beautiful sight never greeted my eyes. He was a noble buck, and was going at a gait that was fast leaving the dogs, which seemed already more than half-mile behind and were apparently bothered by his sudden turn from the line he had been running toward your stand.

"When not more than 25yds. from me, I stepped out, threw up my hand and spoke sharply, just as you had instructed me to do if ever a deer should come my way, and as he tried to stop himself with two or three short buck-jumps I poured in my right barrel, and as he stumbled and faltered, to make assurance doubly sure, followed it at once with the left, and had the exquisite pleasure of seeing him pitch in a heap just there—indicating the place on the ground at which I had found him gazing—give one slight quiver and then stretch out, apparently stone dead.

"Then it was that I proceeded to send forth that idiotic yell that nearly split my throat. No words can express the delight I felt at having finally succeeded in bagging a deer, and the finest one I had ever seen at that.

"Running up to him, I walked around to view him from all sides, stooped down and felt the firmness of his magnificent antlers. Then noticing that he had fallen with the fatal wounds exposed, proceeded to count and professionally diagnose them. One, two, three, four, five, six, seven buckshot wounds, any one of three of which, I argued, would have been instantaneously fatal. Then noticing a faint quiver of the eyes, I stepped back and scuffed my feet in the dry leaves to see if he could show any signs of life. A faint tremor passed through his body, which I concluded to be the relaxing of the muscles immediately preceding "rigor mortis."

"Just then the dogs came in sight, and I again raised my voice in an exultant yell, glad even to have the dogs witness my triumph. They all broke into full cry when they heard my shout, and came sweeping up on the trail of the deer. Hearing a noise near, I turned just in time to see my dead deer scramble to his feet and make off at a rate of speed that utterly defied the swiftest dog in the pack.

"It's the cold truth, Colonel, just as I tell you; and in two minutes dogs and deer had run clear out of sight, and hearing, and I will bet a horse to a hen that that dead deer can run across the State of Virginia and half-across Tennessee without stopping for so much as a drop of water."

"But why in the name of common sense didn't you shoot him again when he jumped up, Doctor?" I asked.

"Why didn't I?" he almost shouted. "I thought that matter sufficiently explained by what I said to you when you first came up, sir. I didn't shoot him again because there was no one by to tell me that any fool with sense enough to bell a buzzard ought to know better than to stand around in the field when hunting so full of admiration for himself that he could not reload his gun. My gun was not loaded, sir; and furthermore my shells were carefully buttoned up in an inside coat pocket.

"You will observe that I tore most of the buttons off or buttonholes out of my coat, trying to get my shells after it was too late; but the deer was out of sight before I ever touched one."

The Rainbow Country.

We tarried several days at the cabin, exploring the lake shores and the surrounding country.

The lake itself is a great basin of limpid spring water, on which we never tired of floating. So translucent is it that the bottom may be seen through 25 or 30 ft. of water. Rugged mountains, clothed with unbroken green, rise all about it, and are duplicated in its marvelous reflections. The shores are rocky, in places great ledges and cliffs rising perpendicularly from the water; and a number of picturesque, circular islands have rims of white boulders placed so evenly that one is reminded of country flower beds bordered with pebbles. The whole bed of the lake is strewn with great rocks, some of enormous size, which in places rise above the surface or lay in wait for the unwary canoeist just below.

It was startling as the canoe passed swiftly along to suddenly see the loom of a great dark mass, apparently shooting up from the shadowy depths, like some great submarine monster darting upon its prey. At one place where the water is very deep the lake is dotted with many of these rocks, looking at a distance like a fleet of boats at anchor. Some jut several feet above the surface, while others expose a tip no larger than a dinner plate, but under water they are of huge proportions. There is an old dam at the outlet, built some forty years ago, but now pretty well rotted out. Standing on it and looking back up the lake, a magnificent view was presented.

The silver waters stretched away before us, dotted with rock rimmed islands, and guarded by the eternal mountains. Here and there on their rugged slopes great ledges and cliffs of bare granite, old and gray with the storms of centuries, showed among the green of the endless forests, and clumps of great pines rose black and grim above their lesser brethren. To the eastward, towering above the intervening ridges, Katahdin, the abode of Pomola, and the home of the thunder and the lightning, rose in solitary grandeur into the blue Katahdin, from whose granite brow we had first beheld the gleaming water, in whose rainbow depths the mountain's mighty bulk was now mirrored.

Below the dam was a pool, 6 or 8 ft. deep, but so clear and colorless that every grain of sand on the bottom was seen as distinctly as through crystal.

We found that it was useless to fish except just at daylight or at sundown. In that clear element the trout could be lured to the surface at no other time.

We had some excellent fishing in two small ponds known as First and Second Rainbow Deadwater, which are expansions, or, in Down East parlance, "bulges," of Rainbow Stream. To reach them we carried the canoes around the dam and down stream to a point where there was water enough to float them, for the outlet is but a small brook, and unnavigable.

The outlet of the second deadwater was completely filled with a dense, tangled mass of dead timber and driftwood.

One night we fished till it was so dark we could not see our flies, but struck at the splash made by the trout. They had been rising well since sundown, taking the Parmachenee-belle and red-ibis, but as the twilight deepened we changed our casts to white-miller and coachman. William and Nick had returned to camp early, but Harry and I continued to cast. The fish ranged from $\frac{1}{4}$ to $\frac{3}{4}$ lb. in weight, and were full of fight and vigor. It was the best fishing we had had, and when we had enough for supper and breakfast and finally unjointed our rods the night was upon us. It was commencing to rain, and no moon or stars pierced the dark canopy of the sky. The mountains were jet black walls, but there was a dim glow on the water. We found the landing, and leaving one canoe and the rods behind, plunged into the dense gloom of the woods. We could only follow the narrow trail by feeling the way with our feet and by watching an occasional rift in the foliage overhead. Jean carried his canoe, and I the trout, sagging heavily on the end of the stringer. I fell twice, and Jean said afterward that he was on his knees half the time.

So we blundered on over bogs and through mud holes till we could proceed no further. We seemed to be in a sort of pocket, from which there was no egress, and it was evident that we were off the carry. Dennis left us to find the right path, and we stood waiting in the black, silent woods. Bits of phosphorescent wood made strange luminous spots at our feet, but otherwise the land was given over to darkness and silence. After a while we heard a hoot from the direction of the camp, and knew that Nick and William were anxiously awaiting us. Then a light appeared, dodging among the trees, and Dennis came, finding his way back to us with an improvised torch of birch bark. We found ourselves in a narrow space between two large fallen trees and confronted by a perpendicular ledge, breast high, over which they lay. We lifted the canoe and Dennis took it on his head, while Jean went ahead with the torch. We found our way back to the dam, and saw across the lake a fire on the shore, which was Nick's beacon to guide us to the camp. Owls were hooting on the mountains, and as we paddled over Jean answered them, bringing a chorus of responses from every direction, the calls echoing weirdly back and forth across the water. The owls by night and the loons during the day kept the echoes awakened.

There were several pairs of the latter on the lake, and their wild laughter mingled with the screams of the gulls that circled on tireless wings above them. Both species raise their young on these northern waters; we once found a loon's nest on Lobster Lake. One day we became suddenly aware that a pair of gulls were much disturbed by our presence. With shrill cries they followed the canoes, now dipping down close over our heads, then rising high in the air, only to return again. Some one remarked that they acted like birds whose nest is approached, but we were far out from shore. At that moment their excitement increased, and with louder screams they flew closer than before. Then, looking about, we saw the cause of their solicitude, for swimming ahead of us, making frantic endeavors to escape, were two young ones not long out of their shells. They could not fly, but how they could swim.

The little ones made no sound, but their heads were in constant motion, as they looked from side to side for the danger of which their parents were warning them, and their webbed feet were propelling them at a prodigious rate. As long as we attended to our own affairs

they swam in a straight course, but when we pursued them they proved that if they could not fly they could dodge as well as swim. Paddle as hard as we could, it was all we could do to overtake them, and just as we thought they were in our grasp they would dodge to one side and the canoe would shoot by. Before we could turn they would have a good gain on the tangent; but finally one was captured and tenderly passed from hand to hand till all had seen him. The old birds screamed louder than ever, and the chick pecked at our finger, but had not strength to hurt. He was a forlorn-looking object, with a big head and bill, and a small body covered with down. His wings were nothing but pin feathers, but the legs seemed muscular and strong. We returned him carefully to the water, uninjured except as to his feelings, and he swam swiftly away, the old ones coming down to him to see if he was all right after his thrilling adventure.

We were on our way to a small beaver pond that lay back in the woods. The industrious rodents had a dam across the brook that drains it into the lake, and two of their houses lifted their domes above the water. Their cuttings were everywhere; one poplar 18 in. in diameter had been felled, and another fully as large was cut partly through. Caribou tracks were plentiful around the boggy shore.

Leaving this pond, we climbed over a hardwood ridge, marking our path by breaking twigs from the bushes as we went to another pond, one of the Debsconeag chain. The ridge was covered with immense boulders, and the trail led through narrow passages and defiles between them. They only stopped at the shore of the pond, and climbing to the top of one whose base was washed by the waves, we looked out from the arching foliage above us at a picture of utter solitude. The pond, one of Nature's gems, in a setting of mountains covered with waving green, lay dimpling and flashing in the sunlight. On the ring-hand shore was a little white sand beach, and there stood a good-sized buck looking out over the water. The wavelets lapped against the rocks and a breath of wind stirred the leaves; but except for these soothing sounds silence reigned supreme. It was a scene, all too rare nowadays, of Nature pure and undefiled; uncontaminated by so-called improvements, and restful to the soul as well as to the body and the mind.

Such are the places I like to seek out on my excursions—the out-of-the-way nooks, whose hidden beauties have a charm all their own—and whether it be Chesuncook Pond, black and sullen under a frowning sky, or this one of the Debsconeag, with its sun-kissed waters reflecting the blue above, Nature is never disappointing. There is always something to study and think of in her varying moods, and she gives us what loss of wealth or position can never take away, but which remains a constant pleasure, treasured in memory while life lasts.

On our trips up and down the lake we used to stop at a great spring in a grove of shaggy old cedar trees. It was 10 ft. in diameter and of marvelous purity. Cold as ice, it welled up sparkling and clear between the roots of the big trees, a fountain for the wild dwellers of the wilderness. Further up the hillside were some old-growth spruces that furnished us some excellent gum, and beneath them stood a bark lean-to, where some hunter, overtaken by night, had slept.

In that northern land, though the days may be hot, it is cool after sundown, and one night there was quite a heavy frost, though the month was August. Many of the more tender weeds were black and dead in the morning. The guides spent one day blazing out a trail to Nahmakanta Lake and clearing it of brush, that we might lose no time on the carry. It was well they did so, for the path was very blind, and the old spots nearly obliterated. As it was, they followed a line of spots that took them four miles out of their way, and proved to one of old Louis' trap lines.

Our last day at Rainbow was a peaceful Sabbath. We spent it quietly about the camp, but as the sun sank low in the west we drifted out on the lake in the big canoe. The calm sky above and the peaceful lake below both were tinted with rainbow hues that changed and blended and faded, as the golden ball sank behind the mountains. Then from behind Katahdin the full moon rose serenely into the sky, and her pale beams shed a soft, mysterious light over sleeping lake and silent forest.

The faint tinkle of the outlet purling over its pebbles, the distant hoot of an owl, the splash of a leaping trout, alone broke in upon the witchery of the night; and these sounds, far from being false notes in the harmony, only added to the charm of the place and time. Once there came a distant crash, far away in the woods, and after it the silence seemed more intense. Some tree back on the mountain side had been added to the fallen timber, to lie and decay where it fell.

So ended our sojourn in the Rainbow Country. The following morning we carried to the first deadwater, paddled through it and the second, and made another carry to the third, where we surprised a buck at his breakfast.

Then commenced the long three-mile portage over the trail the guides had blazed out. After getting up the ridge, the country became more level, but the mountain sloped up on our right. We seemed to be traveling in the old bed of a stream. After a mile or more we began to descend, going down through a narrow, steep defile, where great mossy rocks walled in each side. We kept on, going down through woods of old growth—pines, spruces, hemlocks and yellow birches—whose huge trunks seemed as ancient and enduring as the old gray rocks from whose crevices they sprang. We had dinner by a cold spring and then took up the trail again, till we struck a logging road that took us out to Mahmakanta.

At the junction of Bear Brook and Pollywog Stream there are two graves beside the carry. A rough stone found on the spot marks them, and there for over forty years the men have slept since the day when they were drowned.

ROBERTS and I. DEMING.
Drowned May 2, 1856.

Such is the simple inscription scratched on the stone, an on Pollywog Stream are the graves of seventeen other men, who went down to death in the raging waters of spring freshets while engaged in the hazardous work of the lumber drives. Two stones from the forest and a rude post carved with their names show where they lie.

Pollywog Pond lies high up on Ansuntabunt Mountain,

"It was very hard for me to control myself, the whole thing was so very ridiculous; but I valued the Doctor's friendship very highly, and it was evidently too serious a matter with him to be laughed off.

"Where is your gun, Doctor?" I finally asked. "I don't know," was the reply. "I remember taking it by the muzzle and looking around for something to break it over, and not finding anything convenient I threw it away, threw it as far as I could, and don't remember in which direction it was."

"Well," said I, turning aside to hide the laughter I could no longer control, "come and I will help you find it."

"No, thank you, Colonel," said he; "I appreciate your kindness, but I don't want the gun. Anybody that does is welcome to it, if they know enough to use it, I don't, and I'm done hunting. This is the last time you need trouble to count in the prize fool when getting up your hunts."

"He kept his word too, and I have his gun now at my house, where I carried it after I found it nearly soft, from where he threw it from him in his rage."

The Colonel had paused occasionally during the telling of the story to sound his horn for the guidance of the returning dogs. Finally they straggled in travel-stained and exhausted, and were pronounced unfit for further active service without a good long rest.

By well-known horn signals the hunters were gathered in and informed that the hunt for that day was about over. Thereupon one of them suggested that, as we were nearly all going the same direction home, we might accomplish something with a line drive.

The Colonel explained to me that a line drive was simply forming the entire company in a line 25 yds. apart and riding across the country abreast, with the hope of jumping deer.

Quite a number fell in line for the drive, making a line nearly half-mile long. The Colonel, with his dogs, was in the center, and I was on his right; on his left rode a little wiry fellow, on a mule, carrying a big 10-bore shotgun.

We had ridden two or three miles without starting anything larger than rabbits, when the dogs in passing through a brush and brier thicket ran right on a fine buck, and before he could get a good start were all around him on every side.

He was not more than 50 ft. from the little man on the mule, and none of the others were near enough for a shot without endangering the dogs. It was a great surprise to all, as, confused by the dogs, he came sailing out in tremendous buck-jumps. But the small gentleman's mule, to judge from his actions, was the most genuinely astonished of all.

Before his rider could bring his 10-bore gun to bear on the deer, the mule began to imitate its jumps, apparently determined to see it and go it several better. I have seen mules do almost everything except what was expected of them, but never before, nor since, have I seen one jump and buck as did that ambitious enthusiast, which looked like he would like to bet his last he-haw that he could outjump any buck in Virginia. The hunter was game, and stuck to the mule, trying to control him until, finding that his efforts were accomplishing nothing, he dropped the bridle and took a snap shot at the deer, but without effect.

The mule's performance up to the time that the big gun, loaded with 4 to 5 drs. of black powder, was fired between his ears, was but preliminary, judging from what then occurred. He seemed to take leave of terra firma for a while and take the role of aerial contortionist, and finally, when an ordinary horseman would have been dizzy, sick and half-dead, he dropped down to the ground long enough to get a good brace for his feet, and shot his little rider into the air to such a height that I felt sure the fall must dash out his life.

All of this had happened very suddenly, and the big buck was still jumping among the dogs, while the nearest hunters had but turned to ride down on him.

And now I was treated to an exhibition of the staying qualities of Virginia sporting blood. The little hunter, thrown from his mule, was still hanging to his gun, and while in mid-air, so to speak, he fired, whether voluntarily or involuntarily I don't know, and tumbled the buck among the dogs as dead as ever the Hector of the translations; but it was a half-hour before he revived sufficiently to realize the fact.

LEWIS HOPKINS.

The Linnean Society of New York.

REGULAR meetings of the Society will be held in the American Museum of Natural History on Tuesday evenings, Feb. 14 and 28, at 8 o'clock.

Feb. 14.—Jonathan Dwight, Jr. "The Plumages and Moults of a Few Local Species of Our Birds."

Feb. 14.—By members. "The Warblers of North America." Exhibition of specimens, with discussion of distribution, habits, etc., of magnolia, cerulean, chestnut-sided, bay-breasted, black-poll and blackburnian warblers.

Feb. 28.—J. L. Workman. "An Exploration for Extinct Reptiles in the Rocky Mountain Plateau." Illustrated by lantern slides.

Feb. 28.—By members. "The Warblers of North America." Exhibition of specimens, with discussion of distribution, habits, etc., of yellow-throated, sycamore, Grace's, black-throated gray, golden-cheeked, black-throated green, Townsend's and hermit warblers.

WALTER W. GRANGER, Sec'y.

AMERICAN MUSEUM OF NATURAL HISTORY.

The Passenger Pigeon.

BALTIMORE, Md., Feb. 2.—*Editor Forest and Stream:* Noting your editorial in this week's issue, "The Wild Pigeon," will you kindly say why you call it "passenger pigeon"? It seems to me that other birds are as much passengers from one district to another district as were the pigeons referred to, and why you should call them passengers I would like you to explain. I can bear witness to their nesting in large numbers in Virginia when I was a boy—long time ago—but I also know that a species of bird—long bill—woodcock, snipe and rail were as much or muchly passengers as were the pigeon. Won't you please turn on the light as to "passenger pigeon," and oblige

E. S. YOUNG.

which rises from Mahmakanta, and its outlet is Pollywog Stream, which leaps down the mountain through a savage gorge. It is a wild, rocky stream and a dangerous channel through which to drive logs, but the lumberman's life is a constant struggle with the forces of Nature. We found old Louis at Mahmakanta, and while our guides returned to Rainbow for the rest of our luggage he took us up the mountain to the pond. A high dam holds the water back, and the gorge which forms the channel of the stream falls away from it so abruptly that the force of the restrained flood is enormous. Louis said he never could get men to go on the dam till the water was shut off, it is so dangerous. On the mountain side is another lonely grave.

Ansuntabunt, as seen from Nahmakanta, is covered with forest two-thirds of the way up, and then rises in great naked cliffs. Its name means, in the Indian tongue, "a mountain on a mountain," and it has that appearance. Pollywog Stream goes leaping down the mountain, a series of alternate falls and pools. We clambered down the ledges, pausing at the pools to cast a fly, and at picturesque points to photograph the wild beauty of the cascades.

We slept in the tent again that night, and made ourselves comfortable with a grand camp-fire of old pine stumps, for it was the coldest night we had. And now, as we have seen the Rainbow Country, and have departed from it, leaving it to its solitude and silence, we will say "good-bye" on the shore of Nahmakanta.

The story of the remainder of our journey, and of our dangerous adventure in the gale on Pamedomcook, has already been told. As I write, the maples about the house are tinted with the gorgeous colors of October, and every gust of wind sends a shower of gold and crimson to the ground. Far away I know that the mountains of Mahnagwanegwasebem are brilliant with the same varied hues, and that the colors splash and float in the silver water that laves the feet of the great hills. Now it is indeed the Rainbow Country, and the black growth intensifies by contrast the gorgeousness of the desidious trees. And the trout, also with the rainbow spots upon their sides, are awaiting our coming at some future day, and the little cabin stands deserted and alone in the clearing.

W. A. BROOKS.

"F. & S."

It is a gloomy, unprofitable winter day, with human companionship scarce and favorite books at a premium. At such a time my hand turns naturally to three little scrap books filled with sketches of nature and outdoor sport. The clippings are mostly from *FOREST AND STREAM*; wherefore the books are labeled on the back F. & S., with the numbers 1, 2 and 3. There was pleasant entertainment in clipping the best things from bulky stacks of the paper, to have them more conveniently at hand; in hunting up illustrations from among the work of amateur photographers in the same columns, and in other places where suitable pictures have abounded in these days of the universal camera and half-tone; and in fitting the picture to the story or description, and the whole to the waiting pages. And there is great satisfaction, of a dull day or a dismal evening, in joining one or another of these gifted nature lovers in camp, or hunt, or boat, or in some woodland, or waterside ramble, merely to see and hear. Here are stories true to fact, and others true at least to nature, poems redolent of outdoors, naturalists' observations, practical counsel in the arts of sport, glimpses of it in application, and a general celebration of the joys to be captured with gun and rod.

These books were made up years ago, when some of *FOREST AND STREAM*'s present valuable correspondents had written less, if anything, for its columns. Many good things had to be preserved in other form because of being on both sides of the leaf, with no duplicate copy to clip from; but the three little volumes hold a great store of charming reading, and they are not for sale, and hardly to be lent. The reader who can conveniently keep and handle the complete file will find some advantage in it; but if the pick of it is good enough for him the old reliable scrap book plan will show its good points, and there is the pleasure of working it up. If you use a book not intended for such service, half or two-thirds of the leaves will need to be cut out. If you are extra nice, you will cut off from the edges of the clippings the "rule," the line printed between columns. A streak of mucilage drawn along either edge of the paper fastens it, and does not wrinkle the leaf. It is easily applied without daubing anything by laying the clipping on the cover of a book, face down, with its edge along the edge of the cover. It is part of the fun to make the work reasonably neat and shipshape.

No contributor fills more space in these scrap books of mine, and none could deserve more, than Rowland E. Robinson. Among his little essays, unsigned, but unmistakable, are what I take to be his earliest contributions to the paper, such as the brief series entitled "Hunting Without a Gun." Here is his longer sketch with the same title, describing the writer's pursuit of his borrowed boat, and full of reminiscence and observation; and in similar vein, "Cleaning the Old Gun." Here are our Danvis friends, figuring in "The Hunting of the Wolf," and "Sam Lovel's Thanksgiving," and less familiar characters in the sad but artistic tale of "The Gray Pine." Story and essay, long or short, show how much a man can see in nature who has the eyes to see, and in memory and fancy when the bodily sight has, alas, deserted him. To this calamity Mr. Robinson alludes in a characteristic tone of philosophic resignation in one of the selections here preserved, "Voices of the Seasons," a touching speculation as to how far one without sight may judge the progress of the year by bird voices and other outdoor sounds. No one has better caught the spirit of the seasons. How finely is one of them epitomized in his prose poem on the muskrat and his house. Surely the reader will like to see these lines again:

"In the still, sunny days between the nights of its unseen building, the blue spikes of the pickerel weed and the white trinities of the arrowhead yet bloom beside it. Then in the golden and scarlet brightness of autumn the departing wood drake rests on the roof to preen his plumage, and later the dusky duck swims on its watery lawn. Above it the wild geese harrow the low, cold arch

of the sky; the last fleet of sere leaves drift past it in the bleak wind, and then ice and snow draw the veil of the long winter twilight over the muskrats' homes and haunts."

One of the books ends with a scrap of hunter's gospel from the lips of Sam Lovel. The reader sniffs the very aroma of the forest:

"It comes nat'ral for me to run in the woods. 'F I do get more game to show for it 'n' some does, I get suthin' besides 't I can't show. The air o' the woods tastes good to me, for 't haint b'en breathed by nothin' but wild creeturs. 'S 'n ole feller said 'at useter git up airly down in Rhode Islan' where my folks come from, I luffer breathe it 'fore common folks has. The smell o' the woods smells good to me, dead leaves 'n' spruce boughs, 'n' rotten wood; 'n' it don't hurt it none if it's spiced up a leetle bit with skunk an' mink an' weasel an' fox p'fumery."

This paper offered the natural field for Mr. Robinson's genius, and it would have been a serious matter to its readers if he and they had not somehow met.

Here, of course, are samples of Nessmuk, among them "A Chatty Letter" on some hunting experience in Michigan, and an extract from "Woodcraft" touching upon the same ground; also canoeing notes and glances into the deer runways in Pennsylvania and the Adirondacks. They fairly represent the mixture of amusing adventure, practical wrinkles and fine sportsman sentiment to which Sears' sprightly style gave such an inimitable charm. Listen to his protest against the game hog—I am sure the old man would be glad to have it again laid before us:

"My sporting friends, will you heed a little logic from the standpoint of fifty years' experience? You work eleven months in the twelve at desk or bench. All through the year you are looking to an outing; a chance to get away for one, two or three weeks' vacation. You know and I know and we all know that you need it and deserve it. But why, in the name of all sense and reason, should you boast of 'bags' and 'baskets'? About how much, on an average, do you require of animal food, say, in twenty-four hours? If you kill more, why and wherefore? The man who brags to me of 'bags' and 'baskets' just tempts me to 'shoot him on the spot.'"

Here is a copy of the fine bronze tablet which in one way perpetuates Nessmuk's memory. Facing it is James Whitcomb Riley's memorial sonnet, and elsewhere Robinson's more poetic prose tribute, written a year after the veteran's death.

I was lucky enough to clip two of the contributions of Robert T. Morris. Would there were more. "Watching the Brant Grow Big" is ideal material for a sportsman's journal. There is nothing better in the books. Take this glimpse from the bayside blind:

"From out the west a merry flying rabble appears, buffeting the winds, caring naught for the cold. A rabble of warm birds that on even line head down the bay with hurrying wings and outstretched necks, chanting as they go, and in good company. * * * To-night, when all is still in the cabin, you may hear those voices of the morning when no birds are near. When you are at home in the city a strange weird music will come as you sit before the grate fire in the twilight. The chimney winds have caught the cadence of the voices of the brant, and looking into the gloom of the room you will see again the moving wings that float adown the ceiling."

Just beyond comes "The Autocrat of the Eddy," in which clever prose and verse preserve some of the delightful things that the angler sees and does. More power to the elbow of Dr. Morris. Long may he wave the fly-rod, the double-barrel and the pen.

Robert B. Roosevelt is another who here celebrates the attractions of the Great South Bay. He wrote charmingly of fishing and bay bird shooting years before the Rough "Riders" footed it up to Santiago and made Teddy a bigger man than his uncle. And among the briefer bits is still another, "My First Wild Goose," by Bay Ridge, that takes one to the same favorite waters. "Shinnecock Lighthouse loomed up cold and gray way down over the rough water of the bay, and as we were looking that way we spied two geese slowly forging up against the wind, low down, close to the surface." There is a picture calculated to stay with the reader, as it doubtless did with the writer.

T. S. Van Dyke was writing oftener in the days when these sketches were clipped, and he got into one of the scrapbooks, to its enrichment. Here is his account of "Lassoing the Grizzly," that unique style of California sport, and here are his reminiscences of the duck hunters' heaven at Senachwine Lake, where the big birds came only too thick and fast. No writer has a surer place in American sportsmen's literature than Van Dyke.

My shears and mucilage captured some of Wilnot Townsend's short but sweet recollections of the woods and waters, and a couple of Paul Pastnor's. Seneca is here with "Leaves from a Log Book," interesting to me partly because I too had boated on the waters where the log book found its material. On another page a friend of his and mine tells about Seneca's traits and his outings, which bore fruit in "Canoe and Camp Cookery." I harvested also certain of Kelpie's camp-fire sketches, and some of the brightest "flickerings" from that other "Camp-Fire" into which the jokers tossed their merry memories and inventions from time to time. Orin Belknap tells with "ghoulish glee" how "In Territorial Days" he circumvented a flock of geese in the gloaming, and in another "Chapter of Hunting History" how, after killing some deer, he bent the deadly old Sharps by an accident, far from gunsmiths, and was disconsolate until he found he could straighten it at the ranch by his own gumption.

There was darky dialect in *FOREST AND STREAM* before Major Mather's, and here are a couple of clever bits by The General, namely, "Uncle Isiah on the Hammerless," and "A Story of 1864." Brother Hough of "Chicago and the West" (and East and North and South) dropped into it in an unguarded moment, and the result fills out very pleasantly between some longer selections. He had not then given the clipper so many chances as he now has, and his only other representative in these collections is one of the "Singing Mouse Stories," the one containing the fine "Atlantis" poem. If Brother Hough were not so much absorbed in purveying the serious information which the public necessarily yearns for, and could oftener give flight to his genius, he would be more clippable, if less useful.

Fishermen's yarns, of course, have place here. Among them are the remarkable narrations of A. W.'s "Chance

Acquaintance," with special reference to pickerel, and Fred Mather's story of "Cooking a Trout in Camp." The redoubtable Major was not then running the yarn mill on so full time as in later years, but one suspected from a mere sample what he could do if he tried. Wayway-anda in "What Luck?" points out beautifully the things that the angler catches without rod or line, and elsewhere discourses more practically of black bass fishing. I could not forego such a complete little bit as "Kellup's Trout," by Jefferson Scribb, and I would not have missed "The Last Trout," by the champion of all the trout story tellers, "Adirondack" Murray. In this he is at his best, as again in a rhapsody on "Outdoor Life," in which he salutes the fraternity:

"Mild-mannered and light-hearted wanderers, boys with smooth or wrinkled faces, gray-haired some of us, but boys still, thank God, canoers, campers, yachtsmen, our fires are lighted on a thousand shores, and our evening song floats over a thousand lakes and island-studded rivers. We are a family of nature's saints. Our spirits have been touched and softened by the sweet grace of nature. We have been indoctrinated in the truths that shine out of stars, and which the blue heavens declare at noon and night. * * * All hail! ye healthy-bodied, healthy-minded, kindly-hearted, gentle-mannered saints of flood and field, of hill and river, of oar and sail, of deck and camp. Your smiling faces rise before me in thousands, and your voices, in happy talk, in joke and song, come from afar and stir the silence around me into laughter. Joke, laugh and rest on, ye thrifty vagabonds and gentle loafers; into each hour you are storing the honey of health, on which, in future days of toil and strain, your strength shall feed and fill itself with vigor."

Writers for sportsmen are not usually so happy in verse as in prose, but I found some such poems worthy of their company. A few satirize the trout fisher who comes home with purchased fish or none. In one Nessmuk relates his tribulations with an uncatchable big one. Two or three from the Atlanta Constitution sing the praise of "Fall Time in Georgia" like this:

Fall time in Georgia
Comes but onct a year;
Ketch the possum by the tail,
Or ketch him by the ear!
But ketch him,
O, ketch him,
An' 'crost the griddle stretch him;
Be certain that you fetch him,
For it's only onct a year!

Or this:

O, the meller, yellor autumn, or the fall, or what you please,
When the gold is in your pocket and is growin' on the trees!
An' you hear the partridge whistle, an' you hear the rifle ring,
An' the doves they come a-tumblin' as you take 'em on the wing.
Let 'em run!
Get your gun,
An' you'll fetch 'em every one!
It's fall time in Georgia,
An' the boys are havin' fun!

Bret Harte's "Grizzly" follows Van Dyke's article above mentioned. One of the books is introduced with some good lines from McGaffey's "Poems of Gun and Rod," including these:

And leaps my blood again, as one by one
The old days rise, while nature's Circe-strain,
That lures men on mid sun and wind and rain,
Comes back to me o'er harps of tangled grass,
And sets me dreaming of the rod and gun.

Then comes a ringing poem by Maurice Thompson:

Ho! for the marshes, green with spring,
Where the bitterns croak and the plover pipe;
Where the gaunt old heron spreads his wing
Above the haunt of the rail and snipe.
For my gun is clean and my rod's in trim,
And the old wild longing is roused in me.
Ho! for the bass pools cool and dim!
Ho! for the swales of the Kankakee!

Next appears the one lapse into poetry which Mr. Robinson has attributed to Sam Lovel, and which to be sure has the Lovelian twang, as where he says:

When the wild goose arer is a-shooting from the cold,
'Tain't the time o' year 'at a hunter grows old;
When the crickets creaks slow an' the nights grows cold.

The selections here mentioned are chinked in with many minor bits almost as good, each with its own claim of literary charm, or fidelity to nature, or essential interest of subject, or wholesome humor, to justify its preservation. It is rather aggravating when other men sneak off and do our hunting and fishing for us while we are "chained to business," but we may forgive them and even thank them when they tell us about it so well.

BRISTOL HILL.

Stupidity of the Ruffed Grouse.

Editor Forest and Stream:

Many of your readers have perhaps heard that a whole covey of grouse can be shot out of a tree by each time selecting the lowest bird. But this bird's stupidity while on the ground was proved to be no less surprising by Thomas Newton, who lives two miles from Central City, W. Va. He discovered five of these birds under a cedar tree eating the berries that had fallen. At the time there was a few inches depth of snow, but the ground was quite bare under the tree. He shot five of them successively with a rifle at 50yds. distant. He took "rest" to make sure, aiming with perfect deliberation. When one would be in the throes of death the others would exhibit excitement very similar to that of domestic fowls over a decapitated companion.

N. D. ELTING.

Lynx in Essex County, New York.

ELIZABETHTOWN, N. Y., Jan. 31.—*Editor Forest and Stream:* A large Canada lynx was shot and killed within two miles of this village at 1 o'clock P. M. to-day. The animal was shot by Robert Hays, near the residence of A. L. and E. G. Jenner in the town of Lewis.

GEORGE L. BROWN.

The Ascent of the Grand Teton.

ST. PAUL, Minn., Jan. 24.—*Editor Forest and Stream:* In my letter to FOREST AND STREAM published in the issue of Nov. 19, 1898, I presented evidence which showed conclusively the falsity of many portions of the affidavit of Thomas Cooper, concerning his ascent of the Grand Teton in 1877. There were yet in his artfully prepared affidavit other material allegations, which every member of the United States Geological Survey in that field of work in that year (1877) knows to be false; but the proof of their falsity was not then in my possession. This final evidence I am now enabled to present.

Mr. Cooper, in that affidavit, swears that he and his two companions found the circular inclosure of rocks on the northwest slope of the mountain, where he (I quote) "left a can containing a slip of paper which bore our names," and that he read an aneroid which showed the elevation, etc. If Mr. Cooper left a can there in 1877, it is pertinent to inquire why the can was not found by Mr. A. D. Wilson, of the United States Geological Survey, who went up the mountain in August, 1878, and who was the first person to follow Mr. Cooper to that point, and who carefully searched for some evidence of a former ascent. His failure to discover the can is now accounted for in the fact that no can had been left in the inclosure. Mr. Cooper's memory, seemingly, is not always faithful to the truth. We may note as a fact, which throws doubt upon the truth of his affidavit, that not one word of his remarkable statements was heard by any member of the United States Geological Survey until after the death of the three principal actors named, Hayden, Stevenson and Bechler—the death of Mr. Bechler having occurred about three years ago. With all possibility of contradiction by either of these three men removed, and with Peter Pollock, the cook, in obscurity, there was, to all outward seeming, no one who could disprove any affidavit Mr. Cooper might be induced to sign, relative to the acts of the climbing party. But

"The best laid schemes of mice and men
Gang aft a-gley."

There is one man still living who has been forgotten by Mr. Owen and Mr. Cooper. That man is Mr. S. J. Kubel, now the chief engraver of the United States Geological Survey—a man of high character and perfect reliability, and whose word will be disputed by no one.

It was Mr. Kubel, and not Louis McKean, as stated by Cooper, who went up the Teton with Pollock and Cooper in 1877. Mr. Henry Gannett, Chief Geographer of the United States Geological Survey, writes me:

"Mr. Kubel is a very cautious man," and because of his cautiousness he has been averse to adding his testimony on any point involved in this controversy to that already furnished, until such time as he might prepare, in all its details, a full record of that expedition up the Teton from his diary of that year, which he says he has mislaid. But the assault on the character of his old comrade, Capt. Stevenson, contained in an affidavit which he knows is untrue in every essential statement relating to the climbing of the Teton in 1877, and including the statement that Cooper had any authority over Bechler, has led him to respond to my inquiry; and while he reserves the right to add additional corroborative details when he recovers his diary, he shows that Mr. Cooper did not state the truth in his affidavit. He says that they found no slab inclosure on the mountain; that they had no can; and he is positive that Mr. Cooper had no aneroid. In all these particulars he flatly contradicts Mr. Cooper. His letter will be found below.

It is evident that Mr. Cooper did not prepare his own affidavit. He may be catalogued as a man who generally speaks the truth, and is therefore regarded as honest; but the world abounds with just such men, who, having convinced themselves that a certain thing ought to be true, do not think it wrong to originate and manufacture, or to join with others in originating and manufacturing, additional evidence, for the purpose of convincing others.

Lord Macaulay says that when Charles the First was charged with having broken his coronation oath, the defense was that he kept his marriage vow. When charged with surrendering his people to the merciless cruelties of hard-hearted prelates, the defense was that he took his little son on his knee and kissed him. When charged with having violated the articles of the "Petition of Right," after promising to observe them, his defense was that he was accustomed to hear prayers at 6 o'clock in the morning.

The defense of Mr. Cooper, as presented, is equally irrelevant and frivolous. When charged with having falsely sworn to a libelous statement, defaming the character of Mr. Stevenson, who is dead, the defense is that he is respected as a citizen of Cheyenne; and his friends claim that this respectability is of a quality and essence so super-eminent and notable that it bars out all positive proof which has been or may be produced in a specific case to show that his affidavit is not true.

Rev. Frank S. Spalding, rector of St. Paul's Church, of Erie, Pa., accompanied Mr. Owen to the summit of the Teton. It will not be denied that his judgment on this question is entitled to as much respect as that of Mr. Owen, and I have frequently been asked what was his opinion. Mr. Spalding has taken no part in this controversy. He wrote me on Jan. 18 that he believes that I reached the summit, because I say that I did, and because the difficulties of the ascent were not great enough to have prevented any good climber from having successfully scaled the peak.

In a former letter Mr. Spalding wrote me that on a wagon ride from Market Lake to the Teton Valley, in August last, Mr. Cooper told him that in making his ascent in 1877 he approached the peak from the west side, but that he found the slab inclosure on the northeast side, and that it was not the inclosure found by Stevenson and myself. This statement of Mr. Cooper to Mr. Spalding does not accord with that in his affidavit, wherein he says he found the inclosure on the northwest slope.

Thus it will be seen that the little that is incidentally and inconsequentially true in Mr. Cooper's affidavit is so nearly eclipsed that which is not true that the true is hardly discernible.

Gov. Richards thinks that I have not fairly construed

his statement relating to the question whether Beaver Dick (Richard Leigh) was or was not one of our ascending party. He says: "I did not assert that he was. I have always understood that Stevenson and Langford constituted the party who made the ascent at that time."

I still think that the language of Gov. Richards' statement in FOREST AND STREAM of Nov. 5 justifies my interpretation of it, viz., that he thought that Beaver Dick was one of the ascending party. Otherwise it has no force in Mr. Owen's argument. Gov. Richards, in his affidavit, says that my Scribner article was submitted to Beaver Dick, and was read, etc. In that article I say that our ascending party numbered fourteen persons. Gov. Richards also says that Beaver Dick stated, "after reading said article * * * that he was one of the party, and knew just how far up the mountain said Langford and Stevenson had gone."

I think that this language implies that Beaver Dick was one of the fourteen who tried to scale the Teton; but as Gov. Richards did not intend to make such a statement, I now readily accept his disclaimer; but with it must fall Mr. Owen's argument that Beaver Dick was in a position to know "just how far up the mountain said Langford and Stevenson had gone."

Gov. Richards will bear in mind that I have never questioned his integrity. As I wrote in my former letter, I have entire confidence in his truthfulness and honorable intentions. I have equal confidence in the truthfulness of Beaver Dick, and I therefore feel sure that if Gov. Richards ever had an interview with Beaver Dick such as he describes, then he certainly misunderstood what Beaver Dick said to him. So believing, but with the purpose of more fully assuring myself upon this point, I wrote to Beaver Dick, asking him to state the facts. His letter in reply is given herewith. It breathes the very soul of truth, frankness and blunt straightforward honesty.

It will be seen that Gov. Richards' memory of events which took place twenty-four years ago and Beaver Dick's written diary for that year (1874) are not in accord. Beaver Dick states that his diary shows that he saw but three persons (whom he names) in the mountains during the summer of 1874, and that he was on his ranch, which is on the west side of the Teton range, until July 2, on which day he started for Eagle Rock Bridge (a full day's journey), where he remained, making purchases, until July 4 at noon, when he started for home, arriving there July 5. The point on Salt River where Gov. Richards had his interview with some person is seventy-five miles "as the crow flies" southeast from Eagle Rock Bridge.

Beaver Dick's diary and statements in his letter furnish the best of documentary evidence that it was some person other than Beaver Dick with whom Gov. Richards had his interview "on or about June 30, 1874, on Salt River."

I do not seek, as said by Gov. Richards, to "impeach this witness," but the testimony of the witness that he did not make the statement imputed to him must be received. There is no reflection on Gov. Richards' integrity in the fact that after the lapse of twenty-four years he does not recall the exact details of an event of which he perhaps made no memorandum at the time they occurred.

NATHANIEL P. LANGFORD.

Letter of S. J. Kubel.

DEPARTMENT OF THE INTERIOR, United States Geological Survey, Washington, D. C., Jan. 18.—Mr. N. P. Langford, St. Paul, Minn. Dear Sir: I am in receipt of yours of the 10th inst., in the matter of Mr. Cooper's statement concerning the ascent of the Grand Teton in 1877.

Speaking from memory and reserving the right to add to these notes in case I should find my diary of that trip, which just now is mislaid, I will say:

1. That Mr. Bechler was in charge of the surveying party.
2. Tom Cooper, Pete Pollock (cook) and myself ascended the mountain—not Cooper, Pollock and McKean, as stated in Cooper's affidavit.
3. We found no slab inclosure.
4. We left no can; we brought none to the mountain.
5. I never saw Cooper have an aneroid, and am positive that he had none on the Grand Teton. Very respectfully,
S. J. KUBEL, Chief Engraver.

Beaver Dick to N. P. Langford.

WILFORD, Idaho, Dec. 27, 1898.—To N. P. Langford. My dear Mr. Langford: Yours of Dec. 12 to hand and contents noted. I was very glad to hear from you, but sorry to read about the trouble concerning the Tetons. I will answer your questions truthfully, as I cannot do anything else. I was camped at our old camp grounds in Jackson's Meadows when Mr. Owen and party got to the top of the Grand Teton, and as I see in publications that Gov. Richards states that I told him I was one of the party that scaled the Teton in 1872, what I have to state is, to the best of my knowledge I never saw Gov. Richards in my life, let alone speak to him, and there are scores of people in the past seventeen or eighteen years who have asked me questions about climbing the Grand Teton, and I solemnly swear here that I never told any man, woman or child that I was one of the climbing party. What I always told when questioned was the truth. I was sent on a side trip, with Shep Medary as my assistant, to see if we could get to the Middle Fall River pass from our present then camp without having to cut too much fallen timber out of our way, as there had been a large fire two years before. I was gone three days, and when we got back the Teton had been climbed, and I congratulated the Captain and Gov. Langford, as we called him, for getting to the top, as I had told them frequently I did not think any one get there without artificial means. My reasons for saying this were that I had been to within half a mile of the Saddle several times hunting sheep, and from where I was it looked too steep for climbing, but I was glad when every one told me the Teton had been mastered, against my predictions.

If Gov. Richards ever did see me and talk with me, which I have no recollection of (and my memory and faculties are as good as in 1872, although I am nearly three score and ten, lacking one year from Jan. 9 next), he must have misunderstood me. But I have no recollection of him. There are scores of people who, if they see this statement, will know my statement is correct, as to

me being one of the climbing party, for I was not and never told any person that I was, for I and Shep Medary were some fifty or sixty miles north of our then camp, on duty, that day the Grand Teton was climbed.

I have looked over my diary for 1874. I find the only persons I saw or met in the mountains in that year were William Burns and his wife and John Reynolds. They had crossed from the South Fork of Snake River, the Teton Mountains south, and come into the Teton Basin. They were trapping. This was June 23, 1874. On July 2 I went down to Eagle Rock Bridge, to the Anderson Bros., to buy some ammunition for my son Dick and to get a pair of gum boots for Bill Burns. I left Eagle Rock on July 4 at noon and got to camp on the 5th. I went hunting with Burns the next day to get meat for camp, and on the 7th he and his wife started for the Yellowstone River. So I cannot see how I could tell Mr. Richards what he says I did. It may be he has forgotten the year, for I cannot believe that he told a willful falsehood.

As I said above, my memory and faculties and my nerves are very good for a man of my age, sixty-nine Jan. 9 next. You can see from my writing that my nerves are in fair shape. I have had to wear spectacles for the past six years. My homestead is thirty miles from the Grand Teton. We can see it and all the Teton range from here, and it is a grand sight.

RICHARD LEIGH,
or better known as Beaver Dick.

Natural History.

The Service Berry.

THE service tree which bears the service berry about which Col. Fred Mather inquires, is very common in West Virginia. When I saw his question in FOREST AND STREAM I felt like a boy in school who has been missing everything and hears a question he can answer. My hand has been in the air ever since, figuratively speaking, until I just have to blurt out an answer.

We do not say service. If we did our superiors in wood lore would think we were putting on too many "blossoming frills." We conform to the good strong language of our neighboring neighborhood and speak of the "sarvis berry," and as it not infrequently occurs, come nearer in this homely manner to the Latin name for this tree. The name service is a corruption of *Sorbus*, for the tree was common in Italy and deserved a name. They called the fruit *Sorbum*. In southern Europe, I have heard somewhere, the cultivated tree bears a fruit as large as the pear. To classify it, the wild service is the *Pyrus torminalis*. To the genus *Pyrus* belongs both the apple and pear. But away with Latin, which you have to look up in a book. Except for purposes of identification, it is both useless and irritating. Besides, if the truth were known some of our high flung Latin terms would fare badly in polite society. Just let us expose that rank impostor *Pyrus torminalis*. It means simply, "A five-celled fruit which is good for the bellyache." Let us eschew Latin and try to give the subject that touch of nature which is the main end of FOREST AND STREAM literature, the mere reading of which conjures thoughts of the woods like the scent of smoke in the clothes you wore camping last summer. The sarvis is the first tree to bloom in the spring. The bush or tree with its white blossoms dots the sides of our mountains and ridges, and the old folks say it is time to sow oats, just as they say a month later when the dogwood gets white that it is time to plant corn. The Indians planted corn when the black walnut leaves were as big as squirrel ears.

Then the small boy locates the trees, which have a way of hiding at other times. For of all berries that grow, tame or wild, the sarvis is the best to eat. Sometimes a tree will have fruit as large as cherries, but generally it is about the size of a pea. We were about to say a ball in .32 cal. pistol cartridge, but what an outrage that would be to botanists. Strange to say, this delicious berry has never proved to be worth cooking or preserving. About June 1, at my home, or a month later, in the mountains back of us the berries are ripe. Then the young ones, and old ones too, for that matter, form parties, take an axe, and go to the trees they have marked when the bloom was on. The trees are tall and slender, and the boughs are brash. It is hardly conceivable to those unacquainted with the facts that a tree found loaded with berries looking greatly like a cherry tree is cut down in order that the berries may be eaten. But that is the way sarvises have been eaten for a hundred years, and no one thinks anything of destroying for one crop a tree that has been growing for many years. Well may the tree hide its slender forms in the thickness of the forest!

It is a little singular that Col. Mather should have asked about the sarvis in an article under the head of fishing, he knowing nothing about the tree. Every fisherman here has associated the tree with fishing. Black bass have been known to eat the berries that fell in the water. The tree is at its best hanging over a mountain stream. The fruit has an opportunity to get the sunlight that it needs to become sweet and palatable, and the fisherman stops and pulls down the boughs until he has a "mess of sarvises."

By the way, sarvis is good Virginia language for the word service in its other meanings. Where is the man who first taught children that bears cannot climb a small tree, and caused the little ones to plan, when in the woods, how they will climb a sapling in orthodox style when the long expected bear comes along? He is hereby informed that a bear would climb a greasy pole for a mouthful of sarvises. There is no sarvis tree too tall and slim for a bear to climb and bend down, or break the boughs, in eating the fruit. I have seen good sized trees literally torn to pieces by bears until it looked like lightning had been at work on them.

Two friends of mine once had the good fortune to see a bear in a sarvis tree near the bank of a trout stream. They heard the branches breaking, and about the time they located the animal well and were wondering why they had left their guns at camp, the bear saw them and

fell out of the tree bodily in his haste and astonishment, and left, nor stood upon the order of his going.

ANDREW PRICE.

MARLINTON, W. VA.

"Them Berries."

A letter from a correspondent in Rensselaer, N. Y., who does not wish his name given, says: "About them red berries with a hole in there ends that you wrote a piece about I can tell you is juniper berries cause they grow on juniper bushes but I allers heerd they was pizon to eat but was good to make gin with. Theys not many now about the harrowgate spring as all the brush has been cleared off and theys a brick-yard there, but some of them berries is still found down in Teller's woods and up back of the Denison Farm. I aint seen none for over twenty year but they must be there. Charley Melius showed me your piece and I remembered you when I was a little boy and you gave me a fish line and a lot of bait when I had fell off the dock and lost mine. If I can find some of them berries next year will send some."

Here is a case of things cast upon the water and returning after many days. There is no recollection of the donation of a fish line and a stock of worms some fifty years ago, still it might have happened, and then passed into that oblivion where most of the things we did in the past have gone. Our memories are so crowded with events of the past that they overflow, and at middle age much is lost. What remains is a melange of sense and nonsense. Of a schoolmate who is now a learned judge, his name always recalls his boyish remark, "It's too bad that we've got to take off our clothes at night and put them on in the morning." As a boy I thought this funny; to-day it indicates the philosopher in embryo. My grandfather died at ninety-eight years old, and longed for death to come, so that he would not have to put on his shoes in the morning; that was all that life meant to him. But as usual I've run off the track.

The juniper berry is not a soft berry; it is not red, but has a bluish cast. I know it well. It is round and smaller than the berry that I wrote of, and is not edible. That it is used to give gin its peculiar flavor is almost too well known to refer to, and my old friend A. R. Fuller, who kept the Meacham Lake House, in the northern part of the Adirondacks, told of an old duffer who went to a druggist in Malone and said: "I want to get some juniper berries to make my gin a little more ginny." This is a hint to those who like the flavor of the juniper. But the "cedar berries" of my boyhood were not juniper berries, no man could eat the hard things, while my berries were soft, crimson, pulpy and sweet.

Here is something near the solution; Mr. John Preston True writes from Boston as follows: "In the woods about one and one-half miles south of the village of Bethel, Maine (Oxford county), will be found a low shrub, squat, like a small hemlock, without a top, which a fat bear—or an editor—has sat on. The foliage is hemlocky, on the end of the twigs are salmon-colored berries just as you describe them in FOREST AND STREAM, with the stone exposed. As I recall them, however, the berries are much smaller than your quotation—say two-thirds smaller. We boys called it ground hemlock; imagined it to be the Indian poison, and shunned it accordingly. As you are still flourishing, it is clear we were wrong. How do they taste?"

Dr. H. H. Montgomery, Pitcairn, Pa., sets me right on the service berry, which as the "shad blow" has been before my eyes since boyhood, but I hope to be dingswizzled if I ever saw any berries on it. He says: "Your letter in FOREST AND STREAM of Jan. 21, in which you ask 'but what is the service berry?' carries me back more years than I care to count to my boyhood days, when from the city I went out to the old homestead on the banks of Crooked Creek to spend my vacation. I happened to be there once in the early spring, and on the hills which line both banks of the stream were every here and there a tree, some hardly more than a small sapling, others 30 to 40 ft. or more in height, and 1 ft. perhaps in diameter, and all literally covered with white blossoms, standing out conspicuously among all the other forest trees upon which the leaves had scarcely begun to shoot.

"Then I have been there in late June and early July, and the white blossomed trees would be covered with a red or purplish red berry about the size of a large currant or small cherry. Those berries, Colonel, were and are the service berry you are in doubt about, commonly called the June berry—the *Amelanchier canadensis* of Torrey and Gray, and the *Pyrus botryapium* of Linnæus.

"For twenty-five years there has not come one spring that I have not longed for a mess or twenty messes of June berries or 'sarvis berries,' as they were often called, and some of these rare June days—may be this year, may be next year—I am going back to the banks of old Crooked Creek. I am going to climb the biggest sarvis berry tree I can find, and I am going to fill my tank with a berry before which the raspberry or strawberry or almost any old berry fades into insignificance, and then I am going to slide gracefully down the tree and go down below to a 'fishing hole' I know of to a riffle. There I will catch some crabs, and with their tails bait a hook, a good big hook, tied to a good stout 'seagrass' line, and the line fastened to a long cane pole, and I am going to catch some bass in the hole, five great big whoppers, and one of them is going to get away from me after jaggng me with his dorsal spine, meanwhile almost breaking my heart for fear he will get away.

"Then I am going to eat a lot more berries and lie down in the shade of a big rock I know of, and try to imagine I am only twelve years old, and that this is one day when I did eat the berries and did catch the fish almost as long as my arm, and didn't want a thing more in this wide world except more berries and the fish that got away.

"Now, Colonel, I thought that a man who knows so much about so many things ought by rights to know 'service berries' also, and that is my excuse."

No excuse needed, Doctor. I asked for information and it came. It comes again further on, but this note recalls a nursery rhyme about a fellow who was "born in the woods and scared by an owl." So much for common names; if we boys had once found the berry we would have called it "shad berry," as we only knew the

tree as the "shad blow," coming with the first shad, but I want to be kicked, I feel contempt for myself. And, before this, to me unknown berry, "the raspberry or strawberry or almost any old berry fades into insignificance." I cry "peccavi," having gone through the woods thinking my eyes and ears were wide open. I saw but never heard the shad blow.

As a scholarly angler, Dr. Montgomery has met Izaak Walton's quotation from Dr. Bottler, who said: "Doubtless God could have made a better berry than the strawberry, but doubtless God never did." Next summer, when he gorges upon his beloved "sarvis" berry, I hope he will bear the quotation in mind.

This berry question will stir up others to write about it. While others tell what the service berry is, none mention its edible qualities except Dr. Montgomery, whose enthusiasm in placing it above all other berries puts it in a new light. Let us cultivate them, put them on the market, as has been done with other berries. Fifty years ago there were no cultivated berries, our limited supply was from pickers of wild fruit. With the exception of the huckleberry, there are no wild berries that come to New York. If not "chained to business" next June, I will look for the "service berry" and eat it with the notes of Dr. Montgomery singing a thrush-like melody as they glide down my esophagus.

As a full and complete answer to my many descriptions of berries, from the "cedar berry" of boyhood, which has never been met since, to an exhaustive treatise on that and others which I imagine might be the "service berry," the following from my comrade, Frank Robinson, late U. S. N., now of Philadelphia, is so complete and exhaustive that I give it in full.

"Col. Fred Mather: With some hesitation I attempt to answer your question propounded in the issue Jan. 21 of FOREST AND STREAM, thinking that you would be flooded with answers, any one of which would fill the bill. And then, if every one who knew thought the same, you would not be enlightened. I am influenced also by the fact that your experience in regard to two of the berries is very like my own.

"The bush that you describe as growing in a ravine near Greenbush, that bore berries that John Atwood called 'cedar berries,' is *Taxus canadensis*, American yew—popular name, ground hemlock—and is a variety of the European yew, *Taxus baccata*. Your description of the berry is excellent, as I remember it, for I have not seen it since I was a boy in Maine, and I am now over sixty-two years of age. I have never found over two or three individual specimens of it, and have been roaming the woods with my eyes open all my life when opportunity offered. The difference in manner of growth between the European, Irish and the American yews is very striking; the two former growing upright, one with a thick trunk, the other, the Irish, making a narrow column; while the American variety grows low and spreading, the bush itself being somewhat cup-shaped and depressed in the center like the berry. It was common report among us boys that the berries were poisonous, and I never tasted them until one day, when watching the movements of a red squirrel, I saw him go into the bush and eat the berries, which exploded the question of any poisonous properties, and thereafter I ate them. The Botanies do not describe it as rare, still, like you, I have found it so.

"In regard to the other berries mentioned in the article, I think I can set you right. The common and popular names of plants and berries are just as confusing as those of fish and animals, the same name being applied to widely different things in different localities, sometimes not very far remote either, and the only remedy is the one you have frequently insisted on in regard to fish, and that is to learn the scientific name and call it by that, and educated people will know what is referred to, and others will in time pick up something of it.

"Referring to the wintergreen berry, also known as checkerberry, teaberry, boxberry and ivory plum, the last probably from the ivory whiteness of its substance, the botanical name is *Gaultheria procumbens*, named for a Dr. Gaulther, of Quebec, over 150 years ago. The specific name *procumbens* alludes to its creeping habit of propagating by underground runners; the foliage yields the well-known oil of wintergreen. There is a western variety that grows as a spreading shrub. It belongs botanically to the Heath family, of which the European heather and the huckleberries are familiar specimens.

"The service berry is not either the squaw berry or the bunch berry, as you infer. Botanically, it is the *Amelanchier canadensis*, and is common everywhere, at least through southern Canada, the Eastern and Middle States. There are several varieties, but they run together, so that botanists are inclined to regard them as forms of one. The variations run from shrubs to small trees with slight distinction in the foliage, but the berries of all are nearly identical. It belongs to that great botanical family known as the rose family, of which the queen of flowers is the type, and is closer related to the apples and pears, so much so that *Amelanchier* stocks have been used for dwarfing the pear by grafting on it; as in dwarfing the pear by grafting on the quince. I have used them for this purpose myself. It flowers in spring, producing in June (and therefore in some localities called June berry), a berry-like purplish fruit in shape something like a rose hip— $\frac{3}{8}$ to $\frac{1}{2}$ in. in diameter—edible, sweet and sometimes very pleasant flavored. The popular name of the European species in its home in Savoy means service berry, and the name was probably attached to our American species by the early Canadian settlers and has stuck. It is called in some parts of New England wild pear, and in others shad bush, from the fact of its flowering about the time the shad come up the rivers. As the white beach is accounted the best material for making carpenters' planes, so the tree form of the *Amelanchier*, which is the variety usually called the wild pear (never, I think, over 3 or $3\frac{1}{2}$ in. in diameter) is held in high esteem among mechanics for chisel handles.

"The squaw berry 'with two eyes' is botanically the *Mitchella repens*, the only species, and was named for a Dr. J. Mitchell, who corresponded from Virginia with Linnæus. I have found it growing sparingly and scatteringly everywhere from New England to Pennsylvania and New Jersey, never abundantly but once, and that was last summer, near the center of Camden county, N. J., in the town of Clementon, where in low shady woods

the ground was covered with it and red with the berries, and boy-like I filled my pockets with them. It belongs botanically to the madder family, of which the *Cephalanthus* or buttonbush may be familiar to you, though none but a botanist would detect any resemblance between the two.

"Lastly comes the bunchberry; this, like the American yew, I haven't seen since I was a boy in Maine, where in certain localities it was quite plentiful—notably about decaying white pine stumps of large size, where the ground would be covered with it. It is botanically *Cornus canadensis*, dwarf cornell-bunchberry. The *Cornus florida*, flowering dogwood, with which you are no doubt familiar, and which blooms about the time for planting Indian corn, and forms such snowy masses of bloom in the landscape before many of the trees have gotten their foliage, is a near relative; and while there appears to be a wide and mighty difference between the humble bunchberry and the stately dogwood, still, if the blossoms of each are examined, you will see the same petal-like involucre to each and the fruit is not dissimilar, and each have the same hard seeds, though the bunch berry has the most pulpy and edible fruit. The stems of the bunchberry spring from running underground shoots and are surmounted on the top with a whorl of four to six oval leaves, on top which in spring appears the cluster of blossoms, with the petal-like involucre underneath, spoken of above.

"In reviewing this, it looks as if I had used a good many words to answer a few simple questions, and reminds me of what the emaciated Irishman told the doctor who was about to apply to his body an immense mustard plaster, 'It seems to me there's a dale of mustard for a little mate'; but if you are able to glean out the little meat there is in it, I shall feel repaid as rendering some small compensation for the vast amount of practical information I have received from your interesting articles in FOREST AND STREAM. And generally when a man wants to know about anything enough to ask, he wants to know all about it, which I have tried to tell."

Comrade Robinson has shown that the squaw berry and the bunch berry are not other names for the service berry; and these botanists find resemblances where we, who consider each plant as an independent growth, never would. They aver that the little edible bunchberry is closely related to the flowering dogwood. I have eaten thousands of bunchberries, but the seeds of the dogwood are too hard to eat. I know the wild rose and have tasted the berries, or haws, but never cared to eat them. I can believe that I have seen the service berry, but it is possible that it never tempted me to eat it. The "shad blow" I know very well, but if it has an edible berry, I never stuck a tooth in one, and so the "service berry" grows on the shad bush! "It's never too late to learn."

An old correspondent of FOREST AND STREAM, Arefar, of California, writes me that the "ground hemlock" which grew my "cedar berries" is closely allied to the English yew, from which the famous bows of the English archers were made. After describing the service berry, as Comrade Frank Robinson has so exhaustively done, he says: "We also have a Pacific Coast variety, *Amelanchier alnifolia*, which reaches its greatest perfection along the rich bottom lands of the Columbia River. Its berries are an important item of food with our Western Indians, who gather them, reduce them to a paste, and dry them for winter."

FRED MATHER.

Sarvis Berries and Buffalo Ribs.

BROWNING, Mont., Jan. 24.—*Editor Forest and Stream:* It seems hard to believe that there should be any one who does not know what sarvis berries are. To us who live up in the Northwest they are as well known as oats, or corn, or potatoes, and in many sections of the country are in their season a good deal more abundant. Another name for them is saskatoon or sascatum berries, no doubt the name for the berry in some Indian tongue.

The genus to which the plant belongs is widely distributed through the north temperate zone. It is found in eastern and western America—as far south on the Pacific Coast as southern California—in Japan and central China, in Asia Minor, the Caucasus and Southern Africa, but is not found in the great northern region of southern Asia, to which it might naturally have extended. In western America it grows over an immense territory. At the north it is found in the valley of the Yukon River in latitude 62 degrees 45 minutes, and it extends south over nearly all the mountain ranges of western America, ranging eastward through the Saskatchewan Valley and Manitoba to the western shores of Lake Superior and to the northern peninsula of Michigan.

You have given us the Latin name and the botanical relations of this fruit, and I should like to tell you something about its relations, its usefulness to man and beast in the country where it grows. Like many of our cultivated fruit belonging to the same botanical group, the sarvis tree bears a plentiful crop only every alternate year. Besides that, sometimes a very dry spring or a late snap of severe cold will ruin the crop in a year, which, according to all calculation, should have been one of plenty. When either of these things happen, the animals that depend for food in part on the sarvis berries have to go hungry.

Many tribes of Indians collect these berries in great quantities, storing them in sacks woven from grass or from cedar bark, or in parfleches made of the skins of animals. When the berries are ripe the women go out in great parties to gather them, and spreading robes, blankets or sheets under the trees, beat the branches, and the ripe fruit, falling on the blankets below, is gathered up and afterward spread out to dry in the sun. In the winter the dried berries are boiled with dried meat or by themselves, and form an important part of the Indian's diet. In some tribes the berries are regarded as sacred, and must be used in all feasts which accompany religious ceremonial of any sort. These berries are delicious when fresh, but not nearly so good after they have been dried and stewed in the ordinary way. At the same time they have a distinctive flavor of their own, of which one becomes very fond.

I can remember nothing more delicious than fat buffalo ribs and dried sarvis berries, as eaten among Indians of the Northwestern plains, unless it be fat buffalo ribs and dried corn, as eaten among Indians of the South-eastern plains. But it must always be remembered that in

those times, and in those places, one had the appetite which goes with youth, hard work and an outdoor life.

For nearly a hundred years service berries have been a pretty important item in the food of the Hudson's Bay employees in the far Northwest, and when Captains Lewis and Clarke crossed the Rocky Mountains in 1803-1806 they were able on the waters of the upper Missouri to piece out their slender fare with the sarvis berries, which grew in great profusion along their route. The fruit is sweet and delicious, and many travelers throughout northwestern America have told of its usefulness. More than one party of explorers and prospectors have lived on service berries when all else failed them.

If the Indians eat plenty of sarvis berries, the bears eat a great many more, and all through the berry season they lounge about the patches of sarvis trees gorging themselves with the delicious fruit, and becoming fat and lazy. Sometimes a party of Indian women will find themselves gathering berries where a bear has been or still is, and when such a discovery is made there is a swift retreat by the women to safer quarters. The bears, of course, pull down the branches of the trees which they can reach to get at the berries, and the smaller black and brown bears climb the stouter trees. The larger bears, however, ride down the trees by their weight, resting the breast on the stem with one foreleg on either side, and in a grove of trees where berries have been abundant one may find many trees that have been bent down in this way.

Many of the smaller mammals also eat these berries; among them to some extent the coyote, and of course all the various rats, mice and squirrels—tree or ground dwelling—which are so abundant in the country where the sarvis berry grows. The birds feast on them too, robins, gray jays, Clark's crow, magpies, and a hundred others. On the whole, there is scarcely a plant that I can think of growing along the flanks of the mountain which furnishes food for so large and so varied a mammalian population as the sarvis berry. Yo.

The Service on Cape Ann.

Editor Forest and Stream:

Your correspondent H., in his article on the service berry, or *Amelanchier*, mentions a dwarf variety. He writes: "One dwarf form found on high lands is only 3 to 4 ft. in height, with quite small berries."

I do not know where H. gets his knowledge of a dwarf variety. I have before me the "Flora of Essex County, Massachusetts," by John Robinson. While treating the *Amelanchier* he remarks: "Tracy speaks of a curious variety at Norman's Woe, Gloucester, which fruits when only 3 ft. high."

This is the only book knowledge I am able to find in regard to a dwarf form. I have found on the hills around Gloucester a dwarf form which fruits when the plants are not over 8 in. in height. The fact is, the plants are all heights, from the tree down to the very lowest bushes. It seems to be the evolution of a dwarf from a standard variety. A few years ago I sent samples of the dwarf variety to Mr. John Robinson, who has charge of the Peabody Academy of Science, Salem, Mass. Mr. Robinson sent some of the plants to Cambridge for the Arboretum. Professor Sargent saw them, and wrote me for particulars. I understand that he expected to rearrange *Amelanchier* for the botanical works. If he did so it is unknown to me.

The fruit of the dwarf varieties is not materially different from that of the standard. Both the dwarf and standard varieties bear large and small berries.

The *Amelanchier* grows in great abundance in the swamps and on the hills of Cape Ann. The fruit on the hills is usually wormy or blighted, while in the swamps it is excellent.

I wrote up this shrub and sent the manuscript with a photograph of the plants in bloom to Garden and Forest several years ago. I enclosed postage, but the manuscript never returned, nor did I hear from it at the time or since. The publication has suspended I believe.

I will quote a few lines from my lost manuscript to explain the peculiar growth of the dwarf variety.

"It did not take me long to discover that I had several interesting problems to solve. Instead of two varieties, a dwarf and a standard, I found varieties all heights between the two. It was the evolution of a dwarf variety from a standard with no missing links. Another curious phase, the shrub in the process of evolution spread over a greater area. A standard variety consisted of several stems from one crown, while a variety a little below the standard sprung from a number of crowns and consequently occupied more ground. The extreme dwarf variety sprung from numerous crowns, which spread over not less than one square rod. The shrub showed one other peculiarity. The evolution of a dwarf variety had produced a marked change in the blooming season. The extreme dwarf variety was fully ten days later than the standard in flowering." HERMIT.

Replies to Mr. Mather's service berry question have been sent by Von W., of New Hampshire; E. H. A., of Connecticut; Nemo, of Pennsylvania, and others; and one correspondent writes that the berry is cultivated.

About Trees.

Editor Forest and Stream:

Friend Coahoma requests me to explain the growth of trees. I do not think there is much left for me to say after his excellent description of the growth of a tree.

There is no growth upward of the trunk of a tree for a very good reason, namely, the cells of the old wood do not redivide, therefore must stand where first formed.

There is an upward and outward growth to all trees, but it takes place at the extreme ends of branches by the division of cells. Cells divide when the material of which they are formed is mucilaginous. As growth progresses the lower cells become hard and woody and do not divide. The trunk of a tree can increase in growth in diameter, but not in height. It is a disputed question whether the roots of trees are able to raise the whole fabric. The cavities at the base of many trees are supposed to show that the roots have forced the trunk out of the ground. I do not think this is the fact. I believe the roots grow upward on the trunk just as the limbs do. If we bear in mind that all growth is by division of cells we cannot go wrong in our conclusions. HERMIT.

Podgers' Commentaries.

Editor Forest and Stream:

In reading over your number of Jan. 14, I was very much interested in the article by your valued correspondent, S. N. Rhoades, on the subject of skunks. It is not often we see any defense of that odoriferous animal; in fact, he has few friends, and after reading the article in question, in which the character of his skunkship appears in rather a better light, I am encouraged to say a few words in his favor myself, malodorous as the subject may be, and as surprising as it would probably be to him to find that he had at least two friends willing to give him credit for what virtues he may possess.

We will pass over a few little delinquencies that truth compels us to admit are not creditable to him, such as his epicurean taste for chickens; but the fox, the coon and the weasel have the same failing, so we will not lay that as an exclusive sin at his doors.

In my boyhood days we used to set slip-noose traps, a bent-down sapling supplying the elevating power, and when the villain was so suspended his odoriferous protests were telegraphed to the nearest neighbors "on the wings of the wind," and called forth sundry indignant remarks from old ladies whose sense of smell was still keen, such as "them ere pesky boys have got another skunk up in the orchard, drat 'em." No boy had the courage to bury the enemy with the honors of war, and the result was that the nearest neighbors had in self-defense to hire old Nigger Ned to do the job at the not extravagant fee of 10 cents and a drink of old whiskey three days from the still.

In subsequent days I have met casually with this dealer in "perfumes," but not on social terms; in fact, there has always been a distant coolness and a mutual agreement that no intimacy was desired, this resulting in each of us giving his undivided attention to his own business.

As to the question of his omitting the opportunity to express his parting compliments if bereft of vitality suddenly, my experience, though limited, does not bear out the statement. A friend and myself on one occasion were encamped at the outlet of Lake Edwards, Canada. We had given a whole day to the erection of a very swell affair, as we were intending a prolonged stay, and at great labor had cut and "toted" about a cord of wood; and after a trout supper and the ever-present pipe, we were glad to seek our cots.

About midnight I was awakened by a pat pat of light footsteps around the tent and an occasional scratching on the canvas. My friend was a sound sleeper and was snoring away oblivious to all such small noises until I awoke him, saying, "John, what the deuce is that scratching?" He yawned and finally pulled aside the curtain of the tent and looked out. It was bright moonlight; but seeing nothing, he turned in again. As soon as all was still the scratching was renewed. John sprang out of bed again, saying: "Dash my buttons if I don't stop that little game, whatever it is." And picking up the double-barrel he stepped outside. A few moments later, bang went one barrel of the gun. "Hello! what is it?" I asked. Before he could answer the atmosphere saved him the trouble. Great Scott! It came in chunks; you could cut it with a knife. It was simply overpowering—suffocating. No mortal man could stand it. Hastily donning our clothes, we broke for a position to windward, and wore the time out until morning sitting on a fallen log.

When daylight came we discussed the question of what was to be done. Should we make a united effort and bury the skunk? By stuffing our noses we succeeded in doing it. We forgot that the ground was saturated. No relief was had. It was as bad as ever, and the result was that we had to break camp and move over across the lake; and even then days elapsed before, with all our airing of the clothes and tent, we succeeded in getting rid of that most diabolical and lasting quality of the vile odor. Any perfume manufacturer that could give such staying qualities to his perfumery would make his fortune. It is said that a grain of musk will give forth its odor for a thousand years. I don't believe the author of the statement could make it from personal experience, but I will bet him that alongside of that little animal's manufacture musk would be nowhere.

A subsequent experience down in Texas was more favorable to the character of the amateur Lubin. Several of us were living in a cabin quite a distance from any other dwelling, when one evening, after dinner, as we sat smoking on the steps, one of these aroma dispensers made his appearance quite near us. One of the boys ran into the house for his gun. I intercepted him, saying: "Don't shoot the little cuss, or we can't live in the house." We went indoors and watched him. He snuffed around for a time, and I threw him a piece of bread, which he immediately ate; and then he retired under the house, where he seemed to have taken up his abode. How to get rid of him without his leaving his compliments was the question. We finally decided that the least of the two evils was not to molest him. The result was that he grew very tame and came up on the steps for his bread, and finally was so tame that he would take bread from the hand. He seemed to know the hour of meal time as well as we, and was always on hand.

We were particularly careful not to make any offensive demonstration calculated to irritate his sensitive nature, and our friendly relations continued for several months and until we left. The moral of it all is that it is policy for man to restrain his proclivities for the immediate destruction of that against which he has natural prejudices, until he has ascertained what good there may be in it. Any hasty action may result in waking up the wrong passenger.

As a general thing, I do not recommend this little animal as a household pet, despite my last experience of his amiability; for his tail might get accidentally trod on, when he would be likely to express his views in a very unpleasant manner; but I would advise that in case of accidental meeting a strictly armed neutrality should be preferred; for I do not think the dealer in perfumery would be the aggressor. We often meet with the counterpart of this specimen of natural history in beings with two legs. They are not infrequent, and we give them a wide berth. As the result of my experience, I give my preference as an associate to the species with four legs. They are the least offensive of the two varieties.

PODGERS.

Birds that Hunt and are Hunted.

AMONG the flood of bird books that have made their appearance within recent years, one of the most striking is that entitled "Birds that Hunt and are Hunted," published by the Doubleday and McClure Company. Under this broad title are included descriptions with brief life histories of about 170 birds of prey, game birds, wild-fowl and other water birds, the whole illustrated by many plates in colors, which first appeared in a Western magazine. There are nearly fifty of these plates of varying degrees of excellence, but many of them capital representations of the birds, and all are sufficiently close to nature in their colors to enable the reader without difficulty to identify the species. These are evidently photographs of stuffed birds; and in many cases they are poorly stuffed. But there are others which are so excellent that it would be hard to find a point at which they could be criticised.

"Birds that Hunt and are Hunted" is by Neltje Blanchan, the author of "Bird Neighbors," to which it is a companion volume. Beginning with the grebes and loons, it follows through the gulls, petrels, cormorants and ducks, the herons, ibises, storks, cranes, rails and their allies, the shore birds, gallinaceous game birds and pigeons, to and through the birds of prey, the whole book including more than 350 large pages. Each order of birds is characterized in general terms, the different species under it are named and described, and from one to half a dozen pages given to its life history.

The book is written from the same view point as its predecessor, "that of a bird lover who believes that personal friendly acquaintance with the live birds as distinguished from the technical study of the anatomy of dead ones must be general before the people will care enough about them to reinforce the law with unrestrained mercy. To really know the birds in their home life, how marvellously clever they are, and how positively dependent agriculture is upon their ministrations, cannot but increase our respect for them to such a point that willful injury becomes impossible."

This is surely a good point of view to have, and it must be said that the author succeeded in making interesting the birds written about. The style is pleasing and the facts on the whole accurate and taken from the best sources. Much space is given to the game birds, and of these the portraits are among the best in the book, though the frontispiece—the passenger pigeon—and the herons are also especially good. The figure of the prairie sharp-tailed grouse is rather notable for its excellence.

Of the bittern the author writes, "Come upon the hermit suddenly and it seems paralyzed by fright. When danger actually threatens, up go the long head feathers, leaving the neck bare and making the bird look formidable indeed. The plumage is ruffled, the wings are extended, and if the adversary comes too near a violent slap from the strong wing and a thrust from a very sharp beak makes him wish his zeal for bird lore had been tempered with discretion. A little water spaniel was actually stabbed to death as a result of its master's inquisitiveness."

"During the day the bittern, being extremely timid, keeps well hidden in the marshes, but it is not a nocturnal bird by any means, however it likes to migrate by night. To some it appears sluggish and indolent as it stands motionless for hours, but it is simply intelligently waiting for frogs, lizards, snakes, large winged insects, meadow mice, etc., to come within striking distance, when, quick as thought, the prey is transfixed. A slow meditative step also gives an impression of indolence, but the bittern is often only treading mollusks out of the mud with his toes."

"In the air the bittern still moves slowly and with a tropical languor laps its large broad wings, and trails its legs behind, to act as a rudder as it flies close above the tops of the sedges. When a longer journey than from one part of the marsh to another must be made, the solitary traveler mounts high by describing circles, and secure under the cover of darkness, makes bold and long excursions. It is only in the nesting season that we find these birds in couples. Then neither one is either far away from the rude grassy nest that holds from three to five pale olive buff eggs hidden among the sedges on the ground in a marsh. There are those who assert that young bitterns are good food."

We fancy that all who have ever eaten young bitterns, or old ones either, aver that they are good food, and in old times was not the bittern regarded as a game bird?

A few of the statements in the volume—such as the intimation that the black skimmer uses its bill to open mollusks—are hardly borne out by any observations known to us, and one curious reference to a bird standing on a "distended branch" is not very clear, but the book deserves high praise and should do good.

The "Osprey."

THE Osprey, well known to our ornithological readers, has changed hands, and moved from New York to Washington. It is now published by the Osprey Publishing Company, of that city, and is edited by Drs. Elliot Coues and Theo. Gill, with Mr. Walter Adams Johnson, the former editor, as associate editor, and Mr. L. A. Fuertes as art editor. An editorial in the October number—the first printed after its change of locality—says: "The Osprey being a migratory bird has flown southward from New York to Washington this autumn, and taken up its winter quarters in a new locality, of which it proposes to become a permanent resident. The moulting process has proven somewhat severe and protracted this season, and the appearance of the bird in its new plumes has consequently been delayed. We beg indulgence for any traces of pin feathering which may be discovered in this issue, feeling confident that the renewal of plumage will be perfected next month."

While this apology was required for the number in which it appeared, the succeeding issues—for November and December—are a great improvement, and indicate that only a little time is needed for the magazine to regain its old high standing of excellence as to typography and presswork. That the quality of the matter contained in it is good is guaranteed by the names on its editorial board.

Some Florida Birds.

Barn Owls or "White Owls."

Early in April of last year the captain of the steamer Roseada, plying on the Kissimmee River, reported the discovery of a white owl's nest, which was in a hole of a leaning dead cabbage palm, overhanging the river. Twice a week on his trip up and down he watched the growth of the birds, until he considered them old enough to move. He then transferred them from the nest to a box, under serious protests from the parent birds. The birds proved to be specimens of the barn owl, and great was the surprise to see the three owls of three different sizes and evidently considerable difference in their ages. From inquiry it is learned that these birds, after hatching the first egg, lay another, whose hatching is left to be done by the young bird while it feathers, thus explaining why the birds in the different stages of development were found in the same nest, and explaining too the responsibility that the oldest bird seemed to have over the younger ones—much as an older child watches over the younger ones of a family.

The oldest owl was almost matured—in full feather—its large black eyes, almost human in expression, being well set off by the snow white face. The plumage on the back was a golden brown, the rest of the body streaked with white. The second bird in size was an ashy dull white; he was covered with down—the down on his face giving him a vicious expression—entirely different from the oldest bird. The baby of the nest was scarcely half the size of the oldest bird, had a sharp, narrow and long face, with a weakened, monkey-like expression, but he was snow white, looking like a ball of wool. He cuddled under the larger birds, and at feeding time was the most ravenous eater of the crowd. All day long these three wise little owls quietly sat, making no sound except when approached, when a sharp snapping of their beaks announced that they wished no intruders. To turn them out of their box in daytime meant a quick return to it. They were turned out one day for a visitor to admire, and the box removed, when they quietly sought refuge under the folds of her dress skirt. At night they were in their element when turned loose; they walked around, flopped their wings, would come up and take food from the hand, and drink water from a spoon placed between their beaks with as much ease as a person possibly could. After eating to their satisfaction, they would return to the box, and there sit for an hour, peering out, swaying their bodies backward and forward, as if rocking themselves to sleep.

The pleasure and the study derived from observing these young owls scarcely compensated for the sorrow caused around the old palm tree. For several trips, as the Roseada passed up and down the river, the old owls followed the boat, darting at it and crying for the loss of their young, their mournful tones coming to the crew on the still nights like some haunting spirit.

FLORIDA.

More about Skunks.

I READ with much interest the article on the skunk. I have had just a bit of experience with skunks myself, beginning at the time when I was a very small youth, and mistook one of the playful little beasts for my pet kitten in the dusk of a summer evening, until at the present writing, when the aroma hangs thickly about the house owing to the efforts of an unsophisticated hired man to kill a skunk in the woodshed.

A short time since I had the good fortune to visit a skunk farm in this State, that promises to bring a good sum of money to the owner. No odor did I detect, and the little animals ran about the proprietor's feet like so many cats. Without any hesitation he would reach into an old box or barrel full of leaves or straw and drag forth some choice specimen to exhibit to me, while I stood near experiencing the sensations of a man smoking a cigar in a powder mill. He told me that skunks were a very easy crop to raise; only needed plenty of food, offal from nearby slaughter houses, and a few hollow logs, old barrels or boxes with plenty of straw for nests. Then his flock consisted of skunks of all the sorts of markings known to the tribe, but he was confident that he could, by careful breeding, produce only pure black animals.

In this locality the bite of the skunk is considered as poisonous as the bite of a snake. I know of only one instance that resulted seriously, and that was the case of a trapper in one of the nearby towns, who was bitten on one hand by a skunk he had captured in a trap. Although several remedies were tried, the injured member began to swell and caused him great pain, which continued for some weeks, and finally ceasing, and the wound healed. His hand is, however, badly crippled, as he has lost the use of two fingers. Local doctors called the trouble blood poisoning pure and simple, caused by a deposit of foul matter on the teeth of the animal and which was left in the wound when it was inflicted. As the skunk is fond of carrion and other decayed animal matter, the deposit that would naturally accumulate on the teeth would poison the wound that otherwise would be free from dangerous consequences.

Do skunks have any cry? Old trappers with whom I have talked aver that they have a peculiar whistle. But in my long acquaintance with the skunk I have always found him as dumb as an oyster and a creature to be smelled, not heard.

KENEWELL.

VERMONT.

The Seaboard Air Line.

Editor Forest and Stream:

Those who can be shareholders and receive the good dividends are to be congratulated, and it is of interest to outsiders to know there is such a line, heavily traveled and affording safe passage from "down East." Are there many that leave the line? On a steamer to Liverpool in September last, the second day at sea I saw a vireo, high-hole and sparrowhawk seeking rest about the ship and rigging; they were very tired; and I was told others had been seen. In their condition, life seemed likely to be very short. There was no storm to drive them from the line.

J. QUAY.

City-Bred Woods Birds.

COMMENTING ON Mr. Chas. Hallock's notes on this topic in our issue of Jan. 31, Mr. L. H. Smith, of Strathroy, Ont., writes to Mr. Hallock:

"I was very much interested reading your paper. This feature of our birds changing their habits according to surrounding circumstances is a very interesting study, and one which perhaps we who are lovers of birds and nature do not follow up as closely as we should.

"Do not some of our naturalists in their extreme denunciations of my little feathered brother countryman the English sparrow make a mistake when they accuse him of depopulating our towns and suburbs of our native birds? Poor Jack! I know he has sins; but he was the feathered companion of my childhood in the old country. What a triumph of Nimrodian ambition it was to outwit a cock sparrow! I am, so far as I know, about the only true friend he has on this continent. And my report to the Department of Agriculture, Washington, some years ago was the only favorable one out of hundreds that were sent in.

"My practical study for many years of our birds has led me to believe that they change their habits if the surrounding circumstances are such that it is well for them to do so. The purple martin was not a city bird before there were any cities; it is now. The grackle is common on my lawn; forty years ago he was never seen there. The oriole swings his pendent nest in an elm at my front door, and chippy is in partnership with the English sparrow as scavengers at my back doorstep.

"That noisy rascal the bluejay in that 'baseball suit' of his screams defiance at all the vocal powers of the other inhabitants of my orchard. A saucy yet lovable rascal.

"All our native birds are about my town in summer as they always used to be, and the Baltimore oriole is more so. The grackle has taken up town life during the last five years. The little bluebird is scarcer than in years gone by. Not driven away though by the 'pestiferous' English sparrow, but by the decimation he suffered a few years ago from severe weather. He is gaining steadily, and I hope to live to see him as plentiful as he ever was. He is such a gentle little fellow. I can no more imagine spring in our northern country without the bluebird than I can summer without the swallow.

"I am always pleased to see anything from your pen."

Crow Roosts.

KANSAS, Jan. 28.—*Editor Forest and Stream:* I notice a request from Mr. W. Stone in one of your late papers for information about crow roosts. From Pennsylvania to Kansas is a long way, but the Kansas crow must be represented.

There is an enormous crow roost on the farm of Leonard King on North Big Creek in Liberty township, near Burlington, Kansas. Two or three thousand hang around the roost from about 2 o'clock in the afternoon till dark; and at about sundown the main body comes in in countless numbers and fills the trees for acres. Early in the morning they scatter in all directions very quietly, and I am satisfied that some of them go twenty miles or more to feed, although many remain in the vicinity all day. Mr. King says that the roost has been one of the features of his farm for a good many years.

W. J. DIXON.

Editor Forest and Stream:

Mr. Witmar Stone wished for information regarding crow roosts. Five years ago last autumn I noticed a large gathering of crows in a grove of hemlock and pine on a mountain in an adjoining town a few miles from where I reside. Every afternoon at about 3 o'clock members of the band could be seen winging their way to the grove from every direction, and the place was a perfect bedlam until the last straggler arrived. Early in the morning the band, without a sound, would leave for their feeding grounds, to return again as night approached. Every year the "crow camp meeting," as the neighbors call the gathering, goes in session about Sept. 1 and continues until cold weather forces the crows to start on their southward flight. On the day of their departure the noise of the company is kept up unceasingly until early in the afternoon, when in scattered bands of a dozen or more individuals they set forth on their journey, and by evening the last crow has left the grove. I should say that somewhere from 500 to 800 crows gather in the grove each fall.

S. O. BRUSH.

2 MILFORD, Vermont.

Monkey, Man and Hog.

ST. LOUIS, Mo., Feb. 3.—*Editor Forest and Stream:* An old hunter once told me that there are only two large mammals whose eyes will not shine by reflected light, namely, man and hog.

Now, is this true? And if it be true, what are we to infer? The naturalists tell us that we are descended from monkeys, because we have rudimentary tails, which show that, ages past, we had bona fide tails and used them. This evidence is considered sufficiently conclusive without even a fossil connecting link.

But the non-shining quality of the human eye is not a mere survival of some function long since played out. We have it still in prime working order, if a negative quality can be said to work. And we share this attribute, they say, with only one mammal in all creation—the hog!

I have often suspected a certain kinship in nature as regarded certain individuals, and this kinship crops out most noticeably in camp life. Doubtless you have observed similar relationships and have thought thoughts about them more or less audibly; for instance, on a very cold morning, when it was the other fellow's turn to crawl out and rustle for a breakfast, and you couldn't rouse him with a pair of boots.

But the annoying thing about this non-shining business is that it seems to be a universal attribute of pigs and humanity, and of nothing else. Cannot some of your readers discover another mammal whose eyes won't shine from a jack-light—no trifling mole, but some fairly decent animal, to which we could cousin-up without total

loss of self-respect? It is comforting, sometimes, to believe in the Darwinian theory as applied to other people. You can say that So-and-So is reverting back to the monkey type, while you, of course, have been cleansed from such relationship by æons of respectability. But to confess that you and your own bunkie are still first cousins, if not own brothers, to so repulsive a creature as—don't mention it—can we not rid ourselves of this embarrassment before the naturalists get wind of the item? They would simply revel in it.

HORACE KEPHART.

Caribou Heads.

SCRANTON, Pa., Feb. 3.—*Editor Forest and Stream:* Your illustration of Mr. Chas. F. Riardon's thirty-nine point caribou is excellent and the head undoubtedly a good one. In referring to my diary, as it was kept while hunting on the White Hills of Newfoundland during the fall of 1897, I find the record of a fifty-four point caribou brought into camp by Mr. E. G. Asmus on Sept. 19 of that year. This great head, in company with nine others ranging as to points from 25 to 54, are now occupying places in private houses, and the largest may be seen in the home of Mr. E. G. Asmus, of West Hoboken, N. J. I consider this to be the finest head in the United States. Can any one report anything better?

A. B. BLAIR.

Stray Carrier Pigeon.

MR. LEONARD HULIT writes that a chocolate and white homing pigeon is held by Mr. H. A. Sieghertner, of Asbury Park, N. J., awaiting owner's claim. When first seen the bird was being pursued by a pigeon hawk, and darted behind a window screen to evade its enemy. It has a gold leg band bearing No. 246, date 1895.

Game Bag and Gun.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in *FOREST AND STREAM*.

March 2-15.—National Sportsmen's Association Exposition, New York.

The Megantic Dinner.

THE annual dinner of the Megantic Fish and Game Corporation is an event which receives a wealth of anticipation from scores of New England sportsmen. The experience of years gone by has taught them the real merit of these occasions in the line of genial companionship, and the extension of plans for that which every sportsman holds close to his heart, namely, the successful propagation and better protection of game and fish. As the years have rolled away these events have come to be looked upon as a time of general reconciliation among those who hold different opinions as to the best policy to pursue for the cause, and it has become quite the fashion to clear away all misunderstandings as to what should be the open and close time on game and fish, and to close the ranks for united effort. The Brunswick Hotel, in Boston, was the place, and Saturday evening, Feb. 4, the time selected for the Megantic's twelfth annual. I have had the good fortune to attend these dinners without a break for the last nine years, but have never met so many notable sportsmen or witnessed so much enthusiasm as at this event. The magnificent banquet hall was handsomely decorated with moose, deer and caribou heads, bear and fox skins, and birds. Daggett's orchestra and Bob Hyde's colored troubadours kept the room ringing with good music, and the members and guests found time to join in with all the popular songs and negro ballads. The chief speakers of the evening were Caspar Whitney, of New York; La Fayette G. Blair, of Boston, and the Hon. L. T. Carleton, chairman of the Maine Fish and Game Commission, and Mr. Myron Whitney sang the parody on the "Three Fishers."

Mr. W. A. McLeod, president, reported that the club membership of 300 was complete, and spoke enthusiastically of the fine condition of the club house, camps, boats and trails. Robert Phillips, as superintendent, and Mr. Durell, as steward, have been re-engaged, and the supplies for the coming season are all ready in place. Owing to the advance in price on lumber a large timber tract owned by the club had become very valuable, and financially speaking the club is in a position to pay its entire indebtedness, including bonds, and will then have a few hundred dollars to spare. Members occasionally wander away to other parts of Maine, but always return to better appreciate the comforts and good qualities of the club preserve. Mr. McLeod spoke of the antagonism the club had met with years ago, and how it had happily all passed away, and closed his remarks with an eloquent tribute to the management of the late war, which was sufficient to bring the company to its feet in a frantic burst of cheers for the Nation's President.

Mr. Caspar Whitney held the close attention of all present by his interesting story of musk-ox and caribou hunting in the great Northwest barren grounds.

An air of expectancy pervaded the hall regarding the presence of Chairman Carleton, of the Maine Commission. There has been a lot of newspaper talk about the radical changes which the Commission proposed to recommend to the Maine Legislature regarding game and fish laws, and all present were anxious to learn the facts. Mr. Carleton spoke as follows: "I am pleased to see the zeal exhibited by Megantic Club members to protect their game. The people of my State are no longer suspicious of you, and are glad to welcome you at all times. You have set a good example for the rest of the State. The Maine Fish and Game Commission are not responsible for all petitions and bills introduced about fish and game. The Commission has not yet introduced a single bill. Next week, however, we will introduce a bill which will become a law. This bill has the approval of the Maine State Fish and Game Association. It is proposed to give the courts discretion regarding the violation of the moose law, making penalty a fine or im-

prisonment, instead of imprisonment only. Other changes are a six years' close time on caribou, which are fast disappearing. Regarding deer, we propose to change the open season from Oct. 1 to Dec. 15, instead of Jan. 1, as now. In eight counties of the State it is proposed to give permission to take one deer for food purposes during the month of September, on the payment of a \$6 fee by non-residents and \$4 by natives. There has been much criticism about this act, but the Commission is satisfied that it is for the best interest of all concerned. The chief reason for it is our want of funds, and we believe that no more deer will be killed than now. Many of the September camping parties have Winchester rifles for fishing rods, and the slaughter has been large. Our best guides favor the measure, and will see that it is not abused. Thirteen thousand deer were killed last year, and yet there were never so many of the animals as now. We also propose that visiting sportsmen shall be allowed to send home a limited amount of game and fish by paying a nominal sum for a shipping tag, thereby not being compelled to accompany it, as now. We want your support in these matters, which I assure you have been carefully thought out for the very best interests of the State."

Mr. Carleton was very eloquent and received a hearty round of applause.

Mr. L. G. Blair was the last speaker of the evening, and at midnight the twelfth annual banquet of the Megantic Club had gone to join its fellows of the past.

W. R. SCOTT.

Adirondack Hounding.

Editor Forest and Stream:

You published a letter in October last, in which I lamented the sentiment in favor of hounding, which is not losing ground to any appreciable extent among the hotel keepers and guides of the Adirondacks. Adirondack papers have printed the article, with comments to the effect that I didn't know what I was talking about. I wish I had been wrong, and that the guides and hotel keepers were more alive to their own interests than I gave them credit for being.

The Adirondack Guides' Association cheerfully passed a resolution in favor of thirty days of hounding the other day, and State Senator Chahoon, who is on the Senate Committee of Game and Fish, pops up serenely with a bill advocating hounding for a few days—thirty odd. Just enough, that is, to make the breeding of hounds and training them in the deep snow of winter a business worth the while of some of these same guides. In the played-out districts about the Saranac and Fulton Chain of lakes the hotel keepers want hounding allowed, so that their guests won't have to go so far after game. Elsewhere the hunters could get along without the dogs.

If I were not so entirely selfish in the matter, I should say, let them float for deer from July to September, and thereafter allow hounding so long as a paying customer could be found to stay on the runways. A month for the training of dogs during deep snow time would be convenient, but not necessary. But I wish to go to the Adirondacks still-hunting for deer once in a while, and I would find it as difficult to advocate so wide open a policy as I would to advocate any length of hounding season, no matter how brief, for the simple reason that a day's hounding invites wholesale violations to keep the hounds hard and in training.

I wrote to the Senate Committee, of which Hon. Mr. Chahoon is chairman, about the deer matter. The Hon. Elton R. Brown, of the Thirty-fifth District, replied:

"ALBANY, N. Y., Feb. 1.—Mr. Raymond S. Spears, Esq., New York City. Dear Sir: I think the Senate Committee will agree with you on the deer question. I am wholly of your opinion. Very truly yours,
"ELTON R. BROWN."

That makes things look better. Nevertheless, the guides and hotel keepers have my compliments. In their way they stand unrivaled. But this must not be construed to mean the woodsmen proper—the farmers, storekeepers, blacksmiths and the run of men who go hunting, not to make a living, but to enjoy themselves. The real woodsmen are seldom heard from in the press, but they outnumber the guides three to one, and in northern Herkimer county I believe four-fifths of the genuine woodsmen favor the present law of non-hounding.

RAYMOND S. SPEARS.

NEW YORK CITY, Feb. 4.

Boston and Maine.

BOSTON, Feb. 4.—Messrs. Bradley, Mann and Steadman are back from Mr. Bradley's hunting preserve at Stono, S. C. Quail were very plenty, and all wanted were taken. Duck and snipe shooting was also fairly good. They shot deer as soon as they were wanted, and kept the table supplied with venison. But the most exciting hunting was that of wild boar; a good many of these animals are still to be found in that part of the South; they are fierce, and even dangerous to hunt, and have to be followed through interminable thickets, swamps and briar patches.

It is pleasing to be able to state that the hunter's license measure was virtually killed before the Committee on Fisheries and Game in the Maine Legislature on Wednesday, the vote of the committee being to refer the measure to the next Legislature, that body not convening again till 1901. The proposition to leave the enforcement of the game laws to the county attorneys and sheriffs was also killed before the same committee, by a vote that it is "inexpedient to legislate" on such a matter. This effectually disposes of these two propositions, unless the schemers introduce bills of the same nature in either house, which they threaten to do. There still remains the proposition to allow hunters to shoot deer in September, for food purposes, by paying \$6 a head for the privilege. But it is very certain that this measure also will meet with something of the same fate as the others, though Commissioner Carleton has advocated it. The feeling now is that the game and fish laws of Maine are better left about as they are, with the possible exception that it would be well to open the last half of September to the hunting of deer, and to take off the open season the last fifteen days of December. Boston sportsmen are pretty generally in favor of the shorten-

ing of the open season on deer the last part of December, as it is certain that the snows are often deep at that time, and that it is then that the snowshoe and crust hunters often get in some of their worst work. The opening of the last half of September would give law-abiding sportsmen a chance to combine a little fishing with shooting in that State.

Feb. 6.—The annual dinner of the Megantic Fish and Game Association, Saturday evening, was a pronounced success. Two hundred men assembled at Hotel Brunswick, and everything was cheerful and bright from start to finish. The speaking was done chiefly by President W. A. McLeod, L. T. Carleton, chairman of the Maine Fish and Game Commission, and Mr. Caspar Whitney. Mr. Carleton, who is greatly in earnest about the future of big game in Maine, spoke somewhat in defense of the reforms he has urged in the Maine code of game laws, claiming that these reforms must come sooner or later, though probably laid on the shelf for the present session of the Legislature. Though defeated in his efforts this time, he will continue to labor none the less earnestly for the good of big game in Maine, and hence for the good of sportsmen in general. His remarks were greeted with applause. He created a very favorable impression, and several prominent sportsmen were heard to agree that they should like to follow in line with a fish and game protector—one who has done so much already, one who has the good of the cause so much at heart—were he advocating anything less obnoxious and hurtful than any system of licensing hunters. Mr. Carleton seems to earnestly believe that the only way to raise the much-needed funds to pay for big game protection is through some sort of special tax on hunters. Failing in this matter, he is for most careful and conservative legislation.

SPECIAL.

Game Interests around Rochester.

ROCHESTER, N. Y., Feb. 4.—*Editor Forest and Stream:* The Monroe Sportsmen's Association, which was organized in the winter of 1890-91 for the purpose of stocking the woods and waters of Monroe and adjoining counties with game and fish, took action to-day that is probably unprecedented in the history of such societies. Owing to the decrease of many of the leading spirits in its organization, the Association has not been active for several years, and it is questionable if it would ever again have held a meeting had it not been for the discovery that the sum of \$270 was deposited to its credit in a savings bank by the late Frank B. Bishop, as treasurer. The surviving members thought that the money might as well be appropriated toward the purposes of the club, and a meeting was held to-day at the office of Vice-President Fanning, where it was duly determined to draw the funds and divide them evenly between the Mitchell Preserve Association and the Genesee Valley Fish and Bird Protective and Propagating Association.

The following resolutions were unanimously adopted:

Resolved, That this Association regrets the action taken by the Board of Supervisors of Monroe county in calling for the repeal of the State law that prohibits fishing with nets within a mile of shore in Lake Ontario.

Resolved, That the good effect of the present law in protecting spawning grounds is so apparent to us as anglers that we would regard its repeal as disastrous to the great question of restocking Lake Ontario with food fish.

Resolved, That the secretary furnish a copy of these resolutions to each Member of Assembly from Monroe county.

It is understood that the associations above named that are to disburse the windfall will bring in quail and other birds to be liberated in this vicinity.

The Mitchell Preserve Association has several thousand acres of good ground under lease, and if it can keep market shooters out of its covers, ought to make a satisfactory showing. I am in hope that they will lay out some of the money to stock their fields with pinnated grouse, for the prairie chicken ought to have a chance in his native land. With his experience in wintering Western blizzards, the bird would be in no great danger from the cold, and he might escape other enemies long enough to become acclimated and perhaps secure a permanent footing in western New York. The experiment would be interesting and not expensive.

E. REDMOND.

The Lacey Game Bill.

PHILADELPHIA, Pa.—*Editor Forest and Stream:* I read with much interest Mr. W. G. Van Name's earnest and courteous communication on the Lacey bill in FOREST AND STREAM of Feb. 4.

There are some points which I presented in the previous letter to which he refers, which I think he passes over with less consideration than they deserve.

For the sake of the argument let us assume that the Lacey bill is passed, and that the Government is ready to go on with its beneficent work in "the propagation, distribution, transportation, introduction and restoration of game birds and other wild birds useful to man." These are "wild birds."

Now, will Mr. Van Name be so good as to state where the commission is to obtain the necessary wild birds? Nothing but an absolute, practical explanation on this point will serve the purpose, for if the advocates of the bill do not know where the supply is to come from, who then does know? If Mr. Van Name or anyone else can give this question a definite answer, I will freely admit I am in error, inasmuch as I do not think that a supply is possible, and if there is no stock to draw upon, the commission in this respect must be therefore inoperative and a failure.

The State rights in the matter of its own domestic affairs are supreme. This was settled absolutely in respect to the Connecticut case, passed upon by the Supreme Court, and frequently referred to as authoritative and conclusive on this point. Without the permission of a State, Congress could not turn loose any birds in its covers, nor could it take wild birds out of a State which had a law prohibiting such taking. In short, Congress could not propagate, distribute, introduce nor restore game birds in any State without the permission of such State.

The interstate commerce law, to which Mr. Van Name refers, is not applicable to the case in question, since it only applies to commerce between the States, a distinctly

different matter from the ownership and sovereign control of the game birds within its limits.

If Mr. Van Name will explain how the game birds are to be obtained, it will be next in order to consider what to do with them, but without the game birds all other considerations are idle in this connection.

L. A. CHILDRESS.

CHICAGO AND THE WEST.

Way Down in Egypt Land.

CHICAGO, Ill., Feb. 4.—A personal letter from State Game Warden Harry Loveday reaches me from Kenton, Ill., which I take to be in that part of the State known as Egypt. Mr. Loveday is trying to see what he can do in the way of leading sportsmen out of bondage in that country. Evidently he is making trouble for the market-hunters, and he deserves the well wishing of all the decent sportsmen in the country. He writes:

"I have commenced suit in fifty-six cases in this county for violations of the game law. The class I find here are the worst of all, trappers and shippers to St. Louis market. Some 2,232 birds are represented in these cases. You can have an idea of how these rascals are exterminating the game when you know that this number of birds were in transit in two days! Every package of butter and eggs from the town of Parrish in those two days turned out to be quail and rabbits. This county escaped last year for the reason that I did not have time to attend to it myself, and the cases left in the hands of the State's attorney were not prosecuted. I have just got through with Washington county. Only five cases, four are convicted, but one got away and went out of the State."

Inquiries.

A gentleman at Caldwell, Kans., asks me for the address of some persons who are selling thoroughbred stag hounds. I must refer him to the advertising columns of FOREST AND STREAM.

A gentleman of St. Paul, Minn., asks for the addresses of reliable Chicago firms who sell nets and seines. Once more I must refer him to the advertising columns of the paper.

Mr. John J. Huddart, of Denver, Colo., writes: "Can you inform me where I can purchase some smartweed seed for sowing around the edges of our lakes for duck feed?" I would refer Mr. Huddart to that thoroughgoing sportsman, Mr. W. A. Wheatley, of Memphis, Tenn., who has been prominent in stocking the famous Wapanoca preserve. I think Mr. Wheatley can give him the information.

New Illinois Laws.

The usual grist of new game law bills is now on hand at the Illinois Legislature. There is no so-called sportsman's measure this year as yet so far as I am able to learn, but Warden Loveday has introduced a bill framed on lines which he thinks will be desirable. A salary for the State warden and a shooting license to raise protective funds seem to be conspicuous features. No bill is passed until it is signed. According to Warden Loveday, nothing can be done to stop the cold storage of game. Comment is idle at this stage of operations, but I must sadly admit that it seems useless to hope that Illinois will stop spring shooting or stop the storage of game, or come into line with the main features of the bill adopted at the Interstate Wardens' convention, to which excellent measure attention has been so frequently called heretofore.

The "Plank" in Tennessee.

Mr. W. R. Sims, of Memphis, Tenn., writes me that he hopes during the present session of his State Legislature to get a bill passed stopping the sale of game in his county, and in the whole State if possible. He says: "In this way you strike at the very root of the evil." There is no doubt of the truth of this last statement, but Mr. Sims is in error in thinking that we have such a law in Illinois. If he will write to Mr. C. E. Whelan, Madison, Wis., the latter will send him a copy of the interstate bill, which may be of benefit.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

North Carolina Game.

HAMILTON, N. C., Feb. 4.—I left the village a few afternoons ago after 3 o'clock and found six coveys before 6 o'clock P. M. I bagged ten birds. Two were very large coveys, one the largest I ever saw. All were within two miles of the village.

OLD LEGGINGS.

Mr. J. L. Kearney sends us a copy of the New Berne, N. C., Journal, which reports: "The present season has been a splendid one for sportsmen in this section of North Carolina. Bears have been plentiful, and it is estimated at least fifty carcasses have been brought to this city, besides a number of hides taken from these animals. Deer have also been shot very frequently, while the feathered tribe have furnished plenty of the finest shooting. A few days ago two hunters brought in 105 partridges besides other birds in a hunt of less than two days."

The Sportsmen's Show.

NEW YORK, Jan. 31.—*Editor Forest and Stream:* We take pleasure in advising you that the Sportsmen's Show, under the auspices of the National Sportsmen's Association, has been extended three days, making the dates March 2 to 15, Sunday excepted, at Madison Square Garden, New York.

The programme of the water carnival to be given in connection with the exposition is now ready, and will be sent on application by Secretary J. A. H. Dressel, 280 Broadway, Room 184, New York.

SPORTSMEN'S ASSOCIATION.

New Hampshire.

THE Bartlett bill to establish a new game and fish code for New Hampshire failed to pass the House. The feature of the measure was to make the landowner the sole possessor of the game.

The Hip Rest and Quail Weights.

JACKSONVILLE, Fla., Jan. 30.—*Editor Forest and Stream:* I saw a lot of stuff in the Times-Union the other day about quail, and among other things was this: "We of the South wonder why our tourists do not adopt the habit of shooting from the hip. For work with quail it is far superior, and after a little practice comes as naturally and far more easily than the shoulder shot." All of which may do for the marines; but a cart load of Southern testimony could not convince me that any good shot ever used his gun in such an unsportsmanlike manner.

I have shot with nearly as many men as Fred Mather has fished with, and I have never met with more than one instance of a bird being killed in that way. When in my teens I was out with some other chaps, and an unfortunate woodcock got up before one of them and frightened him so badly that his gun "went off half-cocked," and to his utter surprise the bird fell dead. His gun just happened to be pointed in that direction; but he did not recommend the others to adopt that style.

Another writer. I think in FOREST AND STREAM, says the Virginia quail are the largest in this country, and here is another case where a very large amount of very strong proof would be required to convince me. I have weighed two or three cock quail here in Florida, and they were exactly 50z. I have shot a great many New Jersey and Long Island quail, and my belief is that they weigh about 80z. I know that one of them was a breakfast for me, while two of them will hardly do the business here.

Will some of your correspondents through the country be good enough to go into the quail weighing business and settle this matter. I can't see why the birds in Virginia should be larger than anywhere else in the South, and I can't see why a man should hold his gun on his hip to shoot unless he is too lazy to raise it to its proper place at his shoulder. DIDYMS.

Ring-Necked Pheasants.

MR. EUGENE TERRY, of Tompkins county, N. Y., says of his experience in raising ring-necked pheasants:

"I have raised these birds at my place for two summers. They will not become broody in confinement, but are prolific layers, one of my hens during the months of May, June and early July of last year laying more than fifty eggs, most of which proved fertile. I set these eggs under bantam hens, and the period of incubation is about twenty-four days. One of the peculiarities of these birds is, that while they are apparently content in captivity, yet turn them loose and they become wild in a single day.

"This, however, is a feature which makes them doubly valuable as game birds. They are never found in a heavily timbered country, but like a locality that is partly cleared and partly wooded; so it will be seen that the surroundings here are well adapted to introduce them successfully. They never tree when being pursued, and fly very strong and alight with their feet moving. Thus it will be seen that they are abundantly able to take care of themselves with the pot-hunter."

The Currituck Ducking.

WATER LILY, N. C., Feb. 1.—*Editor Forest and Stream:* The shooting at Currituck this season has been better than for many seasons past, and to-day the Sound is filled with canvasbacks and redheads. The food has been abundant and of the right kind, owing to our having had no salt water running over the beach in the fall.

There is a bill before the Legislature now for a sunrise law. That means that no one will be allowed to leave the landing until the sun rises, nor to shoot after the sun goes down. With such a law I think we may expect good shooting for many years to come. We now shoot only four days in the week, Monday, Tuesday, Thursday and Friday. As a positive proof that rest days are of the greatest importance, on Monday and Thursday we kill more than twice as many fowl as on Tuesday and Friday.

We are heartily in sympathy with the laws protecting song birds, and I shall do all in my power to get such a law for North Carolina. Quail have been unusually abundant along the seaboard, and even now one can make a very good bag. MORE ANON.

Jackson's Hole Game.

JACKSON, Wyo., Jan. 23.—*Editor Forest and Stream.* I am pleased to report to you that 8,000 elk and an increase in the number of deer are now wintering on Little Gros Sante Hills; some 400 head of mountain sheep, mostly ewes and lambs, are wintering on the Big Gros Sante. The winter is mild and open and there is no danger of loss to the game.

You will note that very few elk came out of the park this winter.

The people of this locality meet in mass Thursday next to discuss park extension. W. L. SIMPSON.

DR. S. T. DAVIS, of Pennsylvania, in a trip to the Jackson's Hole country of Wyoming last season, secured "four bull elk, one blacktail buck, one cinnamon bear, one black bear, two antelope, and one very large mountain lion, besides small game and fish. This was my second visit to the Hole, and we found game very plentiful."

Spring Shooting—Sale of Game.

WATERTOWN, N. Y.—*Editor Forest and Stream:* Write your Assemblyman, your Senator, and the Governor; bury them with postal cards and letters; let them know you want these things stopped. The other fellows are working the men who only see the dollar, the market shooter and the game dealer. Write every week during the session. If every sportsman in the State of New York will do this, our representatives in the Legislature will not dare refuse us. W. H. TALLETT.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

Sea and River Fishing.

Proprietors of fishing and hunting resorts will find it profitable to advertise them in FOREST AND STREAM.

Fishing Up and Down the Potomac.

A LITTLE south of Arsenal Point, Washington, where the Eastern Branch joins the Potomac, and on the opposite side of the river, is the long and wide embouchure of Four-Mile Run.

The outer lip on the north is Robb's Point, on the south, Daingerfield's, nearly two miles away, and a line drawn between the two marks the boundary of the District waters; inside is Virginia.

Easy of access, by boat, or steam, or electricity, and at high tide a beautiful sheet of water, it has been popular as a fishing resort at least ever since there was a Washington; maybe long before. As with all streams which empty into the Potomac, its mouth is growing shallow, and at very low tide, when the grass and moss in the late summer are well up, it is difficult to get a boat over the mud out to deep water.

Formerly, when the water was deeper, the grasses less rank, and the rockfish more plenty, it was a noted place for their capture. One of Washington's original fly fishermen, Coalgate, left frequent marginal notes in his angling books of records which he made there. To-day they are seldom taken, except the small ones which swarm with the perch at times in the shadows beneath the great arches of the railroad bridge, over which once towered the aqueduct of the canal to Alexandria. When the canal was abandoned the aqueduct was blown up with dynamite to make room for a double track for the railroad, which suffered many disastrous wrecks here in its early history.

But if the rockfish are no more, there are still plenty of other fish, in spite of mud and weeds and nets. Nets are set and dragged here almost the year round, and there are always two or three house-boats to be seen at anchor in the cove, or high and dry on the gravelly beach. The Virginia line runs from point to point of the headlands, and so the cove itself is outside the jurisdiction of the District. Fyke nets are set all about the cove, and on summer nights they are not always confined to Virginia waters. Seines are being dragged now, not only on the shores of the cove, but opposite in the mouth of the Eastern Branch, and it is said 2,500lbs. of black bass, some above 5lbs., and some, alas! hardly so many ounces, have been sold in the markets of Washington in the past month.

All through the early spring, to late summer, a boat drags a miniature trawl net around the edges of these and the neighboring shores for crayfish, to be sold in the Washington market for 90 cents to \$1.50 a hundred, to be used partly for soups and partly to eke out lobster and shrimp salads; and there is no estimating the damage such a machine does in destroying the spawn beds of the sunfish, the bass and the perches. The latter we can not locate, but we know of whole colonies of the former, whose pretty bowls of washed gravel, over which they keep such jealous ward, were stirred and broken by this engine of destruction, and which the fish deserted. They should be as rigorously regulated as to close season as any other net, if the fish are to be saved.

The fyke nets used take mostly small fish, and in most of them the mesh is ridiculously close. When regulating legislation was first directed against the shrinking of the mesh, a 2in. mesh was intended to mean between the knots, but was speedily interpreted to signify its length when stretched, which brought an inch mesh within the license of a 2in. law.

During a freshet last spring some of these fyke nets were torn loose, and three were found on a neighboring beach; these the writer measured, and found the meshes of the pockets, and of part of the wings, only 1½in. diagonally across the mesh when stretched, or little more than ½in. square, or between the knots. This is close enough to hold anything above the size of a minnow, and setting one for an experiment to demonstrate what they would catch, several thousand yearling sunfish were taken at a single tide, which could be of no possible use save as fertilizer, and not worth the trouble of taking from the net for that. Ours were carefully removed and given a good home in a pool, which it was desired to stock.

These nets are hidden under water and inspected at night. There seems no way to secure efficient regulation save by increasing the police fund and amending the laws, with greater restrictions, neither of which events is probable. License might accomplish something. Registry and accountability will shut out poachers, for each regular will then join the authorities, and none so good to watch a net as a netter.

The middle ground of the bay, or swash channel, has many of the long-eared sunfish, but they are hard to locate in deep water. They affect colonies, and even when once found it is hard to recognize the exact spot again at a different stage of the tide.

At Robb's Point, on the north side of the cove, the grassy spit at low tide, with northerly or westerly winds, is a famous spot for white perch, and when the May fly is up one may anchor in the grass, and casting out with a white miller, or any light fly, tied to No. 12 hook, take perch till nearly midnight.

The north shore of the bay for half its length inward is well filled with the sunperch, and in the earlier spring, when the water is clear, their spawn beds may be distinctly seen dotted all about with the parent fish, like savage little torpedo boats, hovering over, ready to ram any intruder, from a fly to a carp.

They stay in the same neighborhood, apparently, throughout the year, and will take the fly till well after dark; with sunlight, scarlet ibis to a 12 hook has proved the best killer in our experience, though any color we have tried will take same, if the tackle is light enough. With a 2½oz. to a 4½oz. rod, and hooks 12 to 14 of almost any color, though blue is the worst, will get many a pleasant hour here in the early dusk. The Parmachenee Belle, or Miller, will take them a little better than even the Ibis as dark approaches, but as a rule they quit when the black settles down, just as the perch are getting most

lively. Occasionally a sunfish will take a fly, and sometimes even a minnow, as late as 11 o'clock, but any after dark are usually reckoned as accidental. But in the earlier part of the evening a hundred to the rod is not an uncommon catch for an evening, and doubles are frequently made.

They are vicious as any game fish, both at the snap and after; if they were heavier and retained their characteristics the bass and trout would need look to their laurels as sport promoters. Their broad side and strong fins give them the effect with light tackle of weighing twice their ounces, and one can no more stop their first rush with a 2½oz. rod than he can that of a tarpon with a billiard cue. And when they come to be eaten, they hold their own with any panfish in the opinion of many ichthyophagists. Twenty odd years ago, Maurice Thompson, writing of the sport of angling for small fish, said: "The killing of goggle-eyes and sun-perch is an art worth some pains to acquire. No 'slouch' can ever succeed in bringing one of these little fellows to land in good style. * * * When once you have properly begun fishing for panfish you are sure to get enthusiastically fond of the sport. It will grow on you day by day, till every other piscatorial pastime is crowded out of your mind. The babble of perch brooks will follow you to your business and enliven the tedious dryness of office labor, and the singing of the wind in the leaves of the great plane trees will stay in your ears for days and days after you have put by your rod for the season."

The man who has hunted and can still hunt large game may affect to consider quail shooting trivial sport, yet it will continue to afford delight to many men who can get no better, and who indeed desire no better. So to one who is fortunate enough to be able to reach salmon, or tarpon, or seabass the taking of sunfish of 4 or 50z. seems a puerile sport, and yet that man is to be envied who has learned to love the little fishes.

The summer sun is hot. The tar is bubbling from between the Beligan blocks and the asphalt sinks like warmed wax under your heel. The city walls shut out the feeble breeze, and even the English sparrows are panting in the shade of the bushes and have lost their pert and cheery chirp. Work is over, but there is no comfort inside the walls; no comfort in walking the hot pavements; no comfort in riding till dewfall in the crowded cars.

But thirteen minutes away is a little skiff and open water, and a good spring, and shade, if you want it, with real damp ground and genuine moss; and if the temperature is not quite frigid, you can breathe, and few are the evenings indeed when the breezes don't blow; and the track of the steamers is a mile away on the Maryland shore, and at the most you only catch their lazy swell long after they are out of sight, or hear the excursion bands, softened by the distance into sweetness; and you get the transformation scenes of gorgeous sunsets that are often worth the price of admission; and the moon comes out—sometimes—and the stars one by one, and then by regiments, and the man who does not love all this has no music in his soul, and we have been told what he is fit for. If he wanted fish only the law would prevent his using dynamite.

Rock in your little boat, fill your lungs with the air before it is tainted by touching the city, play with toy tackle and catch a basket of toy fish with the same tactics and skill your friend boasts he uses on his big ones, once a year, and when you go in to-night and he jollies you about your catch, tell him what you saw and ask him if it wasn't better than to spend the evening in the hot room, or hotter street, with no escape from hearing him tell once more about "the greatest catch I ever made."

HENRY TALBOTT.

The Tourilli Club.

At the tenth annual meeting of the Tourilli Fish and Game Club, of Quebec, Secretary George Van Felson presented a very interesting and complete report, covering the proceedings of the past year and giving many statistics of interest to the members. The club has a most successful year, and its financial position is exceedingly satisfactory. Its limits are more extensive than those controlled by any other similar club in Canada, and it owns real estate to the value of \$16,000. During the year several lakes hitherto untenanted were successfully stocked with trout. A new species of trout has been discovered on the club waters which runs up to 4½lbs. in weight and is the most beautiful and gamy of the Salmo family. A specimen has been sent to the Smithsonian Institution and has awakened a great deal of interest amongst scientists. It is generally supposed to be the very rare and much coveted *Salmo marstoni*. At the request of the Hon. Commissioner of Lands and Forests an oil painting of the fish and a mounted specimen will be forwarded to the Sportsmen's Exhibition to be held in New York next March.

The election of officers resulted as follows:
Patron—His Excellency the Governor-General.
President—Commodore J. U. Gregory, Quebec.
Vice-President—Archibald Laurie, Esq., Quebec.
Secretary and Assistant Superintendent—Capt. George Van Felson.
Treasurer and Superintendent—E. A. Panet, Esq., St. Raymond.

Committee—Glen Ford McKinney, New York; Frank Cunningham, New York; Ed. Van Ingen, New York; G. M. Fairchild, Quebec; J. A. McSloy, St. Catharines, Ont.; Graham H. Harris, Chicago, Ill.; W. F. J. McCormick, Philadelphia.

The club's lease from the Government has been renewed for another ten years, and they are applying for the exclusive hunting privileges on their territory.

Springvale Fish and Game Club.

SPRINGVALE, Me., Jan. 30.—*Editor Forest and Stream:* I send you copy of by-laws of Springdale Fish and Game Club, recently organized for the promotion of our fish and game interests. We have been trying for some years to stock lakes near by with salmon, and last fall, in spawning season, some large ones were killed; hence the organization of this club. We intend if possible to stop this slaughter of fish, especially in closed season. A. J. MCGIBSON.

The Quebec Game Laws.

A DEPUTATION of the Fish and Game Protection Society of the Province of Quebec last week waited on Hon. S. N. Parent, Commissioner of Crown Lands, Forests and Fisheries, to suggest some alterations to the game laws, which in the opinion of the society are necessary for the better protection of fish and game. The society's representatives were President Finnie; the secretary, Mr. W. Cleghorn; Dr. F. W. Campbell, and Messrs. W. L. Maltby, G. Boulter, E. Wanklyn, W. Parker, Meredith, and Jos. Riendeau, Provincial Game and Fisheries Inspector.

There are nine main provisions which the society wishes to see incorporated in the bill which Hon. Mr. Parent has on hand: The close season extended to cover sheldrake loons and gulls, which may be shot throughout the year at present, and the forbidding of the slaughter of insectivorous birds at any time; in both these cases it is claimed that the law is taken advantage of to carry on poaching under its shelter. A somewhat similar objection is made to issuing graded licenses of from \$1.50 up to \$20, and it is urged that a uniform license to carry a gun should be issued. The fourth demand is for the protection of raccoons, and the fifth that the taking out of a gun license should be made universal, but without charge to residents of the Province. The number of partridges has shown serious diminution during the last two years, and the deputation suggests that the sale of these birds should be suspended for three years, but not the shooting. In view of the increased depredations of wolves in the province, the deputation suggests that a bounty of \$2 per head should be offered for their slaughter in organized counties. The export of trout and game fish except salmon is to be forbidden, but sportsmen are to be allowed to take 40lbs. of their catch out of the Province. Lastly, it is asked that the use of any kind of net in the inland lakes and ponds should be entirely prohibited.

Among those who attended the conference was Mr. Chas. Stewart Davison, of New York, whose interest in securing a wise system of administration for the salmon rivers of the Province has been demonstrated by his careful study of conditions and his recommendations based upon such study. Mr. Davison sends us the subjoined letter, which has been sent by him to Commissioner Parent:

JAN. 30.—Hon. S. N. Parent, Commissioner of Lands, Forests and Fisheries, Quebec, Canada—My dear sir: I take the first opportunity after my return from Quebec to write, both thanking you for your many courtesies during my visit, and also—if you will permit me so to do—to compliment you upon the firm and enlightened policy which it is evident the Province, under your guidance, purposes adopting in relation to fish and game, and more particularly in relation to the preservation of salmon.

All the attendant facts in relation to this asset of the Province I feel are already so well within your grasp that there is nothing I can add which would tend to further illumine your mind upon the subject, and yet I cannot refrain from briefly recapitulating those leading arguments which bear so directly upon the advisability of rigidly restricting netting in the estuaries. The rivers of the Province are the storehouse, the breeding ground, the natural hatcheries. From the time the salmon approach the mouth of a river, pursuing the natural instinct of the fish, until the time when they return from the rivers to the sea, they should be scrupulously guarded, exactly as a farmer protects his breeding ewes or the productive cows of his flock of sheep or herd of cattle.

To allow the placing of a net in an estuary is for the Province to accept at the mouth of the river perhaps \$50 as the purchase price from it of that which twenty miles further up the same river, at an expense of some thousands of dollars per annum, it must attempt to put back by means of an artificial hatchery.

If the netter in a river's mouth will pay the full annual expense to the Government of supporting a hatchery further up the river, he will be then returning to the Government the real value of his netting privilege.

The whole question is simply the question of "protecting" fish in the same way that one would, as I have stated, conduct a stock farm of cattle, sheep, horses or any other domestic animals.

A netting privilege in an estuary means in fact the placing of at least two (sometimes five or more) nets stretching out into the narrowing waters from the shore, so that their ends (even if they are not opposite each other) will overlap any straight line which can be drawn down the channel.

This means that the great majority of the breeding fish of that particular river must be taken on their way to the spawning grounds; and the principle which you have adopted in the bill which you have prepared—a basic line within which, on either side of the estuary, no net shall be set—is absolutely the only way to prevent the barring of the channel to an approaching fish.

Salmon naturally, almost, one might say necessarily follow the stream or current (especially when the tide is out).

The barring of the channel can only be prevented by a sufficient reserved space on each side of the estuary.

This matter of estuary netting is, as I ventured to point out to you, the subject to-day of the same struggle in England which you are so happily solving for the Province of Quebec. In England they have to contend against ancient private grants from the Crown no longer subject to strict regulation by the fisheries commissioners. But in the Province of Quebec, as is pointed out in one of the appendices to your annual report, a much more fortunate state of affairs exists in this respect. The Province itself still owns the absolute right to and the control of the estuaries, and no prescriptive rights exist to prevail against the benefit of the many, the good of the people at large, while merely subserving the selfish interest of the very few.

I venture to remind you in this connection of the argument which was advanced at the meeting held on the 24th instant: that people at some of the rivers were beginning to think they had prescriptive rights because for many years they had had licenses. It is against the future prevailing of this "counsel of evil" that it becomes

Of y^e Town of BOSTON

on y^e MASSACHUSETTS Bay:

Y^e fellowcrafte member,

Dr. George McAleer

Of y^e Quinsigamond Plantation, now called y^e Hearte of y^e Commonwealthe, sends Greetinge, and warns y^e brother hood to meete in his goodlie citie JANUARY 28th, Anno Domini 1899, to make y^e day merrie fyshinge through the ice for y^e Pickrel.

For y^e disporte he will furnish all y^e tilts and bait, but y^e Brotherhood will bring emptie stummicks and chunks of fun to make divertisement in plentie.

Nota Bene.—To y^e best storie goes y^e biggest fyshe.

DR. GEORGE MCALEER'S INVITATION CARD.

the more important to now enact the provision which you have put into the statute, so that hereafter, while in special cases where it may be desirable for other reasons licenses may be permitted, nevertheless no one will be able to claim that he enjoys such license as a matter of right, but in each instance it will be matter of special favor, and be liable to be revoked or extinguished whenever it becomes demonstrated that the supply of fish is injuriously affected in the particular instance by its existence.

If, as I have said to you before, it were the fact that salmon which were bred in rivers, say along the Labrador coast or in the Arctic, would indiscriminately enter your rivers, then nature's general storehouse might be called upon to keep all the rivers stocked. But as is so well known, each river in the Province is compelled by natural laws to be substantially its own storehouse, and one by one as the rivers are exhausted they definitely cease to be salmon rivers until restocked and protected.

As was said in one of the discussions before you, there are to-day in the Province (including all rivers from Niagara Falls to Blanc Sablon on the north, and to New Brunswick on the south) at least 200 rivers which were once productive salmon rivers, and could be made so again every one of them, and leased at several hundred dollars apiece a year, which nevertheless to-day are (from this point of view) worthless. Let us see what this would mean to the Province.

Let us suppose that these rivers were to-day, as they once were, well stocked with salmon. Some of them have been in the past and would be again remarkably, even enormously, productive, and would lease for large sums. Others, smaller rivers, or in which the fish-run of smaller sizes, would not lease at such high figures. But an average rental of \$500 would not be an extravagant but a very modest figure to assume. This would mean to the Province primarily \$100,000. Let us now consider what it would mean further. It would mean 200 more angling parties each year in the Province. It is fair to assume that from two to twenty men (on the average say four) would be permanently employed on every river, their average wages (including nourishment) could not be placed at less than \$400 per annum. This would mean an

item of \$320,000 in wages. Again, 200 parties of anglers either building houses or fitting out with tents, camp outfits, food (for three weeks or more each year), and obtaining, as they do, because of cheaper prices, flies, reels, leaders, lines, rods and other paraphernalia in Quebec and Montreal, assuming that each party did not average more than three persons, and they did not expend more than \$200 apiece (which I know to be a very low figure), would mean an additional \$120,000 spent in the Province.

Their railroad and steamboat or wagon transportation and the employment of attendants while on the rivers adds still further items to the accruing benefits from their presence.

But another and still more important point arises, and I do not hesitate to bring it to your attention somewhat at length, for the reason that it has not as yet been mentioned.

The constant traversing of your forests and visiting of your rivers by persons from the United States who visit the Province of Quebec to angle for salmon. This means a continual inspection of your natural resources in timber, pulp wood, water powers, by numerous persons belonging to the class of those who invest in manufacturing enterprises. Is it to be doubted that any device by which the Province of Quebec could cause a number of American business men to annually visit and inspect her timber limits and water powers would tend directly to the exploitation and development of the natural resources of the country.

The salmon anglers of the United States are largely men of affairs seeking rest and recreation—off on their vacations. The question for the Province to decide from this point of view is:

"Will the Province take such steps as will induce these people to spend their vacations in the Province of Quebec, or does the Province prefer to have them go to Maine, Scotland or Norway?"

Permit me also to recall to your attention a further suggestion which was made to you. The Province in issuing angling licenses should bear in mind that there should be in every angling license the reservation of the whole of some designated tributary of the river (to be selected by your Department after a sufficient examination

to insure the fact that it contained appropriate spawning beds, and was utilized for this purpose by the salmon) to serve as a natural storehouse or hatchery for that river. Such reserved waters should be included within the lease and the angler should be compelled to guard and protect them as well as the rest of the river, but he should be forbidden, under a round penalty, and prevented from angling therein or from unnecessarily disturbing their waters. Were a lessee to angle in such reserved space it would be the best proof that the Province should not accept him as a lessee of any river. But I feel sure that in this matter the Province could rely on the entire co-operation of the lessees, and that such a restriction being directly for the benefit of all would be welcomed by each.

You will remember that I made certain sketches showing the method of applying "the 500yd. limit rule" to the mouth of a river, and ventured to suggest the insertion of a provision in the section providing for such maps, which I believe met your approval. After the preparation by your civil engineers of an official map, showing the mouth of the river, it should be submitted to you that in accordance with the provisions of the act you might definitely mark thereon (A) the limits of the tidal estuary; (B) the limits of the 500yd. space on each side; (C) the limits of the first netting license on each side of the mouth of the river. These maps, when so approved or legalized by yourself, would be filed with your Department, a copy thereof being obtainable by any person interested on payment of a reasonable fee. Such official maps would serve to definitely prevent interminable wrangling on the application of the law to the particular river, and on the question of whether a particular net was legal or illegal. Without such precaution the beneficial provision of the statute must almost necessarily be lost. With such official maps on the other hand the decision of the fishery overseer or the magistrate becomes simple and accurate in each instance, and also no injustice could be done to any party concerned. As indicating further the application of this suggestion, I beg to enclose you herewith some sketches of possible conditions at the mouths of rivers. You will observe that the method adopted covers the debatable question of "high tide" and "low tide," and would be efficient under all circumstances. The mouth of a river at "low tide" is often well to one side, and might not seem to be its mouth at "high tide," and for this reason the use of the word "mouth" in the first paragraph of the article supplemented by the provision that you shall determine for each river the "limits of the tidal estuary" is a happy solution of what might otherwise be a different matter. I trust that no change in the statute as you have worded it in this respect will be permitted.

I have left untouched, as you will see, the further question of benefit to the Province from the increased protection of the fish. There are, however, certain primary facts which can be confidently alleged. The netters, if forbidden to net in the mouths of the rivers, will, within three years, be taking at least twice as many salmon in the coast nets as they are now taking in the rivers. The suicidal policy of netting the river itself is what keeps down the entire catch. I do not suppose that there are in the Province to-day 250 individuals who make in money \$100 apiece a year by netting salmon at the mouths of rivers. Of course, a few individuals make larger sums of money, but I repeat that not 250 people make each \$100 in money from netted salmon. But it is beyond a peradventure that with proper protection of the estuaries a very large number of the coastwise inhabitants would maintain successful coast nets and catch more fish, all without substantial detriment to the continued supply of fish.

Again, the sale of salmon as a commercial product would increase very greatly. As I ventured last August to recommend to your Department, there should be regulation of the sale and purchase of salmon. Licenses to deal in salmon should be granted to responsible persons only, and be conditioned upon their buying only from legal sources of supply. This would make the holders of licenses the active subagents of the Government to suppress illegal dealers. In their turn the owners of duly licensed nets would become the subagents of the Government to suppress illegal netters, and with your overseers and magistrates aiding the Government in its endeavors, a complete system would without material expense come into existence.

In conclusion I would apologize for infringing upon your time to the extent which I have in this lengthy communication, were it not that I fully appreciate, from the time which you so willingly gave to the subject during my visit to Quebec, and from the interest which you have so constantly displayed, that you bear the real importance and the true merits of the matter clearly in mind.

I remain with great respect your obedient servant,
CHAS. STEWART DAVISON.

Preserved Trout and Hen Roosts.

Your correspondent, Lexden, seems to think that catching trout out of a preserved stream is on a par with robbing hen roosts. It's different. At least, it may be different. This proves it: A person who would not dream of robbing hen roosts under any circumstances will catch trout in forbidden waters under some circumstances, such, for instance, as those narrated by the correspondent about whom Lexden writes. The two things are different. ARGONAUT.

District of Columbia Association

The second annual meeting of the Game and Fish Protective Association of the District of Columbia was held on Monday, Feb. 6. Interesting remarks were made by distinguished gentlemen, and statements rendered of the condition of the association and the excellent work that it has accomplished.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

Pennsylvania Fishing Interests.

THE Pennsylvania Fish Protective Association has elected officers for 1899 as follows: President, Dr. Bushrod W. James; Vice-Presidents, Howard A. Chase, Wm. P. Thompson, Wm. H. Burkhardt; Corresponding Secretary, J. P. Collins; Recording Secretary, M. G. Sellers; Treasurer, S. E. Landis. Executive Committee: Jacob Dowler, Wm. E. Meehan, Edward A. Selliez, Chas. Zimmerling, Wm. S. Hergesheimer, John Moore, George T. Stokes, Joseph B. Van Dusen, Jr., and Edwin Hagert. Trustee (three years), Collins W. Walton.

Secretary Sellers writes us a newsy letter regarding the work of the association and allied organizations. He says:

Legislative matters really commenced on Nov. 23, when a conference was held at Harrisburg between the Fish, Game, Forest and Health Boards, the Pennsylvania Fish Protective Association and the State Sportsmen's Association to consider that subject. After a full interchange of opinions it was the sense of the meeting that a committee of one from these respective bodies should convene on Dec. 10 for the purpose of adjusting the protective features of these several interests. This meeting was held in Harrisburg, a full attendance being present as follows:

Dr. J. T. Rothrock, representing the Forestry Commission.

J. H. Warden, representing the Game Commission.

Wm. E. Meehan, representing the Fish Commission.

Dr. Benjamin Lee, representing the Health Board.

Hon. Frank G. Harris, representing the Legislative Committee of the State Sportsmen's Association.

M. G. Sellers, representing the Legislative Committee of the Pennsylvania Fish Protective Association.

The outcome of this and a subsequent conference, held Jan. 2, was the bill enclosed, covering stream pollution, though as reprinted in small type first section is not included as in type-written copy, and it is a question if it can be retained legally, though we have strong hope of doing so.

Another bill was drafted making constables of townships and boroughs ex-officio fire, game and fish wardens, prescribing their power and duties, fixing their fees as wardens, and prescribing their punishment for failure to perform their duties.

The fish bill (general bill) is about drafted complete and will be introduced this week; it is strongly drawn, and the number of sections is greatly reduced; two of the features are of course a 6in. trout limit and 9in. bass limit; it will provide a warden system also, and there are other radical changes from former bills.

The deficiency bill, to reimburse subscribers to the fund to maintain the hatcheries and to pay outstanding accounts, calls for a sum of \$21,000, and has already been favorably reported by the Senate Committee, and indications are that it will pass House and Senate.

The several hatcheries have full quotas of trout fry, and the output will exceed that of last year. At the Allentown station more eggs were taken than last year, and the surplus stock we are sending to proper persons having retaining ponds and troughs for rearing to relieve the crowded condition of the limited trough capacity at that station.

The Legislative Committee of the association has been appointed as follows: Howard A. Chase, Henry A. Ingram, M. G. Sellers, B. L. Douredoure and Wm. P. Thompson.

What might perhaps gladden the angling fraternity most is a hitherto impossible (so considered) effort to preserve to the angling public the many desirable waters suitable to trout, and which from the constantly increasing tendency to leasing have gradually lessened. To correct this has been my whole aim, and I think I have hit a plan; in fact, have a bill drafted with that purpose in view, and will forward it at time of presenting. I also provide in this bill the creating of nurseries for fry planting all over the State, by giving such waters in control of Fish Commission, compensation being provided for, and to prohibit all fishing on such by-streams. I could give you volumes on this subject but for time.

M. G. SELLERS.

The bill referred to by Mr. Sellers provides:

Section 1. Be it enacted, etc., that the State Board of Health shall be and is hereby authorized to examine into the water supplied to municipalities of this Commonwealth and used for domestic purposes, for the purpose of ascertaining whether said water is pure, wholesome, and free from substances prejudicial to the public health.

Sec. 2. Should it be ascertained that the water supplied, as aforesaid, contains matter prejudicial to public health, the said Board is hereby authorized and directed to make such investigation as will ascertain the causes of such pollution, and thereupon take measures for the removal and abatement of said causes, so that the water supplied as aforesaid may be made, and remain, pure and wholesome.

Other sections prescribe modes of procedure to enforce these provisions, and make the penalty not to exceed \$500 fine and three months' imprisonment. The portion of the drafted copy which was omitted was an entirely reasonable prohibition:

That it shall be unlawful to put the carcass of any animal, or any spoiled meat or fish, or any putrid animal substance, or garbage, or sawdust, or the contents of any privy vault, or any manure, or any liquid containing in suspension or solution any substance rendering such liquid dangerous or deleterious to the health, or unfit for domestic use, upon the bank of or into any pond, lake, river, stream, canal, or other water course within this State, which is or shall at the time be used for the supply of water to the public, or shall be tributary to any body of water from which a public water supply shall be taken. Provided, that this act shall not be so construed as to prohibit the sewerage system of any municipal corporation, or the cultivation and use of the soil in the ordinary methods of husbandry, excepting the use of human excrement as manure, or boating, bathing or fishing, or so as to prevent the operation and drainage of coal or ore mines.

Range of the Cero or Kingfish.

BOSTON.—*Editor Forest and Stream:* Can any reader of FOREST AND STREAM inform me whether the cero or kingfish, *Scomberomorus cavalla* (I think I have this right), found in Florida waters, off Jupiter, Biscayne Bay and Key West, are found in other localities, and where? Are they ever taken with the rod? I have caught them in Florida by trolling just along the edge of the Gulf Stream from a point off Jupiter Inlet to Fowey Rock Light, and Ameri-

can Shoal Light, near Key West, but have heard nothing of their being caught elsewhere. They are great fish, and I think a gamy one, judging from the way they leap in striking.

Can you inform me of the fishing and gunning along the Gulf Coast of Alabama and Mississippi, and the best point to locate for a month's stay.

READER.

[The kingfish, cavalla, cero, or sierra, by all of which names it is known, ranges in the Atlantic from Africa and Brazil north to Cape Cod; it is very common on the Florida coast; immense catches are made off Palm Beach and at Key West. For a Mississippi headquarters Bay St. Louis or Biloxi might well be selected. Good quail, snipe and duck shooting will be found in the surrounding country, and the fishing is excellent. Oyster sloops may be chartered for excursions to the Chantelour Islands.]

The Kennel.

BENCH SHOWS.

Feb. 8-11.—Milwaukee, Wis.—Bench show for the benefit of the Wisconsin training school for nurses. E. J. Meisenheimer, Sec'y.

Feb. 21-24.—New York.—Westminster Kennel Club's twenty-third annual show. Jas. Mortimer, Sec'y and Supt.

March 7-10.—Grand Rapids, Mich.—Butterfly Association's bench show. Miss Grace H. Griswold, Sec'y.

March 14-17.—St. Louis, Mo.—St. Louis Kennel Club's show.

March 21-24.—Chicago.—Mascotah Kennel Club's show.

April 4-7.—Boston, Mass.—New England Kennel Club's bench show. James Mortimer, Manager.

Nov. 22-24.—New York.—American Pet Dog Club's show. S. C. Hodge, Supt.

International Field Trial Cup.

Editor Forest and Stream:

I send you to-day a photograph of the very handsome cup donated to the club by Mr. Thomas Johnson, which has just arrived from Winnipeg. The cup was to go to the winner of the All-Age Stake at the late trials, and

Mr. Geo. Kime's English setter dog Noble Chieftain was the lucky dog. Mr. Johnson was unanimously elected an honorary member, in recognition of and as a slight return for his generous support of the club since its start in 1889.

WM. B. WELLS, Hon. Sec'y I. F. T. C.

Shipwrecked Dogs in Port.

THE steamship Aragonia, of the Red Star Line, which arrived yesterday from Antwerp, had aboard two passengers not on the passenger list and not manifested. They were two fox-terriers which were taken off the wrecked and abandoned steamship Gallina, in latitude 50 degrees 21 minutes, longitude 24 degrees 59 minutes. The crew of the Gallina was rescued and taken, part of it into Liverpool by the steamship Kanawha, and part into Bristol by the steamship Charing Cross. The dogs were turned over to the Society for the Prevention of Cruelty to Animals.—New York Times, Jan. 21.

Irish Terrier Club of America.

At the coming show of the N. E. K. C. at Boston, the Dare Devil Stakes will be decided. Besides, the club offers the following specials: \$5 cup for the best brace American-bred Irish terrier pups, bred and owned by the exhibitor; \$5 cup for the best dog or bitch, American-bred, in puppy classes; \$5 cup for the best dog or bitch, American-bred, in novice classes; \$5 cup for the best dog or bitch, American-bred, in limit classes; \$5 cup for the best dog, American-bred, in open class; \$5 cup for the best bitch, American-bred, in open class; \$5 cup for the best Irish terrier in show, American-bred, uncropped.

O. W. DONNEX, Sec'y.

Points and Flushes.

Those who will turn to Answers to Correspondents will find several queries from parties who wish to purchase dogs. The answers thereto will explain our inability to give the information so much sought by the inquirer and of such material value to breeders.

Ripsey.

BALTIMORE, Feb. 2.—Ripsey is grand. I had his counterpart in my old dog Bob fifty years ago. Oh, how the picture takes me back to my early years.

E. S. YOUNG.

Yachting.

As the yachting journal of America, the FOREST AND STREAM is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

It seems, as we conjectured at the outset, that the Dominion has proved a very hard nut to crack, and that thus far no method of barring her on fair technical grounds has been discovered. The revised conditions for the Seawanhaka cup match of 1899, as just published, make no allusion whatever to her, and if they bar the type at all it is indirectly and in a roundabout way. If a designer is skilful enough to cut down Dominion's over-all length by 3 ft. 4 in. and to bring the gunwales together at the fore end with a "fair" sweep within a total angle of 70 degrees, he is apparently at liberty to divide the bottom of the hull at will; at least up to the water, if not to the full extent of Dominion.

Whatever the indirect penalty on the Dominion type, the changes hit directly at another type, which was produced by and fully developed by the Seawanhaka cup races. This is the scow type, introduced by Mr. Huntington in Question, the 15-footer of 1895, followed by Willada, Hope, Skate, Kenen and Akabo. The different varieties of square bows developed in these boats are all prohibited under the restrictions of Article IX., and a decided change of model will be necessary to adapt this division of the scow type to the future races for the cup. The particular type which is directly recognized by the revised conditions is that originated by Mr. Duggan in Glencairn I., perfected in Glencairn II. and Speculator, and adopted by Mr. Crane in Seawanhaka, Cicada and Challenger.

As far as practical results go, this type is in no way nearer to the wholesome yacht than Dominion is, and as a racing machine it is decidedly inferior in speed, and also in seaworthiness, as tested up to the present time.

The problem of producing anything better than an extreme racing machine is just as far from a solution as it was a year ago, nor has it been advanced by the recent change of the Quincy Y. C. conditions in the same direction as the Seawanhaka C. Y. C. The newly revised conditions of the Quincy Y. C. challenge cup contain the following restriction: "No point of any cross section of a yacht shall be lower than its center." While this does effectually bar the double-hull boat, it fails entirely in the main object of promoting a desirable type of racing machine, which is all that can be asked in these cup matches. Under this restriction, a man may build any sort of misshapen box, with no semblance of a yacht and no good quality to recommend her except speed obtained by a palpable evasion of the letter and spirit of the measurement rule. At the same time, he is forbidden to build a freak of somewhat different form, but of decided superiority in speed and other qualities.

If it is fair and legitimate for a designer to abandon all conventional yacht forms with déadrise great or little, and to build a box with a perfectly flat bottom, there is no sound scientific reason why he should not put in a hollow of 1, 2, 3 or even more inches if he gains speed thereby. Even admitting that his rights stop at the water and that a yacht with a hollow showing above water should be barred as of a different type, it is obviously most unreasonable and unjust to penalize the one particular detail of what may be called "negative deadrise," while recognizing the legitimacy of all kinds of freak forms.

The attempts thus far made to bar the Dominion type, as in these two instances, merely go to prove that the yacht clubs are not able to handle this important question in a scientific manner, but are forced to resort to superficial restrictions which can accomplish no permanent good.

Yacht Designing.—XXIII.

BY W. P. STEPHENS.

(Continued from page 77, Jan. 28.)

The illustrations accompanying this article are copyrighted by the Keuffel & Esser Co., New York, to whom we are indebted for their use.

CONVENTIONAL measurements, according to some fixed standard such as the foot or meter, are made in two ways, directly, to the exact size of the standard; or indirectly, to some smaller (or larger) absolute size, but with all divisions in proportion to the original. For the former purpose, which is that of the builder rather than the designer, the familiar 2 ft. rule is used in America and Great Britain; a tool that hardly needs an illustration or a detailed description. On it the standard unit, 1 ft., is divided into twelve equal parts, each called an inch. The inch is commonly subdivided into sixteen parts, or on one edge of the rule into eights and on another into sixteenths. In surveying, general engineering work, and in the racing measurements of yachts, the foot is divided into ten instead of twelve parts, each having no other name than tenth, and these in turn are also decimally divided into hundredths. Convenient as it is in many ways, the decimal division is not used in yacht building, the inch being preferred, through long use, to the tenth. In France and the other European countries the metrical system of weights and measures is exclusively

used, the unit of length being the meter, nominally one-tenth millionth part of the quarter of the earth's circumference. The standard meter is equivalent to 3.28 ft. and to 39.37 in. Its subdivisions, all, of course, decimal, are the decimeter, 0.3937 in.; the centimeter, 0.3937 in.; and the millimeter, 0.03937 in. In French and German designs the scale is always a portion of a meter.

The rule or measure, as already stated, is an instrument for actual construction, full size; but the work of the designer is necessarily done on a very much smaller scale, from one-twelfth to one-forty-eighth size. What is called a *scale* is a miniature copy of the common carpenter's rule; reduced to one-eighth, one-twelfth, one-twenty-fourth full size, etc. Scales or miniature rules are used in all branches of the draftsman's work, and they vary greatly in size, divisions and other details. Where it is necessary, through lack of space, to make a drawing to some reduced size, of course retaining all the proportions of the original object, the simplest form of scale is that found on the common carpenter's rule. If the eighths of an inch, as marked on the rule, be assumed to represent each 1 in., then twelve of them, covering 1 1/2 in. on the rule, will represent 1 ft.; and the scale will be 1 1/2 in. to the foot. If we take the other edge of the rule, with its division into sixteenths, each sixteenth will represent 1/2 in. For any ordinary plotting to scale on the bench, this impromptu scale is very convenient.

For regular use on the drawing board, special scales are made, the unit, representing the foot, being divided into ten or twelve equal parts, and these in turn being subdivided into more minute spaces, according to the accuracy required by the particular work in hand. For marine drafting the smallest subdivision is seldom less than 1/48 in., a distance representing 1/4 in. on a scale of 1 in. to the foot; 1/12 in. divided by 4. The smallest scale of feet and inches is that of 1/8 in. to the foot, in which the subdivisions representing inches (1/96 in.) are marked. The scales in common use are: 4, 3, 2, 1 1/2, 1, 3/4, 1/2, 3/8, 1/4 and 1/8 in. to the foot. These scales, divided duodecimally to represent inches and their fractions, are used in

Fig. 54—Open-divided Scale.

Fig. 55—Full-divided Scale or Chain Scale.

laying off and measuring designs, and for all work that goes to the builder. For many purposes of calculation, the decimal scales are used, the scale of 100 parts to the inch corresponding with that of 1 in. to the foot; the scale of 40 parts to the inch corresponding with the 1/4 in. scale, etc. The usual decimal divisions are 10, 20, 30, 40, 50, 60, 80 and 100 parts to the inch.

The varieties of form, material, construction and methods of division in scales are so numerous that it is difficult to classify them according to any system. The first division which suggests itself is that of *straight scales*, intended for measuring straight lines, and *curved scales*, as they may be called, for measuring angles, the common name being *protractor*. These two varieties may be further subdivided into *plain scales* and *plotting scales*. In the *plain scale* the division may be made at any convenient place on some flat surface; the scale being used by applying the *dividers* or a straight strip of paper to it and setting or marking the desired distance; the *dividers* or paper being then applied to the drawing, and the distance set off; or the process is reversed, some distance on the drawing being taken off with the *dividers*, which are then applied to the scale, giving the measure of the distance. A very familiar instance of the *plain scale* is found in the Coast Survey charts, on which are printed, in a corner or near the margin, a scale of statute miles, a scale of nautical miles, and a scale of kilometers. The *protractor* is also represented on the chart by one or more *compass roses*, divided into points and sometimes into degrees as well.

The *plotting scale* is not only entirely separate from the drawing, but all the divisions appear on the edge, so that the scale may be used by applying directly to any part of the chart or drawing and marking or measuring the desired distance. The *plain scales* were much more used formerly than at the present time, when a larger demand and more perfect machines for graduation have improved the quality and lessened the cost of single wood or metal scales; so that a number of *plotting scales* are used, in place of one or two *plain scales*. Certain forms of the *plain scale*, such as *Gunter's scale* and the *sector*, are still used in navigation, chart making and trigonometrical calculations, but not in ordinary drafting. For all ordinary plotting and measuring, the separate *plotting scale* is far more convenient, but there is one form of *plain scale* which is still used. No kind of drawing paper or cloth is free from contraction and expansion from atmospheric causes, and where extreme accuracy is essential the scale of the drawing is constructed directly on the paper, thus altering in size with the lines themselves. In printed drawings of any kind, charts, yacht designs, etc., such a *plain scale* is always useful, as the paper must be wetted in the printing and through this or other causes the printed lines may differ very much from the original drawing.

Still another important difference in scales is in the methods of division or graduation, of which there are three:

Simple { open divided,
 full divided.

Diagonal.

Vernier.

In *simply-divided* scales a line, either the edge of the scale if a *plotting scale*, or at some convenient place if a *plain scale*, is divided into a number of equal parts. In the *diagonal scale*, which is of necessity a *plain scale*, to be used only through the medium of the *dividers*, the subdivision is carried much further by means of diagonal lines. In the *vernier*, the main scale is accompanied by an auxiliary one, by means of which very minute measurements may be made.

Taking first the *simply-divided* scales, they may be in turn divided into two kinds, called *open divided* and *full divided*, or *chain scales*. On the *open divided* scale, Fig. 54, the unit, as 1 in. or 1/4 in., is laid off a certain number of times, according to the length of the scale; but only one of the end divisions is subdivided to represent the inches and fractions. On the *full divided* scale, Fig. 55, each unit for the full length of the edge is subdivided. The architect's scales, as they are sometimes called, of inches or parts of an inch to the foot, with duodecimal divisions, are usually *open divided*; while the *engineer's scales*, of so many parts to the inch, decimally divided, are usually *full divided*.

Scales are made in several forms and of different materials, steel, German silver, ivory, boxwood and cardboard, not to mention some of the commoner woods. The steel scales are largely used by machinists at the lathe and bench, being accurate and durable; they are not convenient for the draftsman, except that a standard steel rule of 2 ft. or more in length is a great convenience in laying off the main lines of a drawing and establishing accurately the principal points. German silver makes a light and durable scale, but the surface is trying to the eyes, and the smaller divisions are hard to read. At the same time it is well adapted for very accurate measurements, as a fine needle may be slipped down the smallest division of the scale until it touches the paper. Ivory was once highly esteemed for scales, but there is no excuse to-day for putting money into this material, as, being given to warping and twisting, it is less durable than other less costly materials. The plain boxwood scale is quite as good as ivory in practical use, and costs only one-fourth the price; but a still better scale is made of boxwood faced with a white substance, which shows the back lines in bold contrast. These scales, introduced not many years since, but now generally sold, are as good as any that can be had. A cheap scale, costing about 20 cents each for an 18 in. length, is printed on cardboard, usually full divided, and to be had in all the standard divisions of the architects and engineers' scales. It is

light, easily read, and the divisions are accurate, being carefully cut out on the stone from which the scale is printed; but its accuracy in another direction is not to be implicitly relied on, as the cardboard will shrink more or less after printing, so that the total length of the scale varies a little from the absolute standard of a good wooden scale. In many cases this is a matter of small importance, the error of the scale is no greater than the shrinkage of the drawing paper after the first lines are plotted; but on the whole it is more satisfactory to have a full set of scales of the wood and composition mentioned.

The Canada Cup.

The Hamilton yachtsmen promise to take an active part in the defense of the Canada cup, as three 35-footers are building there. One is for a syndicate including Messrs. F. E. Walker, Wm. Burnside, R. C. Chilman and F. Carpenter, the yacht being built by Robinson and Burnside. Another is for a joint stock syndicate, the shares being \$50 each, Messrs. Fearnside and Johnston being at the head.

On the other side of the Lake the Rochester Y. C. has formed a syndicate, and the following committee has been appointed: Com. A. G. Wright, Vice-Com. Norman E. Compton, J. G. Averill, Frank T. Christie, J. E. Burroughs, T. B. Pritchard, James S. Watson, Fred S. Rogers, James S. Graham, Arthur T. Hogan, J. R. White, Frank S. Peer, E. N. Walbridge, Buell Mills and Albert E. Vogt.

Messrs. Watson and Sibley have each subscribed \$1,000 toward the yacht. A stock company will be formed, the shares being \$10 each.

The following is from the Chicago Herald:

Great secrecy is manifested in the construction of a yacht on a little island in the Calumet River, near the east bank at Ninety-third street. Two armed guards were the only tenants of the island yesterday, the workmen having laid off because of the cold weather.

A 25 by 60 ft. frame structure, within which the model was hidden, was locked, and a request to be permitted to look at the boat met with a peremptory refusal. The watchmen claimed not to know the names of the proprietors of the miniature shipyard, nor to what use the craft under surveillance would be put when completed.

From another source the information was obtained that a yacht was being built on racing lines, presumably to compete in the Canadian cup races.

The plot of land upon which operations are being so secretly conducted is a disused stretch of sand and shrubbery known as Hausler's Island. Its selection was doubtless the result of the seclusion it offered. Now that its use is made known, knowledge of the mysterious yacht may soon follow.

The Lake papers are still busy with the complaints from Toledo, which we mentioned last week.

On Jan. 31 Mr. C. H. Crane delivered the second of his lectures on yacht designing before the Seawanhaka C. Y. C. On Friday, Feb. 10, Mr. Dwight L. Elmen-dorf will give a lecture on the late war, illustrated by stereopticon views of the battle of San Juan, the destruction of Cervera's fleet, etc., from photos made by the lecturer. Com. Rouse has appointed Herbert L. Satter-lee as fleet captain and Eugene S. Willard as signal officer.

Wayward, cutter, has been sold by D. S. Ellsworth to Chas. Smithers, who will alter her to a schooner.

The First Voyage of Zulu.*

It was a foggy and dismal afternoon in early May when the writer and his friends gathered on the pier at Cobourg and proceeded to get ready for sea; so damp and chilly that there was some little wavering about the expediency of putting to sea so late in the day. But we had already postponed the start from day to day for one cause or another, and were anxious to be off, and as to the lateness of the hour we had no intention of running very far, but merely wished to get off so as to have crew and stores aboard to take advantage of the first favorable opportunity. So accordingly about 5 P. M. Zulu slid out between the piers and soon dropped them in the mist astern. The wind was light from the west, almost dead ahead, and we made a long board out into the lake, finally coming about with the expectation of picking up the Gull Light, which, in the course of another half-hour, we did; and coming about again for another board off shore we soon lost sight of it to leeward. Another couple of tacks and we were abreast of Port Hope, and the wind being still light and adverse, and daylight beginning to fail, we ran into the harbor to wait for better times and to purchase some necessary supplies which had been forgotten. A comfortable hot supper was soon ready, and then we had some music, vocal and instrumental, and finally turned in with good hopes of a favorable run on the morrow.

It blew fresh during the night, but still from the west, and as we could hear from our berth, there was a nasty sea running, so we lay quiet until within an hour or less of daylight; and then, finding the wind going down, with some prospect of a shift, we cast off our lines, and under easy sail slid out again between the piers.

The next two hours were trying ones for the crew, who had not yet got their sea legs, the yacht jumping and kicking in a sharp, high sea, with only enough wind to steady her; but we managed to head pretty well up to our course, and gradually drew away from Port Hope Light until, as day broke, we had left seven or eight miles behind us. The wind freshened again, and we had a long, tedious beat to windward, with high clay cliffs alongside of us for some ten miles or more, but at last the cliffs broke up and we caught sight of the lighthouse at Newcastle, and the crew being by this time pretty well churned up as to their insides, we ran in for a half-hour's stroll ashore.

Out again at 10 A. M., wind still west, but sea going down and much longer and easier; so we took a long stretch out into the lake in hopes of getting a favoring start, and sure enough, about noon a gleam of pale sunshine came through the leaden clouds, and the wind suddenly chopped round to south-west. Slingsing round on the port tack, we found we could nearly lay our course again, and soon ran up close to Oshawa. Wind heading round again as we closed with the land, so we again tacked and stood out into the lake, with a gradually lightening breeze, until we finally lay almost becalmed six or seven miles out from Whitby, but not for very long. A bright streak appeared along the northern horizon, presaging wind from that quarter, and presently it came, gently at first, but gradually strengthening and freeing, until we were not only able to lay our course, but to head inside of it, and then to start sheets a little, and bowling along past Frenchman's Bay in smooth water, we brought up under a weather shore at Port Union at 6 P. M., and sent a man ashore in the dinghy for the day's papers, warning him not be long, as our course to Toronto lay close under the towering cliffs of Scarboro', and we did not want to be knocked down by an offshore puff in the dark.

Off again in fifteen minutes with the north wind piping up now in good earnest, and the skipper had to interrupt the preparations for supper by calling for a double reef in the mainsail. This was quickly got in, and then commenced a very lively race along shore, with furious puffs coming out of each ravine in the bluffs. The water boiling and seething along the lee scuppers, and the little 8ft. dinghy fairly "standing on her hindlegs," as our ship's doctor put it. We were making, according to actual timing, eight miles an hour, and this is no bad speed for a boat of 19ft. waterline, and altogether too fast for the dinghy; but the painter held, and in a marvelously short time the bluffs began to give way to the wooded slopes of Victoria Park, and these again to low land, dotted with houses, and now beginning to twinkle with electric lights; and before we knew what we were about we had run up abreast of the red light at the Eastern Gap of Toronto Harbor. So quickly, in fact, that the skipper refused to believe in it, and stood on westward for a mile or more, until the great revolving eye of Gibraltar Point warned him that he had passed the entrance. Putting about we went back again, and beating through between the piers, were soon inside the bay, and in a few minutes more had secured a fine berth for the night at the town club house of the Royal Canadian Yacht Club. We had intended standing over to Port Dalhousie, but the lowering of both barometer and thermometer promising a dead run onto an (to us) unknown lee shore in a dark night, and freezing temperature, induced the skipper to make a port for the night; he had been at the tiller since 2:30 A. M. almost without intermission, so perhaps the decision was pardonable, although, as afterward turned out, four or five hours' sailing would have put us twenty-four hours ahead.

The skipper turned out at 6:30 next morning, and found a lowering gray sky with a piping northeast wind, which was sending quite a sea rolling up the lake. It was so bitterly cold that no one was anxious to face flying spray, and all hands went below for another hour, but we finally got under way toward 8 o'clock, and ran out through the Western Gap and on past Gibraltar Point with a fresh breeze on the port beam, but no sooner had we made a good offing than the breeze began to die away, and about ten miles out we at last lay becalmed, and to make matters worse, rolling about in the remains of the last night's swell. A calm in midsummer with a blazing sun and a clear sky is a thing to be expected from time to time, but a calm in the beginning of May with a gloomy overcast sky and a low barometer, and with curious, uncanny looking clouds drifting up from the north and west, seemed to presage something, and we found out afterward that on Lake Erie, only fifty or sixty miles from us, but 30ft. higher, there was very nasty weather indeed, with cold

rain and sleet. But for us, we wallowed about on a gently heaving, oily looking surface from noon until sundown and from sundown till nearly dark, and then the sky commenced to clear from the north and west, and stars began to twinkle and sparkle, and a streak of silvery moonlight appeared on our port bow, and best of all, there came a gentle air on the starboard beam, and the uneasy heaving and rolling gave way to a rhythmic bowing.

The dinghy's painter stretched out, and a little wrinkling appeared under its bows, then the air became a light breeze, and the light breeze a fresh one, hauling round to the starboard quarter, and by 10 P. M. we were bowling along with the spinnaker set and Port Dalhousie and the lights of St. Catharines were winking and twinkling at us over the bowsprit, while those of Toronto were gradually dropping into the lake astern. So numerous were the lights ahead that we had some difficulty in picking up the right ones, but as we got close under the land the St. Catharines lights dropped out of sight and the lookout easily made out the double light of the harbor, and all too soon (for the air had grown milder and the sailing was most enjoyable) we slid in between the piers and into the moonlit basin of the Welland Canal.

The skipper acknowledges to being a lazy man, but when he once gets going under favorable conditions he likes to keep going, and the conditions on this particular night were eminently favorable for the passage of the canal, and the day having been such a tedious one, and the run only thirty miles in all, it seemed a pity to lose the time tied up alongside a pier, so he proceeded up to the canal office and obtained the necessary pass, and Zulu was towed into the first lock, and the great gates swung to behind her. Then came a rush of mighty water as the valves in the upper gate were opened and in another minute we were slowly rising, rising out of the

ZULU.

Designed and built by H. K. Wicksteed.

dark lock pit into the glare of the electric lights. Then the upper gates swung apart, and with a long, light tow line and a man at the end of it, Zulu glided out onto the next level and into the lock above. Again and again the process was repeated, and meantime day broke, and then the sun came up in a cloudless sky, and still Zulu kept rising higher and higher and penetrating further and further inland. The crew showed signs of weariness and insubordination, and were presently sent below for a nap, while a canal tramp was brought into service on the end of the tow line. Passing St. Catharines, we reached about 9 o'clock the foot of the Niagara escarpment, and now the locks came thick and fast, and as we rose higher, ever higher, we had a magnificent view over the level country we had just traversed, and the blue plain of Lake Ontario beyond, stretching away beyond to the horizon. By noon we had cleared the twenty-sixth and last lock, and floated on the level of Lake Erie, 330ft. above Ontario, and the crew heaved a sigh of relief in content, and feeling their sore and blistered hands, vowed they did not want any more canaling.

[TO BE CONCLUDED.]

The America Cup.

THE following interview with Mr. C. Oliver Iselin, the manager of the Cup defense, by Mr. W. E. Robinson, of the Boston Globe, is reliable, and so far as it goes more important than the numerous unverified reports in daily circulation:

C. Oliver Iselin, managing owner of Defender and of the new defender now building by the Herreshoffs, paid one of his flying visits to Bristol on Jan. 31, arriving from Providence on the 12:19 train, and leaving on the 3:50. His visit was for a look at the recently cast lead keel of the new boat as well as to see how the work in general was progressing.

To inquiring newspaper men he was as chary as ever of giving any information as to the dimensions or construction of the new boat, although to the Globe's yachting man, who was his seat-mate on the return trip to Providence, he talked with considerable freedom on matters that did not touch the vital features of the latest Herreshoff design.

Asked directly for the material of which the new boat was being built, Mr. Iselin declined firmly but politely to give information on that or on similar points.

"I put my refusal," he said, "solely on the ground that I do not think it best to tell the people on the other side of the water just what we are doing. We know very little as yet of what their boat is to be, and there is no reason why we should give them any advantage by telling our plans."

"But several things already are known about the new boat, and have been made public."

"Very true," replied Mr. Iselin, "but there are many other things that are not known, as well as many published things that are evidently guesses. Whether the public believes the published statements I cannot say, but if I should give information it would at once acquire an official character, and be accepted as correct. No, I think it best not to give any information."

"Not even as to material?"

"No, not even that."

"Yet the material will be known as it reaches the works and as the construction of the boat progresses, will it not?"

"Probably," was Mr. Iselin's reply, "but by that time we expect that Shamrock will be so far along that the knowledge will not matter so far as any effect on her construction goes. Dimensions? I shall never give the dimensions of the new boat for publication with exactness any more than I did those of Defender. I have no doubt you newspaper men will get them sufficiently close for all non-technical purposes, but I hold that exact dimensions, provided you get a fast boat, give an opponent too much of an advantage to improve in any boat that may subsequently be built."

"You expect a decided improvement in the new boat?"

"Yes, we do, but Defender is a hard boat to beat. Very few people really knew how fast she was in 1895, and she ought to be as fast as ever now that she has been put in good condition."

"You have definitely decided on skipper and crew?"

"Yes; Capt. Charlie Barr will sail the new boat, and will have a crew of fifty men from Deer Isle, Me., under him. They already have been engaged. About half of them were of Defender's crew, and so will be familiar with their work at the start."

"The skipper for Defender has not been selected, nor the crew, but we shall find some good man to sail her. Our present intention is to man her with a Norwegian crew, picked from the best men among the yacht sailors of that nationality, and let the two crews stack up against each other and see which is the smarter."

"Yes, the racing of the boats against each other will be of great use in getting the new boat into proper trim. Practice sailing alone never will get a boat into such good shape as close racing. Vigilant was a great help to Defender in 1895 in that line."

"Is it a fair presumption that a steel boom and a steel gaff will be in favor in '98 as in '95?" was asked.

"Yes, they are still in favor. Defender's steel boom was very stiff and strong, and her steel gaff was carried in all her later racing. It was not until we found that the gaff could be depended upon that we made the steel boom, but both did excellent service."

"A steel mast is a different thing. I do not know that any experiments looking to the practicability of a steel mast have been made."

"How about sails, Mr. Iselin?"

"I hope that we shall have better sails than ever before in a cup contest. The Englishmen have rather beaten us heretofore on sails, in looks anyway, but this time I believe we can match them. The great trouble with our sails previously has been the uneven stretching of the duck, due undoubtedly to something in the weaving. Now, however, we believe we have something that, with improvement in both yarn and weaving, will do away with much of the previous trouble."

"The duck has been woven specially for us, and the sails themselves will be made by the Herreshoffs in their new loft on Burnside street."

"How did you find matters at the works?"

"Everything is going smoothly. That lead keel is a fine casting. How much lead in it? Now that is forbidden ground, or whether it is more or less than in Defender's. Given the power and sail plan of a man's boat, and you come pretty close to the boat herself. I had rather know a man's sail plan than anything else about his boat."

"American experience has shown that the boat that can carry the most canvas, and carry it properly, usually wins. We started out with a 100ft. boom on Defender. Then when we found Valkyrie III. had one 105ft. in length we gave Defender one to match it, believing that she was powerful enough to carry it. Her racing proved the correctness of our belief."

"The new boat's model? Oh, that question is in the same class as those about material, but I expect that Herreshoff will give us a good reaching boat, better even than Defender or Vigilant. You know we get plenty of reaching on the triangular courses, and a boat needs to be fast there as elsewhere."

Speaking of Valkyrie III. as a possible "trial horse" for Shamrock, Mr. Iselin expressed the hope that Sir Thomas Lipton might have her or some other fast boat to race against before crossing the Atlantic, both for "tuning up" and to see how fast a boat the Shamrock really would turn out to be.

Mr. Iselin had no opinion to express as to the probable outcome of the Cup races, but there is no question but that he is as much in earnest in keeping the Cup on this side as he was in 1895, and that he and the yachtsmen who are interested with him in Cup defense will leave nothing undone that can contribute to success.

The name of the new boat will not be decided upon until the return of Com. J. Pierpont Morgan from Europe.

In the meantime the work on the new boat is being pushed at the Herreshoff Works. The top of the lead keel is being smoothed and fitted for the placing of the bronze keel plate, while the steel frames are being bent and made ready for setting up as soon as keel, stem and sternposts shall have been put in place.

Not long ago the Globe said on what was presumably good authority that W. K. Vanderbilt was bearing the expense of fitting out and repairing Defender. The information was not correct. Mr. Vanderbilt and ex-Com. E. D. Morgan, owners of Defender with Mr. Iselin, have turned the boat over to Mr. Iselin and Com. J. Pierpont Morgan to use as they please. These last named men are the only ones financially interested in the new boat.

Although Mr. Iselin, in talking about the new boat, declined to give detailed facts and figures, there is no reason to change the opinion already expressed as to

* The lines of Zulu were published in the FOREST AND STREAM of Dec. 10, 1898.

what she will prove to be when many more things are known about her than at present.

The Globe already has outlined her as a more powerful and lightly constructed boat than Defender, with such modifications in the latter's model as would make the new boat faster in reaching and down the wind with spinnaker set, while at the same time losing none of Defender's "wind-jamming" qualities. An "improved Defender," with certainly no smaller sail plan, and probably as large a one as can be made to stay in place.

Oregon pine mast, spruce topmast and bowsprit and steel gaff and boom can now also be added, with working sails of an improved weave of cotton duck and the latest ideas in silk and linen for the light sails.

Since Mr. Iselin declines to affirm or deny the truth of the many stories as to bronze or other plating which have come out since the Globe said nickel steel, the information on which the last named material was predicted is apparently as good as ever.

The Seawanhaka Cup.

THE Seawanhaka international challenge cup for small yachts remains in the custody of the Royal St. Lawrence Y. C., of Montreal, Canada, the last match therefor having been won by Dominion against Challenger at Montreal in August last.

The Seawanhaka Corinthian Y. C. has challenged for a match in the season of 1899, and the challenge has been accepted for the 20ft. class, Seawanhaka measurement; the match will be sailed on the waters of Lake St. Louis, near Montreal, at a date hereafter to be announced.

The Seawanhaka Club in this third effort to regain the cup earnestly invites from other yacht clubs of the United States the co-operation which for the last four seasons has been so generously given, and therefore proposes to hold open trial races for the purpose of selecting its representative yacht on July 8, 10 and 11, 1899.

For the information of any who may be interested in the subject, and especially for the guidance of those who may contemplate making entries in the trial races, the race committee announces the following general conditions governing the cup, which are extracts from the declaration of trust executed by the Seawanhaka Club, and the following general regulations for the control of the match, which have been agreed upon with the challenged club.

[These conditions are the same as previously published in connection with former matches.]

General Regulations Governing the Match for 1899, Between the Representative Yachts of the Royal St. Lawrence Y. C., of Montreal, Holder of the Cup, and the Seawanhaka Corinthian Y. C., of New York, Challenger.

The challenging and challenged clubs desire, as far as possible under the existing measurement rule, to prevent the extreme development of the more objectionable features of form, evident in yachts heretofore constructed with reference to competitions for the challenge cup, and to this end have agreed upon certain restrictions, embodied in Article IX., following, to which attention is specially directed.

Article I.—The courses shall consist of a triangular course and a course to windward and leeward and return. Each leg of the triangular course shall be one and one-third nautical miles in length, and shall be sailed over three times, making a total of twelve miles. The course to windward and leeward and return shall be two nautical miles to each leg, and shall be sailed over three times, making a total of twelve miles.

Article II.—The start shall be a one-gun flying start, with a preparatory signal.

Article III.—The races shall be sailed without time allowance.

Article IV.—Yachts must not exceed 20ft. racing length (S. C. Y. C. measurement).

The formula for determining racing length under the S. C. Y. C. rules is as follows:

$$\frac{L.W.L. + \sqrt{\text{Sail Area}}}{2} = \text{Racing Length.}$$

Article V.—A yacht's draft of hull or keel shall not exceed 5ft., and with the centerboard down shall not exceed 6ft. Draft shall be determined when yachts are in trim for measurement. Centerboards shall be so constructed that they can be wholly housed without leaving any projection below the hull or keel.

Article VI.—Yachts shall be measured without crew on board, but instead thereof a dead weight of 450 lbs. shall be carried amidships, approximately at the center of buoyancy, during measurement. The total actual weight of the crew, including all clothes, personal apparel and belongings worn by them or carried on board during any race, shall not exceed 600lbs.

Article VII.—Shifting ballast shall not be allowed. (Weighted centerboards shall be considered as fixed ballast.)

Article VIII.—No outrigger or other mechanical device for carrying live ballast outboard shall be allowed.

Article IX.—The overall length must not exceed 32ft. 6in. The deck plan must show a fair curve from transom to stem, and the sides of the deck or gunwales must meet together at the stem, which must be on the longitudinal center line of the vessel. The angle between the gunwales and longitudinal center line of the vessel at the stem must not exceed 35 degrees.

Article X.—The factor of sail area, used in determining racing length, shall be ascertained by adding to the actual area of the mainsail, computed from its exact dimensions, the area of the fore triangle. The hoist of the mainsail, when measured, shall be plainly marked on the mast, and its outer points on the boom and gaff or other spars used to set the sail, and the sail shall not be set beyond these limiting points. The fore triangle shall be determined by the following factors: (1) The perpendicular shall be the perpendicular distance between the deck and a point on the forestay, above which the jib shall not be hoisted. (2) The base shall be the distance between the forward side of the mast at the deck and the point of intersection of the forestay with the bowsprit or hull.

Any jib, when set, must not extend beyond the upper and forward points above defined.

Sails shall be limited to mainsail, jibs and spinnaker.

The total area of the mainsail and fore triangle shall not exceed 500 sq. ft. The area of the mainsail alone shall not exceed 80 per cent. of the total area. The area of the spinnaker, measured as a triangle, whose base is the length of the spinnaker boom measured from its out end, when set, to the center of the mast, and whose perpendicular is the distance from the deck at the foreside of the mast to the spinnaker halyard block, shall not exceed twice the area of the fore triangle.

Article XI.—The spinnaker boom, when used in carrying sail, shall not be lashed to the bowsprit or stemhead.

Article XII.—The helmsman or helmsmen and crew shall be amateurs, and the total number of persons on board shall be limited to four. The helmsman may be changed at will, and as often as may be desired in any race, provided that such helmsmen shall have been named in writing, as required by the provisions of Article X. of the Declaration of Trust.

The trial races for the election of a challenger will be held at Oyster Bay, July 8, 10 and 11, 1899, under the same conditions as in former years.

Special Conditions.

(1) The yacht selected to represent the club shall be the one which, in the judgment of the race committee, shall be the best adapted therefor, and not necessarily the winner of a majority of the trial races. The committee will exclude from competition any yacht possessing peculiar or "freak" features, which in its judgment are objectionable and unfair. Additional races may be ordered by the committee between such contestants as they may select.

(2) The owner of each yacht entering for the trial races must on or before July 6, 1899, furnish to the secretary of the committee the racing measurement of his yacht, certified by the measurer of the Seawanhaka Club.

(3) Each yacht must carry a racing number, fastened securely on both sides of the mainsail.

(4) In the event of any race being postponed or ordered resailed, it will be sailed at as early a date as may be practicable.

Entries.

All entries for the trial races must be made by the clubs to which the owners of the respective yachts entered belong. Clubs intending to make entries are requested to notify the secretary of the race committee, and will be furnished with printed or written blanks, upon or in accordance with which entries must be made, and at the request and upon the responsibility of any club entering a yacht to compete in the trial races, all the privileges of the club house at Oyster Bay will be extended to the owners and amateur crew of the yacht so entered during the period occupied by the said races, upon the same terms as to members of the club.

Race committee:

CHARLES W. WETMORE, Chairman,
30 Broad Street, New York.
WALTER C. KERR,
26 Cortlandt Street, New York.
CLINTON H. CRANE,
Exchange Court Building, New York.
JOHNSTON DEFOREST,
7 North Washington Square, New York.
CHARLES A. SHERMAN, Secretary,
64 Leonard Street, New York.

YACHTING NEWS NOTES.

Mr. H. C. Wintringham has designed a c. b. schooner for E. A. Morrison, which will be built by Joseph Thomas & Sons, Baltimore. She will be 70ft. over all, 48ft. l.w.l., 16ft. 8in. beam, and 7ft. draft of hull. She will be christened Lucille.

The Riverside Y. C. held its annual meeting on Feb. 3 at the Arena, New York, with Com. Tyson in the chair. The following officers were elected: Com., Geo. G. Tyson; Vice-Com., I. A. Hopper; Rear-Com., Charles T. Pierce; Treas., C. F. Buxton; Sec'y, John G. Porter; Meas., E. Frank Lockwood; Trustees for term ending Feb., 1902, O. R. Houghton, George Lowther; Trustees for one year, Frederick Beltz, W. J. L. Davids; Regatta Committee, Edward Binney, George B. Clark, W. A. Huffington; Membership Committee, Robert Rutter, W. J. Worrell, I. H. McKenna; Entertainment Committee, J. Arthur Oatwell, H. F. Whitmore, W. I. Sanger; Chaplains, the Rev. George C. Houghton, D. D.; the Rev. Rufus S. Putney, the Rev. Charles W. Boylston; Fleet Surgeon, Dr. H. H. Tyson, Jr.; Delegates to Sound Y. R. A., C. T. Pierce and Edward Binney. A proposal to lower the dues was not adopted. Messrs. Pierce, Binney and Jones were appointed a special committee to charter a steamer to follow the America Cup races next fall. Mr. Pierce was also delegated to report on the subject of a town club for yachtsmen. The club has a membership of 175.

The Corinthian Y. C., of San Francisco, held its annual meeting on Jan. 25, electing the following officers: Com., Carl Westerfeld; Vice-Com., W. H. Toepke; Port Captain, J. H. Keefe; Directors, T. L. Miller, C. L. Barrett, E. F. Sagar, and A. I. Lyons; Regatta Committee, J. H. Hopps, T. J. Kavanaugh and Douglas Erskine. The club has a membership of 168, with a fleet of thirty-three sloops, nine yawls, one schooner and five launches.

NOTICE TO SUBSCRIBERS.

The address label on the wrapper shows the date of the close of the term for which the subscription is paid. The receipt of the paper with such dated address label constitutes the subscriber's receipt for money sent to us.

Subscribers are asked to note on the wrapper the date of expiration of subscription; and to remit promptly for renewal, that delays may be avoided.

For prospectus and advertising rates see page iii.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday and as much earlier as practicable.

The Spalding St. Lawrence Boat Co. is building a keel sloop of 36ft. over all, 25ft. l.w.l., 9ft. beam, from designs by C. H. Crane. She will be double-skin, with mahogany outside. Messrs. C. H. and H. M. Crane will race her on the Sound next summer.

The annual meeting of the New York Yacht Racing Association was announced for Feb. 1, but was not held, as no quorum was present.

Alcedo II., steam yacht, G. W. C. Drexel, sailed last week from Philadelphia for Savannah, where Mr. and Mrs. Drexel, Miss Clementine Irick, Mr. Livingstone L. Biddle, Mr. Craig Biddle, Mr. Francis William Rawle and Dr. C. M. Merrill, of Jacksonville, will join her for a cruise to Porto Rico and other West Indian ports.

May, steam yacht, Com. Alex. Van Rensselaer, Cor. Y. C. of Philadelphia, will sail about Feb. 15 on a cruise to the West Indies.

Coronet, schr., F. S. Pearson, sailed from Santiago for Kingston on Jan. 24. After her return to New York she will refit for a cruise to Greenland and Iceland.

Narwhal, steam yacht, No. 1 of the name, has been sold by C. H. Osgood to Edgar Harding, of Boston, who will change her name.

The Gravesend Bay Y. C. held its annual meeting on Feb. 1 at the club house, Bath Beach, with Com. Sherwood in the chair. The following officers were elected: Com., Robert H. Sherwood; Vice-Com., Edward P. Morse; Rear-Com., W. C. Bolton; Meas., Richard W. Rummel; Fleet Surgeon, Dr. George G. Cochran; Prest., Cornelius Furgueson, Jr.; Vice-Prests., George B. Waters, Thomas Cleary; Treas., Henry W. Pfalzgraf; Cor. Sec'y, James W. Wakelee; Trustees, Dr. John E. De Mund, Dr. John A. Voorhees, James E. Bale, N. C. Corey, R. Hudson Riley, Thomas J. Hamilton, William G. Morrissey, William J. Berg, Frederick Petze, Gilbert Nelson, Albert Van Brunt Voorhees and Mortimer Van Brunt.

The magnificent American steam yacht Nahma, 1,806 tons, belonging to Mr. Robert Goelet, New York, left Gourock this forenoon for Gibraltar. The Nahma is now under the command of Capt. George Harvey, who was for two years master of the American steam yacht Andria (Mr. John E. Brooks). His crew consists of about seventy, all told. The first, second and third officers and seamen are all English, while the engineers, stewards and firemen are all Scotsmen. On the passage to the Rock the Nahma will not be driven at her full speed—sixteen and three-quarter knots—but at twelve knots an hour, at which rate, should she get favorable weather, she will reach Gibraltar by Thursday. The designer of the vessel, Mr. G. L. Watson, went down the Firth to-day in her as far as Largs, where he was landed. The Nahma will complete her fitting out at Gibraltar, and will be joined there toward the end of next month by Mr. and Mrs. Goelet and party, after which she will make an extended cruise in the Mediterranean, returning to the Clyde next July.—New York Herald, European Edition, Jan. 21.

The 1899 catalogue of C. P. Willard & Co., yacht, launch and engine builders, of Chicago, lists a very extensive line of steam engines and boilers, naphtha engines, yachts, launches, etc. The catalogue is fully illustrated.

Canoeing.

W. C. A. Midwinter Meeting.

[The secretary of the W. C. A. has prepared the appended report of the midwinter meet of that body, to which is added the general address to the members advocating the embodiment of the W. C. A. into the wider and older organization, the A. C. A., but with the reservation of provision for a Western division of the A. C. A.]

MILWAUKEE, Wis., Jan. 25.—The Western Canoe Association, Office of Secretary-Treasurer: Greeting to Members: On the 21st of this month the executive committee of this association held its regular midwinter meeting in Milwaukee, in pursuance to the call issued by the secretary and arrangements made at the special meeting of the committee held at Chicago last November.

There were present all members of the committee excepting two, several other association members; the commodore and the vice-commodore of the Central Division of the American Canoe Association. The usual informal open meeting and discussion were held previous to the business meeting of the committee, and all open matters of interest to the association were talked over, after which the committee went into executive session.

The secretary-treasurer's report showed that the association was now in position to pay its indebtedness of record, and he was instructed to do so. The returns from the circular letter sent out last November, setting forth the proposed movement of this association to join the American Canoe Association, were most gratifying, and left to your committee but one course to pursue. Every person heard from, except one, voted in favor of this move, and in accordance with this almost unanimous sentiment the following resolution was adopted:

"Resolved, That the secretary is hereby instructed to make application for membership to the American Canoe Association on behalf of our association, and such membership be made to constitute a Western Division of the A. C. A. And said division to include as its territory the States of Ohio, Indiana, Michigan, Illinois, Wisconsin, Iowa and Minnesota. And that our secretary-treasurer is authorized to hold in trust all money received from members for this purpose."

In view of the above action it was voted to omit the publication of the "Year Book" and to abandon the summer W. C. A. meet.

Three changes in officers were made pending the final

IN NEW JERSEY.

South Side Gun Club.

Newark, N. J., Jan. 28.—The target shoot of the South Side Gun Club resulted as shown by the scores below. The three-men team race was as follows: Feigenspan 20, Dukcs 18, Dawson 17; total 57.

Terrill 18, Smith 17, Babbage 16; total 51.

Trap at Lyndhurst.

Lyndhurst, N. J., Jan. 31.—The match between Messrs. Dunkerly and Heflich was under unfavorable weather conditions, a light snow falling. There was little wind. The birds were a good lot. A match was shot between Messrs. Lee and Wolf, 10 birds, \$5 a side, the latter winning. A sweepstake also was shot. The scores:

T Dunkerly	2*212211221201121212021—22

Tie for cup, 5 birds:
Moffett, 27

Annie Oakley Against Good Birds.

Singac, Feb. 2.—Miss Oakley undertook to kill 40 out of 50 of Bunn's birds, and succeeded in gathering 37. But she should have had one more at least, as the dog drove one out about a yard and it came back and dropped dead. Miss Oakley was balked on five occasions, the trap puller being unable to hear her call "Pull" on account of the distance from her and her light voice. She had two sisters, and along with the five mentioned above she lost the 7th, which seems to me to be her weak spot in shooting. The birds were a good, fair lot, and with a little wind they would have been as good and fast as ever trapped anywhere. Miss Oakley hit every bird she shot at, but she did not seem to center her birds as she usually does. She remarked to the writer of this after the shoot that if any one thought it was such an easy matter to kill 40 out of 50 of such birds as Bunn furnished to-day he could get \$50 of her money any day. The weather was fine—no wind. There was a very large crowd. There was a 10-bird sweep, \$5, and a 7-bird, \$3. Jim Smith was referee. W. Dutcher scorer.

The very fast birds were the 4th, 10th, 12th, 13th, 20th, 33th, 43d, 44th, 48th and 49th.

The scores:

Hackensack River Gun Club.

Hoboken, N. J., Feb. 3.—The scores made at the Hackensack River Gun Club shoot on its grounds at Heflich's Hotel to-day are as follows. No. 1 was really two events; the first, at 10 birds, was the postponed January club shoot, and the second, 10 birds, was the February club shoot. No. 2 was a sweepstake race.

Wm. Hexamer won the club's medal for '98, he having the highest average in both live-bird and clay-bird events for that year:

No. 1, 20 birds.	No. 2, 5 birds.
Wm. Hexamer	2221120*01220220022—14
H Kramer	2*11*12101012112022—15
H Stuhler	122*21212w

Belvidere Gun Club.

Belvidere, N. J., Feb. 4.—The second shoot of the Belvidere Gun Club at targets was held on Jan. 27, on the club grounds. The bad weather lessened the attendance. The scores were: Smith 23, H. Heffee 6, H. Searles 22, W. Smith 18, C. Rosebery 26, J. Keffer 11, J. Beers 7, Ousley 12, P. Eilenberg 4.

The scores at the fourth regular shoot at targets on Feb. 4 were as follows:
W. Rainer 29, L. Smith 19, H. Heffee 20, H. Brink 23, W. Smith 9,

G. Lattemann 29, P. Hess 9, H. Bordman 8, J. Bordman 7, F. Buckmeyer 5, Tiffany 4.

G. LATTEMAN, JR.

Trap at Yardville.

Yardville, N. J., Feb. 1.—The 25 live-bird race, shot on C. Zwirlein's grounds, Yardville, N. J., had fifteen entries, and was well contested. Zwirlein captured first money on a score of 21. Money, Warford and Cubberly divided second on 23 kills, while J. R. Hull, Widman and Stotts divided third on 22. The conditions were 25 live birds, \$10 entrance, birds extra at 25 cents. A \$2 miss-and-out was shot before the main event, in which Miss Oakley and Messrs. Money, Elliott, Hull, Koegel, Budd, Warford, Cubberly and Zwirlein participated, Elliott and Koegel dividing on the 6th round. The score:

Capt. A. W. Money Defeats J. Rothacker.

Yardville, N. J.—Capt. Money has apparently quite recovered from the attack of grip that has been bothering him all the winter. He is back "in his usual good form" again. On Friday last, Feb. 3, he shot a match at Zwirlein's grounds, Yardville, N. J., with John Rothacker, of Philadelphia. The Captain was conceding Rothacker 4yds., standing at 30yds. to Rothacker's 26. The conditions were 100 pigeons per man. Capt. Money started off in a manner that was calculated to break anybody's heart. He ran his first 50 straight, then slipping up on his 51st bird. He lost another bird in the 80th round, his score at the end of the 90th round standing 88 out of 90. Then his gun went back on him. He was shooting his Greener, the crossbolt of which gave out when he had fired at his 90th pigeon. He had great difficulty in opening the gun after each successive shot, the worry causing him to lose two more birds out his last 10. A curious feature was the fact that when he had fired at and killed his 100th bird in the match, the gun closed absolutely and refused to be opened. It had done its work, and did not relax its grip until J. P. Deneffeler got to work on it on Saturday morning. The full scores of the match were: Money 96, Rothacker 85. Capt. Money's "50 straight" and his score of 96 out of 100 are both new records for Zwirlein's grounds. He shot his usual load of 50grs. of E. C. and 1½oz. of 7s in Trap shells. Rothacker shot 3½drs. of Schultze, 1½oz. of shot in a Leader shell. The match commenced at 1:32 and ended at 3:53. Capt. Money won the toss and elected to go to the score. The scores, flights, traps, etc., are given below:

New Jersey Championship.

Lyndhurst, N. J., Feb. 4.—There was a fine attendance at Tom Morley's shoot, the main event of which was the E. C. cup contest for the championship of New Jersey, between Mr. Morley and Capt. A. W. Money, the former winning by the excellent score of 47. There was a large crowd in attendance. The day was dark, and therefore there was a bad light for target shooting. The background too, made up of trees, an old barn and other bits of festooning around the outskirts, made difficult shooting, particularly as the targets flew at a merry speed and at numerous angles of rare intricacy. Mr. Morley's score is remarkably good. It is doubtful if any one could excel it under the same conditions. Capt. Money's score is really good under the circumstances, as will be more clearly perceived by comparing it with the scores of some of those of the good class men, made in the sweepstakes. Mr. Lewis Harrison was referee. The scores:

The E. C. cup contest:	
T W Morley	01111 11111 11111 11111 11111—24
A W Money	11111 11011 11011 11111 11011—23
	10101 01111 10111 11111 11111—21-44

Eastern and Western Shooters.

CHICAGO, Jan. 28.—Editor Forest and Stream: I read in the columns of the FOREST AND STREAM, under date of Jan. 14, an item under the caption of "Eastern and Western Shooters," which makes reference to sectionalism, etc., in connection with the Grand American Handicap, and have also read several letters published in a Chicago journal giving views of writers on the subject of money divisions, some with an acrimonious spirit.

I believe in the broad-gauge principle or plan, which shows enlightenment, and can safely say, I think, that there is no sectionalism in the shooting fraternity of the United States of America, be it North, East, South or West, and there should be none.

That there is raspy feeling now and then, evidenced by an Eastern sportsman as against the Westerner generally, I think no one can deny, when they read the letter of the Portland man recently published in the Chicago journal aforementioned; also, one from Franklin, Pa. These two gentlemen took occasion, I believe, to tell the Westerner to "play in his own yard," if they didn't like the appearance of other yards, at the same time intimating that, finding himself broke in the East, the spring roads would be good and he could walk home.

This was doubtless all in good part or intended as a joke, but nevertheless evidences a little feeling.

I have never had the good fortune to attend the Grand American Handicap, but hope to this year; still I have read much of the published matter relating to it. It came to my knowledge through the shooters who attended in 1897 and 1898, and who will doubtless recollect that their Eastern brethren had something to say, and not altogether kindly, about a team race between the East and West, which was the first talk that in any particular squinted at the existence of sectional feeling.

Again, in 1898 at least a dozen gentlemen from New York and Pennsylvania sought and urged an individual contest between an Eastern and Western gentleman, in various ways displaying a seeming ambition to "do" the Westerner or make him feel uncomfortable.

While I have not been in the division of the moneys in the Grand American Handicap events, I am none the less greatly pleased that the matter is permanently settled, at least for this year's event, with a Westerner on the handicap committee, and with perfect satisfaction to the majority of the shooters of the country, I believe.

The nonsense accredited to the Times-Herald, of Chicago, and deplored by the FOREST AND STREAM, is not chargeable to any one but a local reporter, whose knowledge of shooting matters is not a pride to himself or any one else. He is at least a learner, however, and if in his writings a little inclined to encourage sectionalism it is, I am informed, because of a training for which he thanks the sporting and athletic interests of the East.

It is pleasing to know that the increased number of moneys decided upon by the Interstate Association was not demanded alone by the West, but by the North, East, South and West alike. The demand for class shooting was due entirely to the efforts of one gentleman, and he an Easterner, though he failed to present petitions probably.

The system of high guns as decided upon is satisfactory, and while it is true that, whether the 23s get into the money or not depends on how many shooters shall be able to kill 25 and 24, the possibilities of the 22s and 23s are certainly good, and the least said by any of the papers or anybody else the better is liable to be the attendance at the Grand American Handicap of 1899, at least from a distance.

The Times-Herald has endeavored to encourage shooting and other clean sports, and is ever ready to give space and kindly notes from time to time; and while its reporters have, perforce, written of matters on which they were not fully advised, as on football, baseball and golf, they were honest as to intention, and their work is appreciated by sportsmen generally who read the paper. Even some sporting papers publish reports of the Times-Herald, which are received through the press-clipping bureau.

Let us have nothing but union of action and harmony of thought, each and every one working together unselfishly, understandingly, without prejudice, and with honest endeavor to further the shooting interest, which is the greatest civilized sport afforded us near our homes.

It is always necessary for some one to lend aid in the management of shooting clubs, arranging for tournaments, managing shoots, etc., who are the hustlers and get little but glory out of it. It is always easy to find fault with the acts of others, but now that we are started right, let every shooter feel it obligatory on his part to put his shoulder to the wheel and assist in making the Grand American Handicap of 1899 the greatest success of the shooting fraternity of the United States since the birth of the Grand American Handicap.

From my observation, and from information received through inquiry, I am fully convinced that the Western attendance to the Grand American Handicap will reach close on to the hundred, mark, and make their presence known by their gentlemanly conduct and good shooting.

A. C. PATERSON.

[While Mr. Paterson's letter purports to be from a broad-gauge standpoint, it has a decidedly provincial tone in some specific points, and a few contradictions. As evidence of a "raspy feeling" of an Eastern sportsman against the West generally, he cites vaguely a letter of a sportsman of Portland, Me., "also one from Franklin, Pa." which sum up two Eastern sportsmen, and who took occasion to tell the Westerner to "play in his own yard" if they didn't like

ON LONG ISLAND.

Thursday of this week is the date fixed upon for the contest between Dr. E. S. Carroll and Mr. E. C. Burkhardt, at Audubon Park, Buffalo, N. Y., for the Clinton Bidwell challenge trophy.

Interstate Association Rules.

The rules of the Interstate Association governing target and live-bird shooting are as follows:

Targets.

RULE 1.—REFEREE AND JUDGES.

Two judges and a referee, or a referee alone, shall be selected by the management or by the contestants in a match, whose decision shall be final.

RULE 2.—DUTIES OF THE REFEREE AND JUDGES.

The judges and referee, or the referee, if acting alone, shall see that the traps are properly set at the beginning of the match and kept in order to the finish. They, or he, shall endeavor to make the flight of the targets conform to the height and direction indicated in Rule 7. They, or he, shall test any trap upon application of a contestant at any time during the match by having a trial target thrown from that trap. They, or he, may at any time, and must do so when so requested by a contestant, select one or more cartridges from those of a shooter at the score and publicly test the same for proper loading. If the cartridge or cartridges are found to be loaded in violation of Rule 11 the shooter shall suffer the penalty imposed by the said rule.

RULE 3.—SCORING.

Section 1. A scorer shall be appointed by the management or by the contestants in a match, and his score thereof shall be the official one. All scores shall be plainly kept, a lost target being indicated by a cipher and a broken target by the figure 1.

Section 2. Whenever possible the score shall be kept on a blackboard, and in plain view of the shooters at the score; and the score thereon shall then be the official score. The score kept on paper for use in the cashier's department shall at all times be made to conform with the score on the blackboard.

RULE 4.—PULLER.

A puller shall be appointed by the management or by the contestants in a match, whose duty it shall be to pull or spring the traps the instant the shooter calls "Pull"; he shall be placed in such a position that he has an unobstructed view of the shooter at the score. Where the pulling is to be done according to an indicator for unknown traps, the puller shall be placed in such a position that the shooter at the score shall have no means of ascertaining by the puller's actions which trap will be sprung.

RULE 5.—PULLING THE TRAPS.

Section 1. The traps may be pulled from right to left or from left to right, as may be decided by the management.

Section 2. If the shooting is from known traps—that is, if a shooter knows which trap shall be sprung for him—he may refuse a target thrown from any other trap, but if he fires the result shall be a "no target," whether broken or missed.

Section 3. If the trap is sprung before or at any noticeable interval after a shooter has called "Pull," he can accept or refuse such target, but if he fires the result shall be scored.

Section 4. In any contest where the shooting is from unknown traps, the parties thereto may select some person who shall be placed by the management in such a position that he is able to see that the traps are sprung in accordance with the number designated by the indicator.

Section 5. When the shooting is from unknown traps, if the puller does not pull in accordance with the numbers designated by the indicator, or by dice (if used), or by any other method ordered by the management, he shall be removed and another substituted. Every target thrown from a trap thus wrongly pulled shall be a "no target," whether broken or lost.

RULE 6.—ARRANGEMENT OF TRAPS.

All matches shall be shot from three or from five traps, and all traps shall be set level and in a segment of a circle or in a straight line. When the traps are set in a segment of a circle, the radius of that circle shall be 16yds. In all cases the shooter's mark shall not be a less distance from each trap than that designated in Rule 9. The traps shall be not less than 3yds. nor more than 5yds. apart. The traps shall be numbered from left to right; that is, No. 1 shall be first trap on the left, and No. 2 the next trap to the right of it, and so on.

RULE 7.—ADJUSTING TRAPS.

Section 1. All traps must be adjusted to throw targets a distance not less than 40yds. nor more than 60yds. If any trap be found to be too weak to throw targets the required distance, a new trap or new spring that will do so must be substituted.

Section 2. The trap shall be so adjusted that the elevation of the target in its flight at a distance of 10yds. from the trap shall be not more than 12ft. nor less than 6ft.

Section 3. When shooting at known angles, the direction of the flight of the targets from each trap shall be: If only three traps are used, No. 1 shall throw a left-quartering target; No. 2 shall throw a straightaway target; No. 3 shall throw a right-quartering target. The angles of Nos. 1 and 3 shall be the same as those prescribed for Nos. 2 and 4, where five traps are used. If five traps are used, No. 1 trap shall throw a right-quartering target; No. 2 shall throw a left-quartering target; No. 3 shall throw a straightaway target; No. 4 shall throw a right-quartering target; No. 5 shall throw a left-quartering target. Traps Nos. 1 and 5 shall be adjusted to throw the targets so that their line of flight shall cross that of the straightaway target at a point not less than 10yds. nor more than 20yds. from No. 3. No. 2 shall be adjusted to throw targets so that their line of flight shall cross the line of targets thrown from No. 1 at a point not less than 5yds. nor more than 10yds. from No. 1. No. 4 shall be adjusted to throw targets so that their line of flight shall cross the line of targets thrown from No. 5 at a point not less than 5yds. nor more than 10yds. from No. 5.

Section 4.—After the traps have been adjusted to throw targets at the above angles, if the target for any reason shall take an entirely different course, it shall be declared a "no target," provided the shooter does not fire at it; but if he fires, the result must be scored. By an "entirely different course" is to be understood as follows: If the target ought to be a left-quarter, and it has any left-quartering tendency, it shall be considered a fair target; if the target ought to be a right-quarter, and it has any right-quartering tendency, it shall be considered a fair target; a straightaway may vary 45 degrees on each side of its correct flight. If, in the opinion of the referee, the target has taken "an entirely different course," that is to say, if it has gone outside of the above limits, he shall allow the shooter, provided he has not fired, another target from the same trap, if the shooting is from known traps; if from unknown traps, the shooter shall be given another target from a trap designated in the manner set forth in Rule 17, Section 3, when a target breaks in the trap when the shooting is under "expert rules."

RULE 8.—SCREENS.

Pits or screens, or both, may be used to hide the traps and trappers, but the screen should not be higher than is actually necessary to protect the trappers.

RULE 9.—THE RISE.

In single target shooting the rise shall be 16yds. for all guns. In double target shooting the rise shall be 14yds. for all guns.

RULE 10.—CALIBER AND WEIGHT OF GUN.

No gun of any caliber larger than a 10-bore shall be used. Weight of gun unlimited.

RULE 11.—LOADS.

The charge of powder is unlimited. The charge of shot shall not exceed 1½oz., any standard measure, struck. Any shooter using a larger quantity of shot shall forfeit his entrance money and right in the match. If, however, the management is of the opinion that the shooter has not willfully violated this rule, it may return to him his entrance money, provided it obtain the unanimous consent of all the contestants.

RULE 12.—LOADING GUNS.

No cartridges shall be placed in the gun until the shooter has taken his place at the score. In single target shooting only one cartridge shall be placed in the gun. All cartridges must be removed from the gun before the shooter leaves the score, and the shooter shall open his gun before turning away from the score. The penalty for violation of this rule shall be at the discretion of the referee, who, after warning the shooter, may, if the violation is persisted in, declare him to have forfeited his entrance fee and rights in the match.

RULE 13.—POSITION OF THE GUN.

Any the shooter may adopt.

RULE 14.—SINGLE TARGET SHOOTING.

If two targets are sprung at the same time, and the contestant does not shoot, he shall be allowed another target; but if he fires, the result shall be scored.

RULE 15.—DOUBLE TARGET SHOOTING.

Section 1. The traps shall be set to throw targets as provided in Rule 7, Sections 1, 2 and 3. Both traps must be pulled simultaneously; if in the opinion of the referee there is an appreciable interval between the springing of the two traps, and if the contestant does not fire, he shall be allowed another pair; but if he fires the result shall be scored. Each contestant shall shoot at three or five pairs consecutively before retiring. If three traps are used the first pair shall be thrown from Nos. 1 and 2; the second from Nos. 2 and 3; the third from Nos. 1 and 3; the fourth from Nos. 1 and 2; the fifth from Nos. 2 and 3. If five traps are used the first pair shall be thrown from Nos. 2 and 3; the second from Nos. 3 and 4; the third from Nos. 2 and 4; the fourth from Nos. 2 and 3; the fifth from Nos. 3 and 4.

Section 2. If only one target be thrown, it shall be declared "no target," whether broken or missed.

Section 3. If one target be a fair one and the other an imperfect target, it shall be declared "no targets," but if the shooter fires at an imperfect target, or targets, the result shall be scored.

Section 4. If a target be lost owing to any defect in the gun or load, causing a misfire, or if the shooter is interfered with or balked, or there is any other similar reason why it shall be done, the referee shall allow another pair.

Section 5. If both targets are broken by one barrel, it shall be declared "no targets." If the shooter fires both barrels intentionally at one target, it shall be scored "lost targets," but if the second barrel be fired simultaneously with the first barrel it shall be declared "no targets," provided the referee is satisfied that the second barrel was accidentally discharged.

Section 6. If the second target be lost through the safety bolt "jarring back," that target shall be declared a "lost target."

(By "jarring back" of the safety is meant that action of the safety bolt sometimes produced by the discharge of the first cartridge, the safety bolt going back to safe and rendering it impossible to fire the second cartridge without a readjustment of the safety bolt.)

RULE 16.—RAPID-FIRING SYSTEM.

When the rapid-firing system is used, there shall be a screen before each trap, on which shall appear the number of the trap, commencing from No. 1 on the left to No. 3 or 5 on the right, and each shooter shall stand at the score opposite the trap from which the target is to be thrown for him to shoot at. After he has shot at his first target he shall pass to the next score on his right and so continue until he reaches the end of the score, when he shall return to the score opposite No. 1 and continue as before until he has finished shooting. Where three traps are used four men shall be called to the score at the same time; the first three men on the score sheet shall face respectively Nos. 1, 2 and 3 traps; the fourth man shall take his stand in rear of No. 1 man, stepping up to the No. 1 score as soon as it is vacated. The fourth man is called the "pivot man."

(N. B.—As soon as the "pivot man" has taken No. 1's place, the man who has shot from No. 3 score shall walk up to No. 1 score and become the "pivot man" for the time being.)

Where five traps are used, the first five men on the score sheet face respectively Nos. 1, 2, 3, 4 and 5 traps; No. 6 man is the "pivot man." The procedure with five traps is similar to that with three traps. Squads of five men instead of six may be formed; in such cases the five men shall stand in their respective positions and shall shoot as follows: In 10-target events, 2 targets at each position before moving to the next; in 15-target events, 3 targets before moving; in 20-target events, 4 targets before moving; in 25-target events, 5 targets before moving.

RULE 17.—KNOWN TRAPS AND KNOWN ANGLES.

Section 1. When the shooting is at known traps and known angles, the traps shall be adjusted to throw targets as provided in Rule 7. The method of shooting off events at this style of shooting shall be the same as that set forth in Rule 16.

KNOWN TRAPS AND UNKNOWN ANGLES.

Section 2. When the shooting is at known traps, unknown angles, the shooter shall know which trap is to be sprung for him, but shall not know which angle the target is to be thrown at from that trap. Referees shall see to it that the trappers change the flight of the targets frequently. At unknown angles, any target that is thrown behind the line of the screen may be refused by the shooter, and he shall be allowed another target; but if he fires the result shall be scored. The method of shooting off events at this style of shooting shall be the same as that set forth in Rule 16.

EXPERT RULES, RAPID FIRE.

Section 3. The traps shall be set to throw targets as provided in Rule 7. The shooters shall take their stands at the score in the manner prescribed for rapid firing in Rule 16. An indicator shall be used to decide the order in which the traps are to be pulled. When five traps are used, the shooter standing in front of No. 1 trap shall shoot at a target thrown from any of the five traps. The shooter in front of No. 2 shall shoot at a target thrown from any of the four remaining traps. The shooter in front of No. 3 shall shoot at a target thrown from any of the three remaining traps. The shooter in front of No. 4 shall shoot at a target thrown from either of the two remaining traps; while the shooter in front of No. 5 shall have the remaining trap pulled for him. As soon as No. 5 has shot, the "pivot man" shall shoot from No. 1 score at a target thrown as prescribed for the man in front of No. 1 and so on. When a target is broken by the trap, or there is a balk, and the shooter does not accept the target, he shall be awarded another target, the indicator being changed and a new combination designated. If the balk occurs when No. 1 is shooting, the procedure is the same as if there had been no balk. If it occurs when the man in front of No. 2 is shooting, the puller shall pull that trap whose number appears first in the new combination, provided it be not the number of the trap pulled for No. 1 man. If the balk occurs when the man in front of No. 3 is shooting, the puller shall pull the trap whose number appears first in the new combination, provided always that he does not pull either of the two traps already pulled for the men in front of Nos. 1 and 2. If the balk occurs when the man in front of No. 4 is shooting, the puller shall pull either of the two remaining traps according to the order in which the numbers of these two traps appear in the new combination. If the balk occurs when the man in front of No. 5 is shooting, the same trap shall be pulled, the man in front of No. 5 always knowing his trap. If at any time the shooter fires at an imperfect target the result shall be scored. As soon as all five traps have been pulled a new combination shall be designated by the indicator. When three traps are used the procedure is modified accordingly and is similar to that described above.

(Note.—In explanation of the above, suppose No. 1 has shot at a target from No. 2 trap, and No. 2 at a target from No. 5 trap, and a balk occurs when No. 3 is shooting. Say the combination was 2, 5, 4, 3, 1, and suppose the new one is 1, 2, 5, 4, 3. No. 3 will get No. 1 trap, No. 4 will get No. 4 trap and No. 5 will get No. 3 trap, unless another balk occurs and another combination is brought into play. The combination is always changed as soon as the shooter at No. 5 has fired.)

EXPERT RULES, ONE MAN UP.

Section 4. The traps shall be set to throw targets as provided in Rule 7. The shooter shall take his position at the score in front of No. 3 trap. The puller shall pull the traps as directed in Section 3 of this Rule (Rule 17), precisely as if six men were at the score. In the case of imperfect targets or balks the puller shall pull the traps as ordered in Section 3 of this rule, where it relates to balks, each man at the score firing at a target thrown from each of the five traps before retiring, and always knowing his last trap. If a shooter fires at an imperfect target the result shall be scored. When three traps are used the shooter stands in front of No. 2 trap and shoots at 3 targets before retiring. In all other respects the procedure is similar to that for five traps.

EXPERT RULES—UNKNOWN TRAPS AND ANGLES.

Section 5. The traps shall throw targets at unknown angles within the limits prescribed in Rule 7, and in Section 2 of this rule (Rule 17). The procedure, if the shooting be rapid fire, shall be the same as ordered in Section 3 of this rule (Rule 17). If the shooting be one man up, the traps shall be pulled as ordered in Section 4 of this rule (Rule 17). If a shooter accepts an imperfect target, the result shall be scored. Where three traps are used the procedure is similar to that for five traps.

REVERSED ORDER.

Section 6. The trap shall be adjusted to throw targets as provided in Rule 7. The man in front of No. 1 trap shall shoot at a target thrown from No. 5; the man in front of No. 2 shall shoot at a target thrown from No. 4; the man in front of No. 3 shall shoot at a target thrown from No. 3; the man in front of No. 4 shall shoot at a target thrown from No. 2, and the man in front of No. 5 shall shoot at a target thrown from No. 1. If the shooter fires at an imperfect target the result shall be scored.

(N. B.—Sometimes, to make the shooting a little harder, it has

been found advisable to adjust Nos. 2, 3 and 4 traps to throw targets at unknown angles, and this system is strongly recommended.)

RULE 18.—CLASS SHOOTING.

All shooting shall be class shooting unless otherwise stated. (Class shooting provides that all shooters tied for first place shall receive their pro rata share of first money; all those tied for second place shall receive their pro rata share of second money, and so in all other places, third, etc.)

Any shooter in a tie for either of the moneys may withdraw his pro rata share of that money, unless the programme prescribes that all ties shall be shot off.

RULE 19.—BROKEN TARGETS.

A target to be scored to the shooter must have a perceptible piece broken from it while in the air. A "dusted" target shall not be scored to the shooter. No target can be retrieved for shot marks. If a target be broken by a trap the shooter shall be allowed another target, but if he fires the result shall be scored.

RULE 20.—ALLOWING ANOTHER TARGET.

Section 1. The shooter shall be allowed another target for any of the following reasons: 1. For a target broken by the trap. 2. For any defect in the gun or load causing a misfire. [The failure to cock the gun or properly adjust the "safety" is considered to be the result of the shooter's own carelessness, and shall not be considered as a defect in the gun or load; a target lost under these conditions shall be scored "lost."] 3. If the contestant is interfered with, or balked, or there is any other similar reason why it should be done, the referee may allow another target.

(N. B.—The "jarring back" of the safety is not considered a defect of the gun.)

Section 2. When the shooting is at known traps, the shooter shall have another target from the same trap; but if the shooting is at unknown traps he shall be allowed a target from some trap, as provided in Rule 17, Sections 3, 4 and 5.

RULE 21.—LOST TARGETS.

Targets shall be scored "lost" for any of the following reasons: If the shooter fails to load or cock his gun, or to properly adjust its "safety," or pulls the wrong trigger.

RULE 22.—MISFIRE.

When a cartridge placed in either the right or left barrel apparently fails to explode when the trigger is pulled, the shooter must on no account open his gun, but shall hand it to the referee, whose duty it shall be to try both triggers without previously opening the gun to cock it. If the cartridge be then exploded the shooter shall be awarded a "lost" target, but if the referee shall find that the proper trigger has been pulled, and that the cartridge has failed to explode through no fault of the shooter, he shall allow another target, as provided in Rule 20, Section 2. Any shooter who shall open his gun after a misfire, instead of handing it unopened to the referee for his inspection, shall be awarded a "lost" target.

RULE 23.—FAILURE TO EXTRACT IN A REPEATING SHOTGUN.

In double target shooting, or in events where "both barrels" are allowed, when a shell cannot be extracted from the chamber of a repeating shotgun for either of the following reasons, the shooter shall be allowed another target: 1. When the brass head of the shell pulls away from the paper, leaving the empty shell in the chamber and preventing the loading of the gun from the magazine. 2. When the extractor, although apparently in good order, passes the shell and leaves it in the chamber, preventing the loading of the gun from the magazine. In either of the above cases the referee shall allow another target, as if there had been a misfire. The shooter must, however, immediately upon the failure to extract and without attempting again to remove the empty shell from the chamber, hand his gun to the referee for his inspection. (The failure to comply with this provision shall be treated as a violation of Rule 22, and shall be penalized as such.) Nothing in this rule shall be construed as empowering a referee to ward another target for either of the following reasons. 1. When the shell, although extracted from the chamber, has not been ejected from the gun. 2. When the feeding of a cartridge from the magazine has been blocked by the use of a shell too long for the chamber of the gun. 3. When the referee is satisfied that the shooter is using reloaded ammunition. In all such cases the referee must decide that it is the shooter's fault, and the result of the shot shall be scored.

RULE 24.—ANNOUNCING THE SCORE.

Section 1. The result of each shot shall be announced plainly, and it shall be called back by the scorer each time. The call for a broken target shall be "Dead"; for a lost target the call shall be "Lost."

Section 2. When two judges and a referee are serving, one of the judges shall announce the result of each shot distinctly, the scorer answering him accordingly each time. If the other judge disagrees with the decision of the judge calling, he shall make his protest at once, before another shot is fired, and the referee shall then give his decision, which shall be final. In case of another target being thrown before the referee's decision has been made, the target so thrown shall be a "no target," whether broken or lost.

Section 3. At the close of each shooter's score the result of it must be announced. If claimed to be wrong, the error, if any, must be corrected at once.

RULE 25.—TIE SHOOTING.

Section 1. All ties shall be shot off at the original distance, and as soon after the match as practicable, at the following number of targets:

(a) Ties on Single Targets.—In single target matches of 25 targets or less, on three traps at 3 targets, and on five traps at 5 targets; in matches of less than 50 targets and more than 25 targets, on three traps at 6 targets, and on five traps at 10 targets; in matches of over 50 targets, on three traps at 15 targets, and on five traps at 25 targets.

(b) Ties on Double Targets.—In double target matches of 10 pairs or less, ties shall be shot off at 3 pairs; in matches of more than 10 pairs, at 5 pairs. Unless otherwise stated by the management and so understood prior to the commencement of the match, the targets in the shoot-off shall be thrown as provided in Rule 15.

(c) Ties in Handicap Events.—All ties for trophies shall be shot off at 25 targets per man. In 100-target events each contestant in the tie shall receive in the shoot-off one-fourth his original handicap allowance and no more. In 50-target events, one-half. In 25-target events, ties shall be shot off under the original conditions. Thus, suppose in a 100-target event A received 11 extra targets, in the shoot-off he could only receive 2, as the odd targets could not be divided, and so on.

RULE 26.—SHOOTING OUT OF TURN.

When a shooter fires out of turn, the target so fired at shall be a "no target," whether broken or missed. When two shooters fire simultaneously at the same target that target shall be declared a "no target," whether broken or missed.

RULE 27.—SHOOTER AT THE SCORE.

In all contests the shooter must be at the score within three minutes after his name is called to shoot, or he forfeits his right in the match.

RULE 28.—FORBIDDEN SHOOTING.

No shooting will be permitted on the shooting grounds other than at the score. If there be no inclosure, no shooting shall be permitted within 10yds. of the score without the consent of the management.

RULE 29.—RIGHT TO REFUSE ENTRANCE.

The management may refuse to accept the entrance of any shooter guilty of ungentlemanly conduct, or who "drops for place."

Special Rules for Shooting under the Sergeant System, or with any Form of Magazine Trap.

RULE 1.

Section 1. The trap shall be set in a pit, properly screened, and the shooting scores laid out in a segment of a circle with a radius of 16yds. The scores shall be 3 or 5yds. apart, and numbered from No. 1 on the left to No. 5 on the right.

Section 2. Where three traps are arranged on the Sergeant system, they shall be placed 1½yds. apart behind a suitable screen. Under the Sergeant system no shooter should know which trap is to be pulled for him.

RULE 2.

The trap or traps shall be set to throw targets a distance of

not less than 40yds. or more than 60yds., so that the elevation of the target in its flight at a distance of 10yds. from the trap shall not be less than 6ft. or more than 12ft. from the ground.

RULE 3.

If for any reason, after the trap or traps have been properly adjusted, the target should not fly the proper height or distance, it shall be considered a fair target—provided it flies high enough and far enough, in the opinion of the referee, to offer a fair shot to the contestant.

RULE 4.

To insure targets being thrown the same distance, three or more pegs should be placed in a semi-circle in front of the trap or traps, at a distance of 50yds. therefrom. If, in the opinion of the referee, the targets are being thrown more than 10yds. beyond or more than 10yds. short of these pegs, the referee shall instruct the trapper to be more careful.

RULE 5.

In rapid-fire shooting, squads of five men may be formed. Contestants may shoot in rotation, from one to five, and each one may shoot at 2 targets in a 10, 3 in a 15, 4 in a 20, and 5 in a 25-target event, and then all shall move up one position. In this way each contestant shall shoot at an equal number of targets from each of the different positions.

[Other points are covered by previous rules on target shooting.]

Live Birds.

RULE 1.—REFEREE.

A referee shall be appointed by the contestants in a match, or by the management, whose decision shall be final.

RULE 2.—DUTIES OF REFEREE.

The referee shall see that the traps are properly set at the beginning of the match and kept in order to the finish, and that they are kept properly filled. He may at any time, and must, when so requested by a contestant, select one or more cartridges from those of a shooter at the score, and publicly test the same for proper loading. If the cartridge or cartridges be found to be improperly loaded, the shooter shall suffer the penalty provided in Rule 18.

RULE 3.—SCORER.

A scorer shall be appointed by the contestants in a match, or by the management, whose score shall be the official one. All scores shall be plainly kept, and the scoring of a lost bird shall be indicated with a cipher, and of a dead bird by the figure 1 if one barrel only is used, or by the figure 2 if both barrels are used.

RULE 4.—PULLER.

Section 1. A puller shall be appointed by the contestants in a match or by the management, and he shall be placed at least 6ft. behind the shooter's score. It shall be the puller's duty to pull the traps instantly after the shooter has called "Pull." He shall use a trap pulling indicator, or other device that may be furnished by the management for that purpose, and he shall pull the trap so indicated. He shall also use his best endeavors to conceal from a shooter at the score the trap that is to be pulled for him. The contestants in a match may appoint a judge, who shall be entitled to see that the puller pulls the traps as indicated. Should the puller not pull in accordance with the indicator he shall be removed and another puller substituted.

Section 2. All traps must be filled before the shooter calls "Pull." Should a trap be left unfilled, and should one of the contestants fire at a bird from one of the other traps, and kill it, such bird shall be declared a "no bird," but if he miss it it shall be declared a "lost bird."

Section 3. If more than one bird be liberated when shooting at single birds, the shooter may call "no bird," but if he shoots the result shall be scored. Both barrels must be fired at the same bird if the second barrel is required.

Section 4. The shooter, when he is at his score ready to shoot, shall give the caution, "Are you ready?" to the puller, who shall answer back, "Ready." The shooter shall then call "Pull" clearly and distinctly. Should the trap be pulled without the proper word being given, or should it not be pulled promptly after the word has been given, the shooter may accept the bird or not, but if he fires the result must be scored.

Section 5. The puller shall not pull the trap until the trapper and the dog (if one be used for retrieving dead birds) are back in their places, even should the shooter call "Pull."

RULE 5.—ARRANGEMENT OF TRAPS.

All matches shall be shot from five ground traps, placed 5yds. apart, in the segment of a circle. The radius of the circle shall be 30yds., and the central point of that circle shall be the 30yds. score (or mark). All other scores of a less distance shall be measured from this point along an imaginary line drawn directly toward No. 3 trap; for distances greater than 30yds. the imaginary line above mentioned shall be continued behind the 30yds. score, and the distances marked off on it. The traps shall be numbered from left to right, No. 1 being the trap on the extreme left and No. 5 the trap on the extreme right.

(Note.—A ground trap is one that lies flat with the surface of the ground when open, and gives the bird its natural flight when starting.)

RULE 6.—THE RISE.

In all events, unless otherwise stated, the rise shall be: 30yds. for 10-bore guns; 28yds. for 12-bore guns; 26yds. for 14 and 16-bore guns; 25yds. for 20-bore guns.

RULE 7.—BOUNDARY.

Section 1. The boundary for both single and double bird shooting shall be a segment of a circle, 50yds. in diameter, and a dead line. The circle shall be drawn from the center trap, it shall terminate where it joins the dead line on each side of the shooter's score. The dead line, unless otherwise provided for by the management, shall be a line drawn at a distance of 33yds. from the center trap, and at right angles to a line drawn from the shooter's score to the center trap.

Section 2. When a boundary is marked by stakes set in the ground or by flags, or by any other method not showing a continuous segment of a circle, the boundary shall be considered to be imaginary straight lines drawn from each of such stakes or flags to the one nearest it on either side.

Section 3. Should any portion of the bird be on the line or touching it, such bird shall be declared a "dead bird" and shall be scored as such. (This section does not apply where the boundary line is marked by a fence or strip of wire netting.) A bird once over the fence or outside the wire netting is a "lost bird."

Section 4. When the boundary line is marked by a fence or wire netting, a bird shall be scored a "lost bird" when it reaches the top of that fence or wire netting and perches on it. (It shall not be necessary for the bird to close its wings after reaching the top of such fence and perching on it before being declared a "lost bird.") A bird once over the boundary is a "lost bird."

RULE 8.—BIRDS REFUSING TO FLY.

Section 1. When a bird refuses to fly on the trap being pulled, such artificial means as may be provided by the management for that purpose may be used to start it, by direction of the referee. A bird hit with a missile or held by the trap shall be declared a "no bird" by the referee. The shooter may declare a bird that refuses to fly when the trap is pulled a "no bird."

Section 2. A bird that has been "on the wing" cannot be called a "no bird" by the shooter, but he may fire at it on the ground with the intention of making it a "no bird." If the bird so fired at is gathered within bounds, it shall be declared a "no bird," but if it escapes after being fired at, it shall be declared a "lost bird." (A referee should always, in doubtful cases, inform the shooter whether the bird has been "on the wing" or not.)

Section 3. It shall be the referee's duty at all times to call "no bird" when, in his opinion, such bird is incapable of proper flight, whether it has been "on the wing" or not. He shall also call all birds that walk in 1yd. from the trap toward the shooter's score "no bird," whether they have been "on the wing" or not. All birds called "no birds" by the referee shall not be charged against the shooter.

RULE 9.—GATHERING BIRDS.

A bird to be scored dead must be gathered within bounds before another bird is shot at, and within two minutes' time after it has touched the ground, by a dog or by the shooter, or by any person appointed by the shooter for that purpose. No extraneous means shall be used in gathering the bird, and only one person shall be allowed to gather any bird. If the gatherer cannot locate the bird he may be directed to its location by the referee or some person whom the referee shall appoint for that purpose. Where a dog is used for retrieving birds, if the dog cannot locate the bird the time limit shall not be considered to have commenced until the referee has directed the handler of the

dog to call the dog in. Then, as soon as the dog has returned to his handler, the shooter or some person designated by him shall go to gather the bird, and the time limit of two minutes shall commence from the time the dog returned to its handler. In case of a dog "pointing," the referee shall have power to send a man to gather the bird, and to extend the time limit.

RULE 10.—BIRDS KILLED ON THE GROUNDS.

A bird killed on the ground with a first barrel is a "no bird." A bird may be killed on the ground with the second barrel, if the first barrel is fired while the bird is on the wing. If a bird is shot at on the ground with the first barrel, he may use his second barrel, but such bird, if gathered, is a "no bird"; if lost it is a "lost bird."

RULE 11.—MUTILATING BIRDS.

No mutilation of birds shall be allowed. If it is proved to the referee that any contestant or agent of his has violated this rule or is a party to such violation the referee shall declare all the rights of such contestant in the match to be forfeited.

RULE 12.—OUT OF BOUNDS.

A bird once out of bounds is a "lost bird." Should, however, the boundary be marked by a fence and a bird escape through any opening in that fence, it shall be a "no bird," if in the opinion of the referee it could not have flown over. The word "opening" shall be taken to mean any opening, whether permanent or otherwise.

RULE 13.—BIRDS SHOT AT BY ANOTHER PERSON.

If a bird that has been shot at by a shooter shall be shot at by another man before it has been out of bounds, the referee shall decide whether, in his opinion such shooting has deprived the man at the score of a bird that might have been scored as a "dead bird"; if he is of such opinion it shall be declared "no bird," and the shooter shall be allowed another bird; if he is not of such opinion, it shall be declared a "lost bird."

RULE 14.—SHOOTING FROM A SCORE OTHER THAN THE PROPER ONE.

If any shooter shoots at a distance nearer than his proper score, the bird, if killed is a "no bird," but if lost it is a "lost bird." But if the shooter should shoot at any distance exceeding his proper score, the bird if missed shall be a "lost bird"; if killed it shall be a "dead bird"; but should the shooter, by direction of the referee or scorer, shoot at any distance greater than his proper score, the bird if killed shall be a "dead bird," but if lost a "no bird."

RULE 15.—SIMULTANEOUS DISCHARGE OF BOTH BARRELS.

If, in shooting at a bird, both barrels should be simultaneously discharged, it shall be called a "no bird," whether killed or missed. [It should be understood that the word "simultaneous" covers the case in which the discharge of one barrel "jars off" the other barrel.]

RULE 16.—SHOOTING OUT OF TURN.

Should a shooter shoot out of turn, the result of the shot shall be scored, provided he has otherwise complied with the rules governing the match. A referee may, whenever he deems it advisable for the purpose of saving time, call up any shooter to the score, whether it be such shooter's turn to shoot or not.

RULE 17.—POSITION OF THE GUN.

Any the shooter may adopt.

RULE 18.—LOADS.

The charge of powder shall be unlimited. The charge of shot shall not exceed 1½oz., any standard measure, struck. Any shooter using a larger quantity of shot shall forfeit his entrance money and rights in the match. If, however, the management is of the opinion that the shooter has not willfully violated this rule, it may return to him his entrance money, provided it obtain the unanimous consent of all the contestants.

RULE 19.—CALIBER AND WEIGHT OF GUN.

No gun of larger caliber than a 10-bore shall be used. Weight of gun unlimited.

RULE 20.—LOADING GUNS.

Cartridges must not be placed in the gun until after the shooter is at the score. Cartridges must be removed from the gun before the shooter leaves the score. If any shooter, after being warned by the referee, shall continue to violate this rule, the referee is empowered to declare all such shooter's rights in the match to be forfeited.

RULE 21.—LEAVING THE SCORE.

Section 1. A shooter having fired his first barrel and left the score cannot return to the score to fire his second barrel.

Section 2. A shooter having fired his first barrel, and having opened his gun, cannot close his gun again for the purpose of firing his second barrel.

RULE 22.—GUN NOT COCKED.

If the gun is not cocked or the safety not properly adjusted and the bird escapes, it shall be scored a "lost bird."

RULE 23.—MISFIRES.

Section 1. Whenever a cartridge misfires or apparently misfires, the shooter must on no account open his gun, but shall hand it to the referee for his inspection, and it shall be the referee's duty to try both triggers without having previously opened the gun for the purpose of cocking it. Should the cartridge which the shooter says has misfired be exploded, the bird shall be declared a "lost bird." If a shooter opens his gun before handing it to the referee, the bird shall be declared a "lost bird."

Section 2. Misfires with Right Barrel.—If the shooter's gun misfires with the right barrel, and he does not fire the second barrel, he shall be allowed another bird. But if the shooter's gun misfires with the first barrel and he uses the second barrel and misses the bird such bird must be scored a "lost bird," but if the bird be killed with the second barrel while on the wing, it shall be scored a "dead bird."

Section 3. If a misfire occurs with the second barrel, the shooter shall have another bird, using a full charge of powder only in the first barrel. He must, however, put the gun to his shoulder and discharge the blank cartridge in the direction of the bird, and the bird must be on the wing when such blank cartridge is discharged.

RULE 24.—FAILURE TO EXTRACT IN A REPEATING SHOTGUN.

When a shell cannot be extracted from the chamber of a repeating shotgun for either of the following reasons, the shooter shall be allowed another bird, as provided in Section 3 of Rule 23: 1. When the brass head of the shell pulls away from the paper, preventing the reloading of the chamber from the magazine. 2. When the extractor, although in apparently good condition, fails to extract the empty shell from the chamber.

(N. B.—Nothing in this rule shall be construed as empowering the referee to allow another bird if he is satisfied that the shooter is using reloaded ammunition.)

RULE 25.—SHOOTER AT THE SCORE.

In all contests the shooter must be at the score within three minutes after his name has been called for him to shoot or he forfeits his rights in the match.

RULE 26.—BALK.

If a shooter is distinctly balked or interfered with by any opponent or a spectator, or by the trapper, whether by accident or design, or if there be any other similar reason why it should be done, the referee may allow him another bird, but the "balk" should be very palpable to be allowed by the referee.

RULE 27.—ANNOUNCING SCORE.

The referee shall announce the result of each shot distinctly, and it shall be called back by the scorer. At the close of each shooter's score the result must be announced, and if claimed to be wrong, the error, if any, must be corrected at once.

RULE 28.—TIE SHOOTING.

All ties shall be shot off at the original distance and as soon after the close of the match as practicable, at the following number of birds: In matches of 10 birds or less, at 3 birds; in matches of 11 to 25 birds, inclusive, at 5 birds; in matches of 26 to 50 birds, inclusive, at 10 birds; in matches of 51 to 100 birds, inclusive, at 25 birds. If in a series of matches the result be a tie, such ties shall be shot off at the original number of birds.

RULE 29.—CLASS SHOOTING.

All shooting shall be class shooting unless otherwise stated. (Class shooting provides that all shooters tied for first place shall

receive their pro rata share of first money; all shooters tied for second place shall receive their pro rata share of second money; all those tied for third place, etc.) Any shooter in a tie for either of the moneys may withdraw his pro rata share of that money unless the programme prescribes that all ties shall be shot off.

RULE 30.—BIRDS RETRIEVED BY DOGS.

When a dog is used to retrieve dead birds, the bird shall be scored a "dead bird" when the dog has had it in his mouth; if a man retrieves, the bird shall be scored a "dead bird" when he has had it in his hands.

RULE 31.—DOGS ESCAPING FROM HANDLER.

Should a dog that is being used for retrieving escape from the handler, or be let go before the shooter has opened his gun or called "Dog," and the bird escapes from within the boundary, the shooter may have another bird, provided the referee is of the opinion that the bird would have been gathered within the time limit if the dog had not been so released or escaped from its handler.

RULE 32.—SHOOTER TO CALL MAN OR DOG.

The shooter after firing must call "Man" or "Dog"; should he fail to do so, the opening of his gun shall be considered as a signal by the handler to let the dog go.

RULE 33.—BIRD LOST THROUGH NEGLIGENCE OF SHOOTER.

If the shooter advances to the mark and orders the trap to be pulled and does not shoot at the bird, or his gun is not properly loaded, or does not go off owing to his own negligence, the bird must be scored as a "lost bird."

RULE 34.—SHOOTER'S FEET AT THE SCORE.

The shooter's feet shall be behind his shooting mark until after his gun is discharged.

RULE 35.—ENDANGERING PERSON OR PROPERTY.

If a bird shall fly so that to shoot at it would endanger any person or property, it shall not be shot at, and the referee shall allow another bird.

RULE 36.—FORBIDDEN SHOOTING.

No shooting shall be permitted within the inclosure other than at the score; and in case there is no inclosure, no shooting shall be permitted within 200yds. of the score, except by those at the score, without the consent of the management.

RULE 37.—UNFINISHED MATCHES.

In case of darkness or unfavorable conditions of weather putting a stop to a match before it has been finished, such match shall be carried over to some date within two weeks of the date of the match, to be mutually agreed upon by the parties to the match. Should the parties to the match fail to agree upon date, the referee shall name date and hour for continuing the match. Such date and hour to be within the prescribed limits. Either of the parties failing to appear on the date and at the hour set, shall be adjudged loser of the match and shall forfeit all his rights in the same.

RULE 38.—MAKING CLAIMS UNDER THE RULES.

All claims under the rules must be made before the succeeding shot has been fired.

The Handicap Committee.

NEW YORK, Feb. 8.—*Editor Forest and Stream:* The Interstate Association has appointed the following committee to award handicaps for the Grand American Handicap of 1899, which takes place at Elkwood Park, N. J., April 11-13 next: Jacob Pentz, Bernard Waters, New York city; Will K. Park, Philadelphia, Pa.; W. R. Hobart, Newark, N. J.; Hon. T. A. Marshall, Keithsburg, Ill.; T. A. Divine, Memphis, Tenn.; Elmer E. Shaner, Pittsburg, Pa. The committee will meet at the Astor House, New York city, on Thursday, April 6, two days after the closing of entries.

EDWARD BANKS,
Secretary-Treasurer.

Answers to Correspondents.

No notice taken of anonymous communications.

C. E. S., Schenectady, N. Y.—For cocker spaniels address New-castle Kennels, Brookline, Mass.

H. A., New York.—Can you inform us where we can purchase bull pups? Ans. See reply to G. E. T., Baltimore.

R. R., Wallingford, Conn.—In respect to the address of breeders of Great Danes see answer to similar query in this department.

C. A. D., Welch, W. Va.—Please furnish me with the address of breeders of bull terriers. Ans. See answer to G. E. T., Baltimore.

Sinnaker.—Mr. Chas. Hallock writes: "I don't know what a sinnaker bear is, unless it is negro for cinnamon. But the Hyde county bears are jet black in prime coat." Can any reader give us the meaning of the word "sinnaker" as applied to bears in North Carolina?

C. A., Atlanta.—The rules governing the Grand American Handicap will be published in *FOREST AND STREAM* next week. The programme will not be ready before March 1. We have no knowledge of any arrangement for reduced rates with the railroads. Address, Mr. Edward Banks, Secretary-Treasurer, Interstate Association, 318 Broadway, New York.

Flying Fish.—Can you inform me as to the maximum size which flying fish attain? I have a pair of wings which I cut from a fish which flew on board ship in which I was a passenger. They measured on the fish full 17in., tip to tip, and the fish almost exactly the same length. Is this large or only ordinary? Ans. The Atlantic flying fish in West Indian waters attains a length of nearly a foot, and a breadth between wing tips of 11in. The California species attains a length of 16in. to 17in.

G. E. T., Baltimore, Md.—Will you give me the address of several parties who have high-bred beagles for sale? Ans. We regret that we cannot give you definite information on the subject. When breeders neglect to keep us informed in respect to the stock they have for sale, we are without the necessary information concerning it.

Aquarium.—It has been suggested that you will be able to decide some points as below outlined, and would be obliged if you would answer same in your next issue:

First is, that there are more varieties of fish off New York (meaning possibly within a radius of fifty miles) than there are off the city of Naples, Italy.

Second is, that there are 100 more varieties lower class fish in the Naples aquarium than there are in the New York Aquarium.

Third is, that there are more varieties in the Bay of Naples of fish not here than there are varieties here of fish not there. Ans. The first proposition must be answered in the negative. By the term "off New York" we understand that marine fishes are to be considered. The number of kinds of marine fishes recorded from Long Island and the adjacent waters is 200. Naples, according to the most recent catalogue by Dr. Carus, has 310 species of fishes. The fish fauna of the Mediterranean is marvelously rich, and the Bay of Naples is merely an arm of the Mediterranean.

The second statement is correct if by "lower class fish" be intended the shellfish, crustaceans, starfish and their allies, sponges, corals, and numerous other animals without backbone, which inhabit the Bay of Naples, and may be found in the catalogue of the Naples aquarium. The New York Aquarium has published no catalogue, and its collections are not labeled, but it does not contain a large number of kinds of the lower forms of marine life as compared with the aquarium at Naples.

The third proposition is true—the Bay of Naples contains a far greater variety of fishes than the whole coast of Long Island and adjacent waters, and there are comparatively few kinds that are common to the two contrasted regions.

PUBLISHERS' DEPARTMENT.

THE Osgood Folding Boat Co., of Battle Creek, Michigan, whose advertisement is found in another column, were one of the first concerns in the country to make folding boats, and the product of their factory has been found on many waters. The rapid and wide extension of this business is a remarkable feature of the use of canoes in this country, where the canvas boat now threads all the waters on which the birch canoe of the savage used to pass.—*Adv.*

"The sale of game should be forbidden at all seasons."
—FOREST AND STREAM, Feb. 3, 1894.

This digression up the Kansas was undertaken by Lisa to form new connections with the Indians, to trade and take game, in all which he succeeded to his expectations. During this trip I witnessed, for the first time in my life, with painful sensations the wide and wanton destruction of game merely to procure skins; and so much disgusted was I, on seeing the buffalo carcasses strewn over the ground in a half-putrified state, that my reluctance to fulfill my engagements was so much increased as to occasion me to reflect seriously on absconding from the party. —John D. Hunter, "Manners and Customs of Several Indian Tribes Located west of the Mississippi." Philadelphia, 1823.

THE BIRDS AND THE STORM.

THE great storm of last Sunday and Monday was the fiercest and coldest with which the Atlantic States have been afflicted since that of 1888. It was terrific both in its force and volume. For a week previous the thermometer dallied near the zero point, and there were a few snowstorms, thought to be so at the time at least, but which, compared with the blizzard of Sunday and Monday, were mere mild weather disturbances. The blizzard raged steadily for hours, and gradually conquered all the efforts of the world of commerce to prevail against it. The heavy snowfall, driven with stinging force before the gale, seemed to fly parallel with the earth's surface where there were no obstacles in its course; in other places it swirled about swiftly in fantastic eddies, chased up the sides of high buildings, or settled into deep drifts wherever the wind would let it rest. With it came untold hardship and suffering to men on sea and land. Great ships came in with such cloaks of ice that their lines and appearance were more those of an iceberg than of a graceful, shapely craft designed by man. The traffic of the great railroads was either partially or wholly suspended. The commerce of New York for a time was little short of complete inaction. The food and fuel supply was seriously cut off for a time, which brought want to the doors of the great class of workers whose means permit them to live only from day to day. Truckmen and many others dependent on traffic for their employment could not work, though willing to do so. In consequence the charity organizations were overwhelmed with applications from the needy; and sadder still, many, who could not adequately protect themselves from the fury of the storm, perished. And doubtless, too, there was relatively the same amount of suffering everywhere within the area of the storm. It could not be otherwise with such fierce gales and steady snowfall and deadly cold in earth and air. Humanity, however, set its forces in action to relieve the distress of the suffering and needy.

But in the woods and fields, exposed to all the inclemency of the storm, are the game birds. To them a certain degree of cold is endurable and they can also withstand the pangs of hunger to a certain degree; but, as with man, there is a limit to their endurance. In such a storm, shelter and a food supply are essential to their existence. In ordinary winter weather they can care for themselves. The struggle for existence has many more serious problems for them than it has for mankind. To them, now, one practical act of assistance is worth all the theorizing in the world. He who, with some old rails or limbs of trees, hay, brush, or rubbish, makes a good tight lean-to or any kind of snug-harbor within which they can find shelter, and therein leaves some corn, oats, wheat, buckwheat, or other grain for food, is more of a real game protector than are all the others who can do some practical good, but who do not do it. Sportsmen in the city, who have favorite nooks and corners wherein they are wont to seek the quail and ruffed grouse in proper season, have farmer friends who would be glad

for a small consideration to put some food in the haunts of the birds, the aforesaid nooks and corners, and thereby aid in their preservation as much as lies within the powers of man. The practical game preserver at this season is far ahead of the theoretical one. A sheaf of grain is worth a whole haystack of talk.

This suffering of the game birds is not confined to any locality. From Texas and Louisiana and Florida on the south, to the Canadian boundary on the north, the same conditions prevail, the same suffering is inevitable and the same loss probable. The only encouraging fact in connection with the heavy snowfall is that, in most localities, the snow was light and powdery instead of being wet and heavy, as was the case in the memorable blizzard of 1888. On the other hand, the furious wind which blew for days pounded and packed the drifts into masses more or less cohesive, through which the birds can make their way to the surface, if at all, only with difficulty, slowly and by continued effort. Even after they have freed themselves from their prison, the danger of starvation must yet be faced.

Sportsmen have therefore every reason to fear a very great diminution in the country's supply of quail next season. This is likely to be much greater in the South than in the North, for the Southern birds know little of cold or snow such as they have experienced this season. They are much less hardy than our Northern birds, and succumb much more easily to rigors of climate to which they are unaccustomed.

WINTER.

WHEN the fire of youth has burned out and the ashes of age lie in a gray drift on the smoldering embers, one shivers instinctively at the name of winter. In imagination we already see the dreary desolation of the earth, stripped of its mantle of greenness and bloom and ripe fruitage, ready to don the white robe for dreamless sleep.

Gradually the change comes, the glory of autumn passes away, the brown leaves drift and waver to the earth, the summer birds fly southward to lands of perennial leaf and blossom, and leave to us but the memory of song in a desolate silent land, when the brooks must sing only to themselves under crystal roofs, and you only know they are singing by the beads of elastic pearl that round and lengthen and break into many beads as they slip along the braided current.

There are only the moaning of the wind among the hills and the rustle of withered leaves along the dun earth. A week ago it was full of life—now there is only desolation and death, yet so imperceptibly have these come that we know not when the other ceased, and we are not appalled. Then comes the miracle of snow, the gray sky blossoms into a white shower of celestial petals, that bloom again on withered stem and bough and shrub until the gray and tawny world is transformed to universal purity, and behold another miracle. Where there was no life are now abundant signs of it, the silent record of many things. Mouse, weasel and squirrel, hare, skunk and fox have written the plain story of their nightly wanderings; red-poll, bunting, crow and grouse have embroidered the history of their alighting and their terrestrial journeying on the same white page. And lo, the jay of many voices proclaims his presence, the chickadee lisps his brief song, the nuthatch blows his reedy clarinet, a white flock of snow buntings drift by with a creaking twitter like the sound of floating ice, a crow sounds his raucous trumpet, the ruffed grouse thunders his swift departure in a shower of dislodged snow, the woodpecker drums a merry tattoo, a fox barks huskily among the rugged defiles of the hills, and far away is sounded the answering challenge of a hound, and under the stars the screech owl's quavering call is heard and the storm-boding, sonorous warning of his solemn big brother of the double crest, punctuated by the resonant crack of frost-strained trees.

What beauty that lies hidden under summer leaves is revealed now in the graceful tracery of pearl enameled branch and twig, on gray trunks embossed with moss and lichen, on bent stems of tawny grass and frond of withered fern, how the uncouth ruggedness of common things is clothed and beautified by the charitable mantle of the snow, what curves and shadows in the immaculate folds.

By day and by night, in sunlight and in moonlight, a

dome of purest azure, now pale, now dark, canopies a world of purest white and purest shadow, or earth and sky are blurred in the wild grandeur of a winter storm. Surely the beauty of the world lives even amid the death of winter—it is not death, but beautiful sleep, broken at times by spasms of terrified dreams, followed by profounder sleep.

SKYLARKS.

MR. EDMUND ORGILL, of Tennessee, whom many of the field sportsmen of the eighties will remember as the owner of Orgill's Rush, has an ambition to introduce into his part of the Union the English skylark. His home is in the western part of the State, so convenient to Mississippi that "it's all one"; and the presumption is that the birds would thrive there. Can Mr. Alex. Starbuck or other member of the Cuvier Club tell us what became of the skylarks imported some years ago by German-American citizens of that city? and can Mr. Horace Kephart, of St. Louis, give information about the birds put out there?

SNAP SHOTS.

The bird belongs to a past age, and it is a trifle late in the day to discuss its name. Those who prefer the designation of "passenger pigeon" might make out a good case by citing the fathers and quoting from the dead languages. Audubon, Wilson, Nuttall, Coues and others describe the bird under the name of "passenger pigeon;" and as we have said, it was this name Audubon gave to his charming portrait of the species; although he does say that it was in his day more commonly called "wild pigeon." The scientific name in the books is *Ectopistes migratorius*, and in this nomenclature is embodied a recognition of the passenger characteristics of the bird rather than of its wild nature. *Ectopistes* is from the Greek *ἐκτοπιστής* (ektopestes), "a wanderer" or "passenger;" from *ἐκτοπιζω*, "I wander," "change place;" from *ἐκ*, "out of," and *τόπος*, "place," "out of place." Surely there is "passenger" enough here.

The Latin of the name, *migratorius*, "migratory," repeats the suggestion of passing, wandering; and taking the entire designation, then, it may be said that the use of the term "passenger pigeon" is abundantly justified. Thus as to the authorities. But despite all the writers and all the books, they to whom the bird is a memory—a memory linked with the old days and ways of tender recollection—will remember it and call it by the name they had for it then; and whether this be wild or passenger matters little.

Governor Roosevelt has signed the Dutton bill, which repeals absolutely the law providing a bounty for illegal nets in inland waters. The fault with the law was that the bounties offered were not judiciously graded; they were on such scale as to encourage dishonesty and as to make possible the mulcting of the State treasury. If the scale of rewards originally proposed by Mr. Henry Loftie, of Syracuse, had been adhered to, the purpose of the bounty law might have been attained and its abuses avoided. The public-spirited citizens who have been fighting the netters and fish-pirates of the lakes of central New York will not permit this outcome of the bounty law of 1898 to be the ending of the struggle. If nets can be legislated against, they can be suppressed, and a way will yet be found to take them out of the waters and keep them out.

The attention of Pennsylvania sportsmen is invited to a bill introduced into the Senate (File of the Senate 61) by Mr. Hardenburgh, of Wayne county, and favorably reported from committee by Mr. Scott, of Luzerne county, to permit the sale of grouse, quail and woodcock, and to permit their shipment out of the State, both being now forbidden by law. By a change of the squirrel season to open Sept. 1, a time when game birds are young, it makes their killing easy, and destroys the system of an uniform game season for all species, a system which in Pennsylvania, as elsewhere, is wisest and most satisfactory in its workings. It is gratifying to note, too, that the Board of Game Commissioners is alive to the retrograde nature of the measure and is opposing it. The Board should have the prompt and active co-operation of all citizens of the State who are interested in game preservation.

The Sportsman Tourist.

Off on a Malanga in Samoa.

HOSPITALITY is one of the primitive virtues of savage life. That means that in Samoa it becomes a fixed ceremony, for the Samoan Islander lives in a rigid casing of rules and regulations fixed and unchangeable. Samoan hospitality is not only a duty, with regulations binding on host and guest, it is a function, a form, a ceremony. From the welcoming of the coming to the speeding of the parting guest there is a complexity of speeches to be spoken, gifts to be presented, things to be done. It never is different from one village to the next; having seen the performance in one place, one has seen what it will be in all. This is known in the Samoan speech as a "malanga." It is classed as one of the pleasures of island life. That the pleasure is not entirely unadulterated appears in one verb of the language; the word means to go away. It is applied to one who runs away to the bush when he sees a pleasure party approaching. This is evidence of the fact that hospitality may be irksome, and that duties may be dodged even in savagery.

Sooner or later in a residence in Samoa one is impelled to go on a malanga. Either the unchanging dullness of Apia calls in loud tones for a change of scene, or there is a movement of the common feeling that because you are uncomfortable in one set of surroundings you will find less discomfort in another set, or else some Samoan town has sent a pressing invitation. Whatever may be the reason, the malanga is determined on.

The first thing to do is to send on word ahead that the malanga will start on a certain day; this to give the hosts time to make preparations for the entertainment of the coming guests. A provision of food in savage superfluity is as much a part of all Samoan ceremonies as are the speeches.

The transportation department of Samoan life is the rowboat for distances large or small. It is astonishing to contemplate the smallness of the boats in which people gaily undertake long voyages in Samoan waters; actual sea trips in the ocean itself in a 30ft. rowboat are common. There is no danger, there is a minimum of comfort in such craft. Into such a boat must be crowded a crew of four, at least as many of the after-guard in the stern sheets, a cargo of kegs of beef and tins of biscuit and such bulky provision of gifts and rations. With these the boat is crowded, it appears quite the reverse of safe for a trip out on the unsheltered waters of the Pacific.

Local conditions of the wind determine the time of making the start. If the destination lies down to the westward, the start is made in the morning after 8 o'clock, when the trade wind has set in for the day, and it is possible to hoist a rag of sail and voyage without toil. If the destination lies eastward, the trip begins by night, for in the trade-wind season the nights are calm and there is nothing to retard the boat when the rowers bend their backs to the oars for mile after mile of sea.

Take the case of a malanga to the town of Falefa, which well serve as an example of all such trips. The town has invited its white friends to pay a visit. There is some motive, of course, but what that is will not appear until it is slyly developed in the course of the visit. The town has determined that its white friends shall be its guests; it has all been settled in town council, which has also established the share of each of the people in the event. Some one of the chiefs brings the invitation, either written or by word of mouth. Commonly it is both, for the Samoan dearly loves to write a letter, and the only way of finding out the meaning of a Samoan letter is to ask the bearer what the writer meant to say. By such means the invitation is conveyed. It is accepted for some indeterminate date in the future; it is not considered good form to apprise the bearer of the exact day on which the guests may be expected. That is to be delivered by your own messenger to the town, preceding you by a few days. Those who are wise in the way in which time is ordered for the Samoans time the malangas so as to arrive on Tuesdays whenever it is possible, it being desirable to avoid spending Sunday as the guests of a town, and as Friday and Saturday are wholly used by the islanders in preparing food for Sunday, they are more content if they have no other duties to bother them.

In this case, the trip being to windward, the start is made from Vaiala by night. The Samoan crew are decorated in honor of the event, their hair has been freshly limed and oiled with the fragrance of the "moso'oi," the ylang-ylang. Every man wears a necklace of the red fruit of the pandanus, with a string of sweet-scented leaves. Each has stuck in his hair or over his ear a flower, either the flaming hibiscus or the gold and white of the frangipanni. In their degree the rowers are a part of the pleasure party, and the people to whom the visit is addressed have no idea of anything servile in the relation. Therefore they decorate themselves and the boat; they have a supply of necklaces for the after-guard. Failing such a supply, one or another of the crew plucks off his own necklace and offers it; it may be fairly dripping with the surplus oil which glistens on his bare back and breast, but one gets used to such trifles in the islands.

When the moon is well up and the tide is right, the boat is carried down to the beach and set afloat. The boat captain takes a last tally of the cargo as it is being stowed, for it would be a fatal error to leave anything behind on parting from the vicinity of shops where things may be bought. With a triumphant song the oarsmen begin to row and the boat is off. There are two or three miles of still water; the coral reef a mile off shore has made a still lagoon. But as it is shallow with sand and with gardens of coral, care is needed in steering. Along the shore gleam the lights of a string of Samoan towns, and the villagers, attracted by the boat songs, draw down to the beaches to see what boat it is that is going by, if close enough to shout out in question as to the destination. Gradually the water is found to be deeper, the watching of the channel becomes less taxing, there is not so much coral in the way. After rounding the point on which glisten the lights of the German plantation, the swell of the ocean begins to be felt, and close to a mountain cape the boat passes out from the lagoon into the long course of the rolling waves of the sea. There are

several miles ahead of the course with not a danger of reefs to look out for, and the boys settle down to a long sweep of the oars which develops good speed. The singing continues, old songs of the race, songs of the last war or of the next to come, hymns of the new religion; it is all one to a Samoan crew, so long as they are singing something. After two hours of this progress, easy progress if one is a seasoned sailor, and not affected by the epidemic malady of the sea, the crew begin to look out seaward as though seeking to find some place or thing in the waste of waters. There is a dangerous reef off shore somewhere near by, the "Fale aitu," or House of the Gods, and until that has been sighted there is need of care. It is not easy to find it in the dark, for it is in deep water and breaks only at intervals; still the sea is so tumultuous about it that no mere boat could live. When this has been safely passed, Saluafata is near by, and there must be search for the channel between its reefs. Thence onward for the two or three miles yet remaining the way lies in still waters within the reef, past Saluafata town, out in the sands, which jut out from Lufilufi, the old rebel capital, where the tomb of Tama-see stands boldly forth glistening white in the moonlight, past Faleapuna and around a point to the bay on which Falefa is built.

The destination is reached in the middle of the cool and calm Samoan night, the town sleeps, every house shows the dim glimmer of the lamp which keeps the evil spirits away, and without which no Samoan can sleep in peace. The boys drive the bow of the boat into the glistening sand of the beach, with a loud hoot merging out of the last notes of their rowing song. A Samoan community is used to being aroused by such shouts at any hour of the night. The sleepers awake and come down to the sand to welcome the newcomers. This party being expected, there has been some one left on watch, and the chiefs have gathered in the great guest house as soon as the boat has been sighted at the corner of Faleapuna point. The common people of the crowd upon the shore lead the visitors to the guest house, where a fire is burning briskly, a source of light with no heat. The white people come into the house at its front, the crew bring up the cargo of the boat and stow it and themselves behind the central posts in the inferior station.

On entering, the taupou, the village maiden, stands ready to greet her guests with the foreign handshake, which has almost wholly displaced the salutation of nose laid to nose of earlier and strictly native custom. At one end of the house sit the chiefs of the town, speechless and somewhat solemn in their assumption of dignity. The newly arrived visitors find mats spread for them at the other end of the house and follow the example of their entertainers in sitting cross-legged in silence. The house is decorated for the occasion, a tasteful use is made of simple materials. At every side-post is a single leaf. The collection transforms the house into a bower; that is the advantage of having cocoanuts; one leaf is a large affair when used for decoration. The central posts and the beams overhead are wreathed in ropes of flowers and fragrance. It is not everywhere that one could count on such a reception when coming into a town with shouts and hoots at 2 in the morning. Samoans look upon it as quite in the proper order of things.

There has been a wait; the people are probably glad to see the visitors, but as yet no word of welcome has been said. The wait is governed by rigid courtesy; it is a style of honor—the longer the wait the greater the honor is displayed. But it is broken by a soft voice from the other end of the house. The bright flickering light from the coconut leaflets blazing in the fire pot shows that one of the party is speaking. The fly flapper which he hangs over his shoulder shows him to be orator of the town, whose duty it is to make the speeches which are the greatest factor in Samoan life. His soft undertone is part of his art; he delicately conveys thereby the impression that he is overcome by the high rank of those whom he addresses. His speech is a routine performance, a reiteration of the names of the guests, a repetition of the names of the chiefs of Falefa, a most fulsome expression of the solemn joy and the delight and the pleasure and the happiness and the glee and the gladness with which each chief sees the visitors before him. There are four chiefs in the town, and there are four in the visiting party; that means that there are just sixteen repetitions of this statement of their complicated joy. One of the guests is an American tourist who knows no word of Samoan. He is keen to know what all this talk is about; he is the only one who can awaken interest over a Samoan formal speech. He has been instructed in the etiquette of the occasion, and he listens intently to catch the words "Malo tele," for he has been told that in speaking of "the great government" America is being complimented, and he is very prompt to say "malie," which is the proper acknowledgment of the compliment. Then, at the end of this speech, is another long wait, and the orator of the visiting party tells how glad each one of the visitors is to see each one of the chiefs. That means another set of sixteen paragraphs of long compliment, and the chiefs take their turn in murmuring "malie" when their names are mentioned. Then the town orator has his innings again. Falefa is desperately poor, according to his statement; it is altogether a worthless outfit, and they are bowed down with shame that they are so unworthy of such a high visit, and that they are not able to provide proper entertainment; but they have managed to scrape together a little kava for our drink. A huge root of the dried pepper bush is then laid on the mats in front of the visitors. The other orator enters on an equally long and complicated speech, and offers the kava which the visitors have brought. With many speeches and the employment of some two hours of the night, the bowl of kava has been mixed and the drinks have gone the rounds, the chiefs say a sudden good night, and there is a chance to sleep. Short of a seizure of illness, there is no way of abbreviating all this ceremony.

With the break of day the taupou is at hand to pilot the way to the pool for a bath, for sharp on sunrise the ceremonies begin. The chiefs arrive with their orator for the morning bowl of kava, and an hour is occupied in that function and the slight collation of baked bananas and cold baked fish which the kava ceremony is expected to include. Shortly after this the morning meal is carried in and the village maid eats with her guests. This meal is only for the purpose of supporting life; there is

as nearly an absence of ceremony as it is possible for the formal Samoan to attain.

In the afternoon comes the great ceremony of the visit. The chiefs and rulers of the town call. Like New England women, they bring their work; every one has a hank of fibers of coconut husk, which he industriously plait into sennit. There are more speeches back and forth; all the speeches of the night are repeated and amplified; they take time to include every possible detail. It is not at all uncommon to take anywhere from one to four hours over the purely formal part of the speeches, formulas repeated over and over again and banded back and forth between the orators of the two parties. Then there is more kava, with its set of speeches. By this time the space about the house has filled up with the people of no rank, who may not enter the house, but who have the freedom of the town green, absolute freedom and rigid regard for fixed rank going hand in hand. While the cup of kava is being served a procession moves across the green and up to the guest house, each person carrying food. It is thrown down on the grass in plain sight and the town complains once more of its poverty and its inability to care for its guests as they should be cared for. One of the crew goes to the heap of food and makes a careful count of each article, which he reports to the orator of the malanga. He makes a speech of thanks, in which he enumerates the exact number of pigs, of fowl, of fish, of every single item which has been presented. Then he recounts the extreme poverty of the great government of America, how it suffers for want of the very necessities of life, and is filled with shame at its inability to honor Falefa as it deserves, but there is a keg of beef and there is a tin of hard tack, which is a feeble offering. Then there is another speech—Samoan life is altogether vocal with oratory—and the chiefs get up and go. The orator of the malanga now stands in front of the house and shouts to the world the full tale of the food presented and proclaims that the visitors will eat. At night there is another drinking of kava, and that is followed by a siva, the native concerted dancing of the taupou and 'aualuma, maid of the village and train of her attendant girls. At the end of the dancing, which may last for hours, there is more work for the orators. The malanga makes a present to the taupou, a bolt of calico, a dozen bottles of scent, an assortment of gaudy trifles. The village maid has her orator, the old woman who is her duenna, pipe out a formal reply.

Such is the skeleton outline of the first day of the visit. The others are a repetition of the same elements, talk, food and dance. The malanga is expected to stay three days; to leave before that time is a disrespect to the town and can be excused only by urgent business announced beforehand, so that there shall be no mistake; to prolong the stay is equally improper, and the only excuse is a dangerous gale, which would make sailing unsafe. The presents to be given by the malanga are such as custom has decreed for the white people; to give less would be niggardly, to add to the collection would be to no purpose. The cost of such a trip to a party up to half a dozen amounts to about \$30, covering all expenses of boat and presents.

LLEWELLA PIERCE CHURCHILL.

In Old Virginia.

Part Four.

Fox hunting has become very popular of late years among the residents of the Old Dominion. More correctly speaking, it has been revived. You can find devotees of this sport in almost every county, and many packs of very good dogs are kept. The owners of many dogs can give you the pedigree of their packs as glibly as they can their own; and a Virginian without a pedigree concealed about his person, and set with a hair trigger that will enfilade from "Ego" to Lord Something-or-other down through the F. F. Vs., don't exist.

My observation led me to conclude that to the real genuinely enthusiastic fox hunters there was no other sport. Other so-called sport did not rise above the class of pastimes with them. Real sport was running a fox with good dogs, with any kind of mount that could carry a saddle and go, a good horse to be preferred.

They do not ride to hounds a-la the British aristocracy, taking all obstacles and hurting something or somebody every run, but in a wild, irregular, take-short-cuts-and-dodge-around-obstacles sort of way that is to them the acme of human sport. It is not that they do not ride well, for the Virginians are the best of horsemen, but it is owing to the terribly rough and broken country, and the fact that breaking a good horse's back, even occasionally, is an extravagance that but few can afford to indulge, that they pursue the sport with some degree of caution and moderation. I had never lived in a section of the country where fox hunting was one of the sports, and had always looked upon the fox as a member of the "varmint" tribe, to be summarily disposed of by a load of shot whenever the opportunity offered. This fact caused me to be guilty of a breach of sporting etiquette that all but lost me the good opinion of my hostess on one occasion. We were strolling through the woods one afternoon, for the air and exercise, and had carried a gun, thinking it possible that "Jeff Davis," the dog that had an ancestor with a nose, might tree us a squirrel, when in the distance we heard a pack of hounds in full cry.

They were coming in our general direction, and my companion said they were running a fox. I suggested that we walk out toward an opening in the woods in the direction they seemed heading. To this she agreed, and hurried along with much more enthusiastic haste than the occasion seemed to me to warrant. Arrived at a good point of observation, I slipped out the light shells from my gun, replacing them by some loaded with heavy shot that I happened to have, remarking that I would proceed to stop "sly reynard" if he came our way.

She looked at me in surprise for a moment and then said: "You don't mean you would shoot the fox should he come this way, do you?"

"Why, certainly," I replied.

Looking at me a moment, as though doubting either my seriousness or sanity, she turned back toward the woods, requesting me to follow. Somewhat puzzled, but desiring to be accommodating, I followed obediently, trusting that an explanation would soon be forthcoming.

We had walked some distance in silence, when she turned and asked: "You did not really intend to shoot that fox if the dogs had run it by us, did you?"

Having made it the practice of my life never to lie to a lady—when sure of not being believed—I answered:

"I most assuredly did, unless the brute ran so near that he could be killed with a club, and thus save a cartridge."

"Well," said she, "you are my guest, and therefore I feel in a measure responsible for your personal safety, and I now beg of you, as a special favor, that you never indulge your inclination to shoot a fox that is being run in this country; for as certain as you do the hunters will set their dogs on you and ride you down with as little compunction as they would the most desperate criminal. They would certainly do it, I pledge you my word."

She was perfectly serious, and afterward led me to believe that she was perfectly correct in her ideas as to the probable fate that would befall the man who so outraged the proprieties of the fox hunting code.

My inclination to shoot a running fox never got beyond perfect and complete control while sojourning in Virginia. We all have our preferences in the matter of sports. One pursuit will afford to one man the greatest pleasure and recreation, while it will rank very low in the estimation of another, and yet both may be enthusiastic and orthodox sportsmen. The best sport to one man is quail shooting, when the cover is brown and the air brisk. To another it is duck shooting, when the blind is well placed and the flight good. To yet another it is the big game in its almost inaccessible haunts, while many men say that the rod alone yields perfect sport. I have yet to find any of them that are without their devotees and champions. Personally, with the exception of the so-called sport of prize-fighting and live-bird shoots, I think them all good; but my fondness for fox hunting, like the taste for olives, is acquired.

Talking with Virginia fox hunters soon taught me that to them it was indeed the sport par excellence. They compared it with no other recreation, claiming that it would not admit of comparisons. They lived in the hunting season, and only dragged along in weary "ennui" the remainder of the year. To them the cry of the full pack, the clear call of the horn, and the yell of the eager hunter, is not merely music, it is a ravishment of every sense; a wild, delicious, nerve-thrilling, overpowering intoxication. You may think you have heard enthusiastic sportsmen of the realistic school thrillingly recount experiences; but you have not, is the position and broad assertion of this deponent, unless you have sat in the charmed circle composed of Virginia fox hunters in full cry on old, erstwhile hot trails.

They are a little slow on the start, but they warm up steadily, and the finish is hot, red hot. They invariably generalize on dogs, horses, characteristic foxes and different covers; interspersing this with anecdotes and reminiscences as a starter. Then some one is reminded of some especially glorious run, and starts in to tell about it. There is no great excitement at the outset. The narrator sits comfortably tipped back in his chair, with his cigar going smoothly, while his auditors are disposed about him in the various attitudes that afford the most ease and comfort to their various anatomies, and all seem calm as a May morning.

But after the preliminaries are disposed of, and the hunt is well on, the chair comes down on all four feet, listless eyes begin to glow, every muscle in the narrator's body begins a suppressed play, and the whole scene changes. Every one of his auditors shift their positions, and change expression, and there is a general livening up. But it is when he finally reaches the point in his story where, half out of his chair, and wholly absorbed, he is saying: "I did not make position two seconds ahead of him, although he had been five miles to my three. As I jumped the creek at the foot of the hill—11ft. from bank to bank there, as you know, boys—the mare was neck and neck with him, he having crossed 25yds. below. As straight as a gun-barrel from tip to tip, he ran as though but three minutes, instead of three hours, had passed since we had harked off! And old Blue; gentlemen, that glorious old hound was soyds. ahead of the pack and running as true as a die.

"The other fellows came pounding up as we flew down the grassy bottom that stretches clear for nearly a mile, and every time they split the atmosphere with their yells old Blue and my mare fairly left the ground and took to the air. It was the run of their lives, and nothing like it has ever been seen.

"Old Blue was stretched out about 12ft. long, and seemed flying just a few inches above the ground, with the tip of his nose almost in the brush. The mare never lost a foot of ground, and was running hot in his tracks.

"I knew I ought to pull aside and encourage the pack, but I wouldn't have the weight of my hand on the little mare's bit then for the finest plantation in the State of Virginia. It would have broken her heart to be pulled in that run, for she had put her whole pedigree in it, and was as fresh as paint, in spite of the miles she had scattered behind her that morning. Oh! it was our day, boys, old Blue, the mare and I, and we lived life to the hilt down that stretch!

"The pack and the other fellows were just simply not in it, and we didn't care if they ran it out or not.

"We didn't gain an inch on the fox for the first quarter after crossing the creek, although the old dog was putting in every ounce that was in him, and had never been outrun in the open since he was old enough to run a trail.

"That was a fox, gentlemen; a runner and a stayer; the best that ever wore fur. If it was the last cent of money I ever expected to see, I would give a thousand dollars an acre for a thousand acres stocked with his breed. He was the only one out of one hundred that kept his whole hide three seconds on a fair level run with old Blue.

"It was nearly half across the stretch when the old dog first touched him, and then he slid from under him three times and gained a length every time. If you will believe me, gentlemen, I thought he would actually run clean away from Blue, I honestly did, and was trying to raise another notch in the mare's speed to run him down myself, when the grand old dog made a terrific leap and landed fast, and over they went, fox and dog, end over end, for 25ft., and brought up with old Blue safe up, pinning down the fox by the throat, and the little mare jumped over them both, lighting clear 10ft. beyond."

The finish generally finds the narrator on his feet, with the audience in various positions indicating intense excitement and absorbed interest, and the close is marked by a general return to positions of comfort and a resumption of free respiration.

Listening to a discussion of horses that had become inordinately fond of the sport of fox hunting, I heard the well-authenticated story of a mare, owned by a gentleman in the neighborhood, that had developed such a fondness for hunting that she became almost worthless on account of her extreme sporting tendencies. In every run she was absolutely beyond control from the start until the fox was killed. No bit could hold her, and no obstacle could cause her to quit the chase. When the dogs were gathered or a horn sounded within hearing of her stable in the early morning, she could not be persuaded nor compelled to eat a mouthful until after the hunt was over, and go she would with or without a rider. She had several times broken her halter and kicked off boards enough to get out of the stable when the dogs ran near by, and once free she was invariably "in at the death."

While being saddled to carry her master to his devotions one Sabbath morning, the dogs of a neighbor came by in full cry after a fox that they had jumped when released for a little exercise, and throwing the negro, who tried to restrain her, fully 15ft., she jumped two high fences, took her place close up to the pack, and was found three hours later by friends of her master fully ten miles distant from home, watching the pack worry the remains of the fox, which they had caught and killed.

Her master was finally compelled to send her to a section of the country where fox hunting was not considered in the list of sports, but her memory was certainly kept green, as he never spoke of her except as one loved and lost, but not to be forgotten.

And so man, horse and dog, the greatest and best of the animal kingdom, united their testimony as to the high place that fox hunting should occupy in the realms of sport; but they only succeeded in convincing the side of my intellect subservient to a consensus of expert testimony. My sporting blood failed to respond to the music of the horn, accompanied by the grand chorus of the pack, and other sports, all others, I might say, ranked above that of the chase of the fox.

The change in my sentiments regarding this sport was both unexpected and sudden; but the immediate result indicated that the conversion was genuine and thorough. Rising early one morning, I got down stairs just as the sun was sending his first rays through the thick trees in long, slender bars of gold, on the lawn in front of the house. It was a morning that would cause the heart of an ingrate to fill with silent thanksgiving to the Allwise giver of all the beautiful and good. Standing in the wide, old-fashioned front door, I drank in deep draughts of the ozone-laden air, while my eyes reveled in the beauty of the frost-whitened grass and brilliant-hued foliage. Picking up a target rifle that stood near the door, I stepped out, intending to fire a shot at the first target to offer. Millie was sweeping off the front walk, but was doing so in a perfunctory, preoccupied manner that indicated other and weightier matters engaging her mind. As I approached her she turned and with suppressed excitement gasped out:

"Good mawnin', suh. Don't you heah de dogs? Dey runnin' a fox, an' comin' dis way."

Another devotee of this half-baked sport, I thought, as I strolled on down the walk to the gate that led from the large yard out into the grove in front. I had heard the dogs running something, but had not felt interest enough even to speculate on what the quarry might be, and did not find my interest deepening very fast, although it was evident from the sound that the chase was rapidly approaching us. Turning to glance back at the girl, I found that she had abandoned her sweeping, and, mounted upon a rustic seat, was looking in the most excited manner for the first appearance of the approaching dogs. Having heard that even the negroes showed great excitement over and interest in fox hunting, and that many of them knew all of the dogs that were kept in that part of the country, I called to Millie and asked her if she could see the dogs and tell whose pack it was.

"I can't see um yit, suh," was the reply, "but I know dey is Cap'n Brackett's dogs by dey voices. I've heah dem run offen, suh."

I then heard shouts and loud talk down toward the stable, mingled with the overseer's rush order for his horse, with a sulphurous condition annexed at its non-observance, and realized that somebody had warm sporting blood, even if mine was steadily flowing at normal. Just then a window was hastily raised at the house, and my hostess called to me: "That is a fox the hounds are running, and if you will hurry down and make a boy saddle you a horse you can have a glorious run; don't wait; hurry on at once."

I thanked her, but assured her that as I was not very fond of fox hunting, I would just wait until after breakfast, and then, if the fox was still running around close to the house and convenient to the roads or open country, I would take a hand in the chase. Meanwhile the dogs were steadily drawing nearer and coming in a straight line up through the grove and toward the house. I concluded to try to get a good view of the whole affair as they ran by, and see if it would quicken my sporting blood in the least. Standing in an open space outside the gate, I watched for the first appearance of the fox or pack over a slight rise in the ground several hundred yards distant. The whole forest was ringing with the chorus, and the first surprise was that for the first time I could think of it as it had so often been described to me by over-enthusiasts, as music. It was music, grand and glorious, I thought; and just then a dark shadow slid over the hill and down the gentle slope toward where I was standing, followed—not by "a pack of hounds," as I had mentally concluded—but by "a glorious aggregation of fleet-footed quadruped sportsmen, all singing together the grandest burst of music that ever was heard, while the sun played in golden waves on their brown, black and tan muscle-teeming bodies.

I felt right then that something had been radically wrong with my ideas about fox hunting, and that they were about to be wholly and permanently revolutionized. On they came, in a straight course, that would bring them within 100ft. of where I stood, and the sight grew in beauty, while the music grew in volume and

sweetness. The chase had evidently lasted some time, and both pursued and pursuers were well spent, but the old fox was running gamely, with his brush straight to lee, while the dogs were holding their own in a beautifully compact mass, and the skeptic that had been in front of the gate gave thanks for the grand spectacle and doubted no more its title to sport. Instinctively moving out nearer the point approached by the fox, I was gradually working up excitement that was not anticipated, and therefore not controlled. I finally came to within a few feet of the fox, who did not swerve a foot from his straight course, but ran by me as though his weightier contest waged with his enemies in the rear prevented his noticing any side issues. Then, finding myself so near the fox, and the grand pack laboring so hard in the rear, my new-found enthusiasm burst all bounds, and with a yell that nearly split my throat and caused the fox to jump 2ft. high, I started in on foot to run him down or perish in the attempt. I was fairly beside myself with excitement, and ran as I never had before. I was conscious of a perfect roar of yells from the negroes, who had all run out to see the fox go by, and were now kindly encouraging me, but had the course been Broadway, N. Y., I would have run it just the same in my wild, headlong enthusiasm. No audience could have abashed, no obstacle (not insurmountable) could have stayed me. The many years that I had lived without appreciating the glorious excitement incident to this sport must be atoned for, and my new-found privileges must be immediately enjoyed to the limit.

I had earned a reputation as a sprinter in days gone by, and had a record or two, but nothing ever done in that line was worth mentioning, compared with the run I made in fast company that morning. I thought more than once that I had the fox in the first 100yds., and would probably have closed with him in a rough and tumble if his exhaustion had been sufficient to permit of my actually overtaking him. Straight down through the woods we went, the tired fox leading the wildly excited, newly converted, unduly sanguine enthusiast a close second; the tired dogs third, and the hunters—I remember with gratitude—not in sight. I do not know how far I ran, but when exhaustion compelled me to spare the fox to the tender mercies of the dogs, it took me nearly an hour to work my way back to the house, counting the time that I lay against an old log (that I had run up on after the jump was all out of me, and come to grief over), getting my breath.

I kept the course that we had come for some distance on the return trip, until exhausted by numerous climbs over obstacles that I had probably cleared at a bound while laboring under the excitement of the chase, and then turned out toward the open woods, taking the shortest route to the house. I did not walk very fast on the return trip, and candor compels me to admit that, for once in my life, I was in no great hurry to come into the presence of my hostess. I even felt some diffidence in meeting the servants. Nearing the house, my first greeting was from my solemn young friend "Governor."

"Did you ketch de ole fox, suh," he called out in the most excited manner, and seemed much disappointed when he found I had not. "Ben" was at the woodpile and paused in his work long enough to pay me a very sincere compliment on my "runnin'," which, he assured me, "he sho" was proud to see."

Aunt Ellen came to the door to see me pass by, and her deprecatory smile was the most humiliating yet encountered.

My hostess was sitting on the porch when I strolled around the house, attempting a nonchalant air. One glance at her laughing eyes and preternaturally solemn face was enough to convince me that honest confession was my best course. "Well," said I, "if I had taken your advice and waited for a mount I should probably have stayed in the chase longer, but had less exercise."

"You surely did not let the fox get away, did you?" she asked.

"Most emphatically, I did not 'let the fox get away.' On the contrary, I did everything short of killing myself to prevent his doing so."

"Has this moderate indulgence in the sport changed or modified your views any regarding fox hunting?" she innocently inquired.

"If you will allow me to sit down here on the steps and recover sufficiently from the effects of my so-called moderate indulgence to be able to express myself intelligibly, I promise you that I will, so far as cold words can do so, candidly tell you what I think now of the grand and glorious sport, the sport that excels all other sports as the noonday sun excels the gloom of night, the sport par excellence—fox hunting."

"Good!" she cried, springing to her feet. "You are now orthodox, and we will adopt you as a Knight of the Old Dominion. Sit down and enjoy your well-earned rest while I go and order breakfast served."

I have not "back-slidden" in the faith, but since that morning I try to curb my impatience until a horse is ready when a fox hunt is on, and so far have always succeeded.

LEWIS HOPKINS.

Yukon Notes.

Happenings in December—First Sledding Experience.

OUR shipwreck in the ice jam killed our chance of getting through to Dawson. At first Mac and I could not bring ourselves to believe the gloomy certainty, and we made a start, sledding our supplies down river. While waiting for the river to close we had constructed a sled of spruce, with birch runners, and the Colorado miners had given us another very strong one built of oak and iron shod. With the two sleds, each loaded with a couple of hundred pounds of bedding and supplies, we set out Nov. 22 for the island where our lost boats had stranded. We expected to cover the distance, which was a little more than six miles, in about three hours, but very soon we realized that we should not be able to do it. The sleds had an annoying habit of upsetting every few minutes, and they pulled so hard that we were soon in a profuse perspiration, despite a temperature of 26 below zero.

The first part of our route lay over an Indian trapping trail, which we had chosen as being smoother than the piled up surface of the river. We saw where a wolf had gotten into one of the traps and pulled out the first leap

he made. Later we came on a gray fox crouching close to the ground at the extremity of the chain. The fox was a beautiful creature, with a wealth of deep, soft, fluffy fur of the finest quality.

I felt sorry for the poor animal. It looked more like a pet than the wild creature it was, for it did not show its teeth or snap at us, and the expression of its eyes was mild rather than cunning.

After a time the trail swung further inland, and we left it and lowered our sleds to the ice of the river. Here our real difficulties began. As far as the eye could reach there was not a bit of level surface, and the scene resembled as much as anything the masses of fallen rock one sees at the foot of a slide when covered with a light fall of snow. Moreover, the component ice cakes were bristling with knobs and jagged projections, as a result of their method of freezing while carried along by the rapid current, and even in detail there were no smooth places. Our feet had not been toughened for this kind of walking, and were soon covered with bruises. If we could have worn boots or shoes it would not have been so bad; but the weather was too cold for anything but moccasins.

Our home-made sled soon developed signs of weakness, and before we had covered half the distance to the island one of the runners gave way, and the sled was a wreck. We made up a pack of between 75 and 100 lbs. of its load, and leaving the remainder where it was, continued our journey. It was after dark when we at last reached the island, and we realized more fully than ever the uselessness of attempting to get our supplies through to Dawson. Though only 185 miles away by the shortest route, the windings of a feasible trail made the actual distance to Dawson very much greater. Going and returning, we figured we should have to travel 1,600 miles to get the outfit through, and the condition of the ice made traveling so slow that we should be all winter at the job. With no better protection against the rigors of an arctic climate than a tent, it would go bad with us in case of sickness. Then, too, we were worn out physically and mentally as a result of our previous sleepless struggle against time, and it was a question whether our health would stand such a severe additional tax. Mac and I had gone stale, to use the term applied to athletes who have overtrained. Instead of going at things with snap and vigor, we plodded along listlessly, doing our duty as we saw it, but without a particle of pleasure or satisfaction in the task. We were as stupid and stolid as the worn-out horses back on the Skagway trail.

That night in camp we talked the matter over again, and came to the conclusion that it wasn't any use bucking up against the stone wall of destiny any more. The time required to make the trip was a hopelessly conclusive argument against the sledding proposition. The hardships alone would not have deterred us.

An Inventory of Supplies.

Later we took an inventory of our supplies, weighing each separate article on a spring balance. The weights were afterward confirmed by the platform scales at Fort Selkirk. The result was another knock-down blow, for we found that we had considerably less than half the food we had purchased a little more than three months previously. The supplies given the Colorado miners had made a serious inroad in our scanty stock, but even including these more than half our supplies had vanished.

We had lost nothing on our trip down the Yukon, and the shortage had its origin back on the Skagway trail.

A part of the shrinkage could be accounted for by the fact that on the last half of the trail our personal supplies had been drawn upon for the requirements of the five men who then formed the party; but despite all the allowances we could make for this, and allowing for what we had eaten en route, there was a shortage of fully 20 per cent. from the estimate furnished by the men who made the division.

I am satisfied that Mac and I got all we were entitled to in the division at Summit Lake. The shortage was no doubt largely due to supplies lost or stolen from caches on the horse trail, or at the time of disembarkation from the steamer.

We had been given a wrong estimate, however, made partly by guesswork, and it was a cruel blow to find the food did not exist.

Reducing the situation to its simplest terms, we found our supplies would not last the winter out. When spring came we would have no food and should be unable to accomplish anything. Here was another of the disastrous climaxes that the haste and precipitation of the trail had brought us to.

It would be a tedious waste of space to recount all the plans discussed or the various expedients adopted in the month that followed. It would also be superfluous to describe events of a business nature which influenced our final decision. In the end we sold out our remaining supplies and left for the coast. Mac is back in the Yukon, and I came within an ace of being there too, but that's another story.

Notes from our Diary.

While figuring the thing out we decided to build a cabin. There was no mineral in the neighborhood, and we needed some occupation. Winter is no time for prospecting. It is a good time for staking wildcat claims to take out and sell credulous investors, but no self-respecting man soils his fingers with that kind of thing. After selecting a site on the mainland, we began sledding our outfit to it. We had a day or two of very mild weather, and on Nov. 24 the thermometer rose to zero. When we awoke on the following day, however, it had fallen to minus 45. The snow was then about 18 in. deep on a level, and very light and powdery. On the 26th it was 49 below zero. We had moved our tent to the mainland and pitched it in a very thick growth of small spruces, with boughs reaching all the way down to the ground. The tent had no fly, but we covered the roof with extra pieces of canvas, taken from the boats, and banked up the snow on the sides and part way up the roof. Inside there was a course of logs around the bottom, and the roof was supported by a series of poles resting on crooked sticks.

Nov. 27 the thermometer registered 50 below zero. Owing to the absence of sunlight, the middle of the day was not much warmer than morning and evening. This makes the cold more absolute than in places fur-

ther south, where it warms up in the middle of the day. We were on an east and west stretch of the river and never saw the sun. Instead we had sun-dogs and northern lights and the aurora borealis. If it had been mid-summer, we should have had twenty-two hours of sunlight, and light enough to sight a rifle at any hour of the twenty-four. Some of the miners paint the roofs of their tents black, so that they can sleep during the time of the midnight sun.

As Mac was tying up the flaps of the tent the evening of the 27th, he called to me: "If you're too hot in there, old fellow, you'd better come out here. There's a delicious breeze blowing on the front porch."

Sunday, Nov. 28, the thermometer registered 50 below zero at 12 noon by our time. We had our watches set so that daylight came at about 10 o'clock and dark at four. For the first time in three months we observed the day and did no work. We had some strychnine out for wolves and foxes, but no animals had been near it in the night. I made a snowshoe trip of a few miles inland, but saw no tracks except those of carnivora. My notebook mentions the fact that the snow had almost entirely disappeared from the ground inside the tent, and that we were very comfortable; in fact, too warm when the stove was under good headway.

Monday, Nov. 29, the thermometer stood 54 below. This day was remarkable for two events. We laid the foundation of our cabin and met the first dog team out from Dawson. There were six dogs, attending strictly to business and looking neither to right or left, and three men. The men were clad in fur parkies, and the frost from their breaths had made a rim of ice around the openings of their fur hoods that nearly hid their faces. They mentioned the fact that the thermometer in their possession had registered 65 below zero the night before, and said there would be a big exodus from Dawson as soon as a little snow fell to fill up some of the cracks in the ice. Food, they added, couldn't be had for love or money, and there was bound to be a lot of starvation and suffering before the winter was over. An interesting fact we noted was that these men followed the trail of Lingard and Dartois with all its windings. With judgment they might have shortened the distance 20 per cent.

No snow fell from Nov. 23 to Dec. 2, and trails made several weeks before the 23d had not filled up. The average snowfall was very light, and in the early part of the winter there was no wind. Before the river closed it steamed like a boiling caldron for days. A dense cloud of vapor hung over the river valley and the blue sky was blotted out. This vapor at times made it very difficult to locate rapids, the sound of which was plainly audible. It collected on the trees till the somber spruce forests were white and hoary. It was not until Dec. 31, 1897, when a warm chinook wind came along and blew them free, that the trees resumed their normal dark color. The contrast was striking after nearly two months of glistening frost. We seemed transported to a new country.

Our water hole had been cut in a place where none of the jammed ice had collected. This new ice, which had formed in eleven days, was now 18 in. thick. Water taken from the hole and thrown upon the surrounding ice crackled and snapped like a brisk fire, only louder. Strangely enough, the trees did not make the pistol-shot reports characteristic of cold days in our Eastern forests. The frost in them caused them to snap to a certain extent, it is true, but the noise was more subdued and less frequent than in Maine. For one thing, the trees are smaller, though there are some 16 in. spruces on the islands. The real reason for the difference, however, I think lies in the fact that in the Yukon the frost is practically continuous during the winter, and there is not the alternate thawing and freezing process that takes place in milder climates. The trees were frozen hard as rocks, and one had to be very careful in cutting green wood, or he would lose a good part of the bit of the axe.

Nov. 30 our thermometer recorded 55 below zero. We had compared this thermometer with a very fine instrument, from which Mr. Pitts took official readings, and found that it tallied very closely. We saw a magpie and several ravens. An ordinary hairy woodpecker had been noted a few days before. The other day an agricultural paper stated that severe winters have the effect of killing off the woodpeckers. This may be true, but as far as my observation goes there are few hardier birds.

Weather Conditions.

Dec. 1 was the coldest day of the winter of 1897-98 on the Yukon. Our thermometer registered 57 below zero. Mr. Pitts' registered minus 55, though I believe his reading was taken several hours later in the morning than ours. Other thermometers registered 10 or 12 degrees colder. The winter was unusually mild, though anything below 50 is considered very cold, even for the Yukon. The lowest temperature recorded by Mr. Pitts in four years was 92 below, and that only lasted for a few hours. Sixty-three below had been the coldest the previous winter.

From 20 to 30 below is about the average winter cold. Once in a while the thermometer touches zero, but this is unusual. Sometimes, in years of exceptional mildness, the thermometer goes above the freezing point, as the result of a long-continued south wind. The last day of December, 1897, and first day of January following such a chinook wind raised the temperature to about 36 above zero, and the present writer has seen an even more remarkable warm spell.

Mr. Pitts stated that summer may properly be said to begin June 1.

Cabbages and such vegetables are then set out. Winter sets in on Sept. 25. It is then blustery and cold and a marked sharp change has taken place. The thermometer is apt to fall below zero within a week of that date. Frost is likely to form any night during the summer. July 26 and 27, '96, the ground froze hard, badly frosting potatoes which did not happen to be covered. Mr. Pitts blankets his potatoes cold nights as a rule. He has sheets of drilling all ready to be run out on a pole framework over the beds. Turnips are much more hardy and are a sure crop without this care. All vegetables have to be irrigated at Selkirk.

About the first of December a severe cold snap is generally counted upon. Fortunately, however, the early winter is not apt to be very windy. In January and Feb-

ruary occur periodical wind storms which make traveling disagreeable and dangerous. Naturally more deaths by freezing are recorded in such weather than at other times. The worst thing about the Yukon is not the cold, but the darkness. The cold is healthful and invigorating and can be easily endured by men who know how to take care of themselves. The short, dull, sunless days are, however, very depressing.

Building the Cabin.

Several persons we had talked with had told us we would have a hard time building our cabin in midwinter. They were united in saying that our chief difficulties would be to procure moss for chinking the walls and earth for covering the roof. The Colorado miners gave us a good point, suggesting the use of dry logs only in the construction. Dead logs are much warmer than green because they contain less frost.

We had selected a site for the cabin at no great distance from a place where there were a number of dead spruce trees uprooted by spring freshets of the Yukon. Many of these trees were supported clear of the ground and were dry and seasoned instead of rotten and soggy, as they would have been if they had been on the ground. They were of fair size, averaging 8 or 10 in. at the butt. Some of them would make a couple of logs, though all were knotty and the grain often had a spiral twist similar to white cedar. It was next to impossible to get a nice clear piece, and Mac was several days finding a 5 ft. section he could split into plank for our door.

Mac secured the logs and I built the cabin. The logs were from 13 to 16 ft. in length, and the cabin was about 11 by 13 ft. on the inside. It took us two weeks to build the cabin and furnish it. It was a day's job for Mac to secure five or six logs and sled them. In all we used nearly sixty logs.

We began by clearing away the snow and leveling off the ground as well as we could with pick, shovel and axe. Next two large logs were laid front and back, and for the sides logs 3 or 4 in. smaller in diameter were selected. These latter were cut so that the ends would rest snugly against the front and back logs. This completed the first course of the cabin, which was not notched or fastened in any way. In the second course round notches were cut at each end of the front and back logs directly over the side logs of a depth that would bring the bottom of the notch flush with the top of the side log. The side logs of the new course were then rolled into these notches and back hewed so that they lay snugly against the lower side logs. When a good fit had been secured the logs were rolled back out of the way and a layer of moss laid the entire length of the side. After which they were rolled back into the position they were to occupy permanently and their ends round notched to receive new front and back logs. The principle of this method of construction lies in furnishing a bed for each log as it is required, and it saves any notching of the new log before it is in place. One can also do a better and quicker job laying the moss this way than chinking afterwards.

Greatly to our relief we met with no serious difficulty in securing the moss. The Colorado miners had told us that in Dawson they had to build fires to thaw it out. This may have been due to the swampy location of the Klondike metropolis, for in our locality the moss was not frozen except in the immediate neighborhood of trees or roots which came close to the surface and which attracted moisture from the ground below. I dug enough moss from the space inside our cabin to chink the walls a height of 5 ft., and a few sled loads more secured near by satisfied our requirements. The loose snow was shaken from the moss and the harder portions were pounded flat with a hatchet.

The Problem of the Roof.

The problem of the roof was by no means so easy of solution. To make a good warm roof earth seemed an absolute necessity. No one ever thinks of any other kind of roof in that country. As in the West, the rainfall in summer is very light, and roofs with enough earth on them rarely wet through. Further up the river there is a deposit of volcanic ash that shows in the faces of cut banks as a white band. In the neighborhood of Five Finger Rapids this ash deposit is at least a foot thick. It is so dry that it does not freeze in winter, and, being very close to the surface, it is easily excavated. We knew that this had been used for covering the roofs of houses and for filling in the space between double walls of small logs. We were not able, however, to locate the strata in our neighborhood. We could, of course, have thawed out earth by burning after the manner of working deep claims, but the process seemed too slow and laborious. Finally we hit upon the plan of carrying the same construction used for the walls up into the roof. The cabin was intended for winter use only, and it made little difference whether the roof was waterproof or not. The main thing was to have it tight and warm. At a height of about 5 ft. I began building in toward the center, and as soon as there was good head room inside I laid the logs nearly on a level. The result was a roof shaped like an inverted U, something on the principle of a railway coach. It was tightly chinked and proved thoroughly satisfactory except for the fact that the snow melted and leaked through a little in the immediate neighborhood of the stovepipe.

The roof had a considerable slant to the back, and if necessary we could have thrown a tent over it to keep out the water.

Furnishing the Cabin with Axe and Auger.

The chief article of our furniture was a bed. This was made after a receipt taken from FOREST AND STREAM, and a very good bed it proved.

Four logs were notched and jointed at the corners, the two end ones projecting several inches higher than the sides. The resultant framework measured about 5 by 7 ft. in size.

A canvas bag 5 by 7 ft. was made and loosely filled with the soft ends of the spruce boughs. Two 1½ in. poles were run through the bag lengthwise at the sides. The poles were then attached to the framework of the bed by cleats which held them as far apart as the canvas would permit and kept the canvas tightly stretched. A third pole down the center was required to keep the two-

occupants of the bed from rolling together. When completed it was more of a double cot affair than a double bed, but it enabled us to sleep in the same sleeping bag, which was much warmer than if we had slept singly.

This was the only bed Mac and I had while in the Yukon, and no one ever appreciated a luxury more. We wondered how we had ever managed to sleep on frozen ground, and for several weeks the bed furnished a stock topic of conversation.

Our stovepipe was too short to reach up through the roof of the cabin, and to get connection with the outer air we set the stove up on a wooden stand and added a copper can to the top of the pipe.

The table was made of 2in. saplings. Holes were bored with an inch auger and the pieces fitted in and joined. The top was covered with canvas tightly stretched and tacked. We would have made chairs on the same principle if we had needed them, but we had some boat stools along and other articles which served for seats and did not bother to make any. The door was made of three planks 5ft. long nailed together with cross pieces. Mac made a wooden latch and wooden hinges, which proved strong and serviceable.

Film for Windows.

We had no window, but could easily have made one by cleaning up some of the photographic plates or film we had with us.

In two instances we had the pleasure of adding to the comfort of ladies by giving them film for glazing cabin windows. Four miles up the valley was a little 8x10 log cabin in which were living a newspaper correspondent and his wife, who was not yet out of her teens. This young lady, who was a New Orleans girl, had frozen her feet early in the winter, but a little incident like that didn't spoil her good spirits, and she was bright and jolly and the best of company. Fortunately amputation was not required, but at the time we left she still was obliged to depend upon crutches for getting around.

At Five Finger Rapids we found a Mr. and Mrs. Craft, who had left a prosperous restaurant in Chicago to go through to Dawson and cater for the gold magnates. The jammed river stopped them 300 miles from their destination, and Mrs. Craft was heartily sick of the enterprise and cursed the day she ever left her dear Chicago. The couple were living in a hole in the ground which was roofed over with a tent. Admittance was gained by a rude ladder. It was too cold for the woman to go out for any length of time and she had no diversion whatever. Her nearest woman neighbor was at the Little Salmon, forty miles away. Mr. Craft had just completed a cabin, and they expected to move in a few days. If she only had a window there so that she could look out and see what was going on in the outside world Mrs. Craft thought she could manage to exist till spring. We gave her a strip of film 5ft. long, and there never was a more delighted woman.

Some ingenious persons made windows from old bottles, setting every other one upside down and chinking between with moss.

Speculation at Dawson.

Speaking of windows recalls the high prices paid at Dawson for glazed sashes. Ordinary 2 cent candles for use in the mines brought \$1.25 apiece, and kerosene oil was \$25 a gallon and only to be had at that price as a favor. The saloons had a practical monopoly of it, and toward springtime they ran out of oil and had to burn candles. As a result of the high prices for artificial light the price for glass went up. If a man had no window in his cabin he would have to burn some kind of a light part of the time during the day. A window was a real economy at almost any price.

Frank Slavin, the ex-pugilist, told me that early in the season he paid \$70 for an eight light sash, and before he reached his cabin he was offered \$100 for it. At Sheep Camp, on the way out, we met a Brooklyn man by the name of Behrens, who had just come out from Dawson. He had bought three building lots in Sheep Camp and was putting up a hotel. He said that he landed in Dawson late in the summer with 2 cents in his pocket, which was worse than nothing in a country where two bits, or a quarter, is the smallest change, and within three weeks he had cleared \$1,700 speculating in supplies.

Here is a sample of his method of doing business. He found a man who had just come down river with three small sashes of window glass in his boat. Each sash had four panes of 7x9 glass. He asked the man what he would take for them. The man said that he did not care to sell, that he wanted the windows for his own use. Behrens jollied him a little and ended by offering \$50 in gold for the sashes. The man did not know prevailing conditions in Dawson and thought that he could afford to do without them at that price. A day or two afterwards Behrens sold the sashes for \$300.

There was a good demand for vinegar, lime juice and other anti-scorbutics prompted by the danger of scurvy. Behrens found a man who had a half pint bottle of concentrated vinegar. It was put up on the principle of root beer extracts and guaranteed to make twenty gallons of vinegar when mixed with water. Behrens bought in the concentrated form and paid 50 cents, and he sold on the diluted basis at a dollar a gallon and received \$20. This transaction netted him 4,000 per cent. profit. There are few gold mines that can beat that. Unfortunately for Behrens, his season of speculation soon came to an end with the closing of the river.

J. B. BURNHAM.

How to Skin an Eel.

In endeavoring to do my turn, in giving a little information here and there, that may come handy some time, I beg you to publish this:

The eel is a creature not very pleasant to handle, and not "everybody" knows how to skin him. The first thing to do is to catch your eel, then lay him on his back and cut half-way through the neck, say 1½ in. below the tip of the mouth. Then rip open the belly and clean it out. Then bend the head toward the back and get hold of the "backbone" and flesh together, with a knife and with the other hand pull on the head, and the skin will come off as easily as pulling off your glove.

W. T.

Natural History.

Flying Squirrels as Pets.

IN May, 1897, while walking in the woods with a friend, we found a hollow birch stub, which we pushed against, more in curiosity than in expectation of finding anything in it. Out flew a female flying squirrel, and four baby ones, which I thought must be about a month old, tumbled after her and started in all directions. We were fortunate enough to catch all the little ones, and putting them in a handkerchief we secured the ends with an elastic band, and I put the little parcel in my pocket.
